Energy Research Abstracts

Abstracts 22649–25476

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers is collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection containing over three million citations represents a major national resource of scientific and technical information. In addition to information acquired from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from Europe, Japan, Canada, and the United States; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, radioactive waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 14-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors who have OSTI deposit accounts can obtain *ERA* (regular issues and annual indexes) from the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Doris M. Henline
Technical Editor, Milton O. Whitson

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Canada
- Denmark
- Finland
- France
- Federal Republic of Germany
- Italy
- Japan
- The Netherlands
- Norway
- Spain
- Sweden
- Switzerland
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

54 (DOE/ER/60888-1-Vol.1, pp. 115-117) **Investigation of air pollution in house due to use of various fuels.** Luo, Dayu (Chengdu Sanitation (China)). Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in 30m^2 air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts.* Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438– T1 15:18494 NTIS, OSTI E 1.99: DE89007246 MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT
- 03 Preparation
- 04 Processing
- 05 Products and By-Products
- 06 Properties and Composition
- 08 Waste Management
- 09 Environmental Aspects
- 10 Reserves, Geology, and Exploration

Energy Research Abstracts

01 COAL, LIGNITE, AND PEAT

22649 (KTM/E-B–122) **Finnish industry as users of IEA Coal Research Services.** Jyrkoenen, H. (Imatran Voima Oy, Vantaa (Finland)); Moring, K.; Partonen, S. Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. 1993. 23p. (In Finnish). Project KTM-48/881/91. Order Number DE93794855. Source: OSTI; NTIS.

Imaran Voima Oy investigated, upon commission of the Ministry of Trade and Industry, the use of the services supplied by the IEA Coal Research, the usefulness of these services for Finnish firms and the extent to which Finnish firms would be interested in involved in the activities of the body and in funding its activities in Finland. Besides the cooperation in terms of the IEA Coal Research, the report covers any such other cooperation projects for the dissemination of energy research information in which the Ministry of Trade and Industry is involved. The majority of the firms consulted were aware of the operations of the IEA Coal Research and one-third of the firms had taken part in its seminars in Finland. The publications of the IEA Coal Research were found to be high standard and 70 % of the respondents felt that these publications current reviews had benefitted the operations of these firms. The same information can be obtained from other sources but not without extra efforts. Respondents valued the fact that the information in the reports is gathered in one place. The details supplied on Finland in the reports were mostly correct at the time of their publication though they had lost part of their currency by the time this survey was carried out in January 1992. In order to be constantly useful, the data bases should be updated frequently enough and be circulated to the users. The data bases would be even more helpful if they were available in magnetic form. For a Finnish user the reference data base is located in a wrong retrieval system. The same reference data are to be found in the ETDE Energy Data Base.

Progress is identified in the following items reported as significant findings for the January 1993 reporting period: In Task 2, revisions to the dewatering topical report were started. In the Task 6 froth flotation work, Pittsburgh seam minus 28 mesh size and specific gravity analyses are complete, and analysis for the 100 mesh tests continued. Illinois No. 6 testing continues. In the Task 6 Coal Liberation work, ash analysis of 134 different composition/size fractions produced by the crushing of the 6M x 8M sample were completed.

22651 (DOE/PC/91290–T5) **Non-intrusive measurement of particle charge: Electrostatic dry coal cleaning: Technical progress report No. 6, October 1, 1992–December 31, 1992.** Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91290. Order Number DE93014970. Source: OSTI; NTIS; GPO Dep.

Triboelectric charging/electrostatic separation experiments were performed using mineral pyrite, spherical silica, two coals and a carbon-silica spherical particle mixture. Two dimensional particle velocities in the separation chamber, as well as the number density distribution, were measured by a laser Phase Doppler Particle Analyzer (PDPA) for different tribocharging loop velocities (6–15 m/s). Particle deposition on the separation chamber's cathode and anode as well as the material passing through the separator were collected, weighed and analyzed to determine the separation efficiency. Typically, for a feed coal with 11 % ash, the coal recovery was around 70–95% with an ash content of about 4%. Deposits on the anode accounted for approximately 20% of the total feed weight and contained about 20% ash, while the cathodedepositions accounted for 70–90% of the total feed and contained less than 4% ash. Approximately 10–15% of the feed did not accumulate on either electrode and was collected at the bottom of the separation chamber. The net electric current induced in the copper charging loop when transporting coal particles (size range 38–45 microns) was much less than that for single component particles such as silica. This may bedue to a charge cancellation effect as a result of mineral matter and coal charging oppositely.

22652 (DOE/PC/92205–T2) **Bench-scale testing of the multi-gravity separator in combination with Microcel: Second Quarterly report, January 1, 1993–March 31, 1993.** Virginia Center for Coal and Minerals Processing, Blacksburg, VA (United States); Carpco, Inc. (United States); Roberts and Schaefer Co., Salt Lake City, UT (United States); Consolidated Coal Co., Library, PA (United States); Kerr-McGee Coal Corp., Oklahoma City, OK (United States). 30 Apr 1993. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92205. Order Number DE93014972. Source: OSTI; NTIS; GPO Dep.

Work this quarter focused on the development of the engineering design specifications for the ET Test Circuit. Process flowsheets and detailed equipment specifications were finalized. Based on this information, bid packages were assembled and purchase orders were issued for all of the necessary process equipment. The design and procurement information is summarized in the ET Circuit Design Report submitted to the DOE's COR this quarter. Final drafts of the ET Circuit - System Safety Analysis, Nuclear Density Gauge - System Safety Analysis and Operating Manual/SOP were also completed and submitted to the COR this quarter. Preliminary characterization studies were also initiated this quarter. Tests were conducted to determine the grinding conditions required to achieve the desired particle size distributions for the characterization work. Flotation release analysis tests were conducted on both the Pittsburgh #8 and Illinois #6 seam coals as a function of grind size. The primary objective of the proposed work is to design, install, and operate an advanced fine coal processing circuit combining the Microcel and Multi-Gravity-Separator (MGS) technologies. Both of these processes have specific advantages as stand-alone units. For example, the Microcel column effectively removes ash-bearing mineral matter, while the MGS efficiently removes coal-pyrite composites. By combining both unit operations into a single processing circuit, synergistic advantages can be gained. As a result, this circuit arrangement has the potential to improve coal quality beyond that achieved using the individual technologies.

22653 (DOE/PC/92207–T1) **Bench-scale testing of on-line control of column flotation using a novel analyzer: Quarterly technical progress report, September 21, 1992–December 31, 1992.** Process Technology, Inc., Calumet, MI (United States). 22 Jan 1992. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92207. Order Number DE93015051. Source: OSTI; NTIS; GPO Dep.

This document contains the first quarterly technical progress report for PTI's Bench-Scale Testing Project of a circuit integrating PTI's KEN-FLOTETM Column Flotation Technology and PTI's On-Line Quality Monitor Control System. The twelve-month project will involve installation of a 300 lb/hr. bench-scale testing circuit at PETC's Coal Preparation Process Research Facility (CPPRF) and testing of two bituminous coals (Upper Freeport and Pittsburgh No. 8 Seam Raw Coals). Figure 1 contains the project plan as well as the approach to completing the major tasks within the twelvemonth project. The project is broken down into three phases, which include: Phase I - Preparation: The preparation phase was performed principally at PTI's Calumet offices from October through

December, 1992. It involved building of the equipment and circuitry, as well as some preliminary design and equipment testing. Phase II - ET Circuit Installation and Testing: This installation and testing phase of the project will be performed at PETC's CPPRF from January through May, 1993, and will be the major focus of the project. It will involve testing of the continuous 300 lb/hr. circuit. Phase II - Project Finalization: The project finalization phase will occur from June through September, 1993, at PTI's Calumet offices and will involve finalizing analytical work and data evaluation, as well as final project reporting. This quarterly progress report principally summarizes the results from the Phase I preparation work and the plan for the early portions of the Phase 11 installation and commissioning, which will occur in January and the first week of February, 1993.

22654 (DOE/PC/92543–T2) **Micro-agglomerate flotation for deep cleaning of coal: Quarterly progress report, January 1–March 31, 1993.** Chander, S.; Hogg, R. Pennsylvania State Univ., University Park, PA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92543. Order Number DE93014968. Source: OSTI; NTIS; GPO Dep.

We are investigating the use of a hybrid process, Micro-agglomerate flotation, which is a combination of oil-agglomeration and froth flotation. The basic concept is to use small quantities of oil to promote the formation of dense micro-agglomerates with minimal entrapment of water and mineral particles, and to use froth flotation to extract these micro-agglomerates from the water/dispersed-mineral phase. Since the floating units are agglomerates (about 30–50 μm in size) rather than individual coal particles (1–10 μm) the problems of froth overload and water/mineral carryover should be significantly alleviated.Micro-agglomerate flotation has considerable potential for the practical deep cleaning of coal on a commercial scale. In principle, it should be possible to achieve both high selectivity and high yield at reasonable cost. The process requires only conventional, off-the-shelf equipment and reagent usage (oil, surfactants, etc.) should be small. There are, however, complications. The process involves at least five phases: two or more solids (coal and mineral), two liquids (oil and water) and one gas (air). It is necessary to maintain precise control over the chemistry of the liquid phases in order to promote the interfacial reactions and interactions between phases necessary to ensure selectivity. Kinetics as well as thermodynamic factors may be critical in determining overall system response.

22655 (DOE/PC/92547–2) **Studies of incipient oxidation of coal-pyrite for improved pyrite rejection: Technical Progress report, January 1, 1993–March 31, 1993.** Yoon, R.H.; Richardson, P.E. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Mining and Minerals Engineering. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92547. Order Number DE93014976. Source: OSTI; NTIS; GPO Dep.

To foster the development of advanced coal cleaning technologies, the initial stages of pyrite oxidation are being studied. The voltammetry behavior of polished pyrite at moderate overpotentials is known to be dominated by iron oxides and hydroxides that are generated during the polishing process. The present work is being done on pyrite surfaces that are freshly fractured in an electrolyte solution. The creation of fresh surfaces by in situ fracture allows studies of the initial oxidation of pyrite itself, without complications from overlayers of iron oxides and hydroxides produced by polishing. Chronoamperometry immediately after fracture and subsequent cyclic voltammetry is being used to elucidate the initial oxidation reaction that produces hydrophobic sulfur species on pyrite.

22656 (DOE/PC/92550–2) **Evaluation of hyperbaric filtration for fine coal dewatering: Second Quarterly technical progress report, December 1, 1992–February 28, 1993.** Parekh, B.K. (Kentucky Univ., Lexington, KY (United States)); Hogg, R.; Fonseca, A. Kentucky Univ., Lexington, KY (United States). 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92550. Order Number DE93015063. Source: OSTI; NTIS; GPO Dep.

The normal practice in the coal preparation plant is to remove the water from the fine coal slurry by vacuum filtration and drying. Conventional vacuum filtration typically produces filter cake moisture containing in the range of 25 to 30 weight percent from minus 28 mesh coal slurries. Although the desired product quality can be obtained by using thermal dryers, there are problems associated with these equipment such as high capital costs and the greatest potential source of air pollution in a coal cleaning plant. In the present research project, an alternative to thermal drying, hyperbaric filtration which has shown potential in lowering moisture content in fine coal to about 20 percent level, is being investigated in detail. This project will essentially focus on developing fundamental information on particle-liquid interaction during hyperbaric filtration and applying the knowledge in developing optimum conditions for the pilot plant testing of the hyperbaric filter system.

22657 (ETDE-mf–93796884) **Flotation of coal < 20 μm in centrifugal force field.** Bothe, C. Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany). Fakultaet fuer Bergbau, Huettenwesen und Maschinenwesen. 13 Aug 1992. 205p. (In German). Order Number DE93796884. Source: OSTI; NTIS (US Sales Only).

In this work a new type of flotation centrifuge was developed and examined in which the separation of the particle/bubble units from the slurry occurs in a transverse flow arrangement in the centrifugal force field. The slurry flows in a vertical conical full jacket centrifuge in a thin suspension film to the centrifuge outlet at which the bubbles rising at the film surface are separated from the slurry by an annular cutter. The deposition of the hydrophobic solid components is done in a special gasification reactor outside the centrifuge. This arrangement achieves large scale decoupling of the above flotation part process. The separation occurs in the centrifugal force field in calm flow. To examine the flotation process in the centrifuge, different hard coals with particle sizes smaller than 20 μm were used. (orig./HS).

22658 (OCDO–93013796) **A novel three phase fluidized bed process for simultaneous selective flocculation and microbial desulfurization of high sulfur coal: Final report.** Fan, Liang-Shih (Ohio State Univ., Columbus, OH (United States)); Bavarian, F.; Attia, Y.A.; Elzeky, M. Ohio Coal Development Office, Columbus, OH (United States); Ohio State Univ., Columbus, OH (United States). 16 Oct 1990. 152p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 High Street, P.O. Box 1001, Columbus, OH 43266-0001 (United States).

The purpose of this work was to investigate the feasibility of recovery and reclamation of ultrafine coal particles generated during the processing of coal. 10–35% of the total annual tonnage of coal in atypical coal preparation plant is estimated to be lost in forms of ultrafine particles during the mining, shipping, handling, and preparation of the coal. The technical feasibility of the proposed system which consisted of an integrated circuit of selective flocculation followed by microbial desulfurization, has been tested. The results indicate that using selective flocculation/froth flotation circuit, coal recoveryis 85% with 75% pyritic sulfur and 60% ash rejections. The remaining pyritic sulfur in the coal slurry was treated using microbial desulfurization in a draft-tube fluidized bed bioreactor. Using this reactor scheme considerable enhancement of the bioleaching rate was obtained. The results indicate that 90% rejection of pyritic sulfur can be achieved in less than 24 hrs. Note that the previously reported data for the bioleaching rate are from 4 to 12 days for the same amount of pyritic rejection. The results obtained in this work closely reflects the anticipated outcomes which were projected in the original proposal. Consequently, the results of this work implies a significant improvement in bioleaching process and the possibility for the commercialization of the microbial desulfurization process. Our results also indicate further improvement of this process by optimization of reactor sequence and operating conditions.

(United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC02-76CH00016. (CONF-930364–3: Spring national meeting of the American Institute of Chemical Engineers, Houston, TX (United States), 28 Mar - 1 apr 1993). Order Number DE93012528. Source: OSTI; NTIS; GPO Dep.

A-step synthesis of methyl formate, a C2 oxygenate, has been developed at BNL. The following features of the LLTMeOH technology and related studies are of interest: The BNL approach exemplifies a synergistic effect of two combined catalysts. The chosen reaction conditions favor methyl formate synthesis. The only identified by-product is methanol. The effect of stirring speed, temperature, solvent, catalyst loading, and syngas composition is noted.Of particular interest is a run with H_2CO = 37%/63% in which methyl formate selectivity approached 100%. Bases ($K_2CO_3KHCO_2$, $KOCO_2Me$) other than alkoxide have been used for methyl formate synthesis. A gas phase infrared mechanistic study of methanol carbonylation reaction, carried out with methoxide catalyst at 130°C under 1/1 (H_2CO) syngas, showed that the fast alkyl formate anion formations was followed by an extremely slow protonation step. It appears that under these conditions, protonation step is rate determining (RDS). This approach results in enhancing carbon conversion of syngas derived from coal or other sources that produce CO-rich gas.

22660 (CONF-891001–13) **Use of promoters to enhance hydrodenitrogenation and hydrodeoxygenation catalysis.** Hirschon, A.S.; Ackerman, L.L.; Laine, R.M.; Wilson, R.B. Jr. SRI International, Menlo Park, CA (United States). [1989]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79936 ;FG22-83PC60781 ;FG22-85PC80906. As the supply of cheap petroleum products diminishes, we will be increasingly dependent upon alternate feedstocks such as coal. Coal, and liquids produced from coal, are highly aromatic and contain much higher levels of heteroatoms such as nitrogen, sulfur, and oxygen than do petroleum based materials. These heteroatoms must be removed before the liquids can be upgraded into useful products. However, the current catalytic processes used to remove nitrogen and oxygen consume excessive amounts of hydrogen due to concurrent hydrogenation of aromatics. Most catalysts have been optimized for petroleum products and little work has been undertaken for the catalytic upgrading of coal based liquids. Catalysts that could economically promote cleavage of the heteroatom bonds while minimizing the hydrogenation reactions would greatly aid in making synthetic fuels a more attractive energy source. We have modeled C-N bond cleavage by examining homogeneous catalysis of the amine transalkylation reaction. The best catalysts for this reaction are ruthenium and osmium, while the metals used in conventional hydrotreating catalysis, nickel, cobalt, and molybdenum, are essentially inactive. From a study of bulk metal HDN studies we have found that ruthenium is one of the most reactive metals for C-N bond cleavage, although susceptible to sulfur poisoning However, by using this metal as a promoter with common hydrotreating catalysts such as NiMo, CoMo, and NiW, we have been able to prepare sulfur tolerant catalysts that exhibit high HDN activity, while at the same time undergoing minimal hydrogenation reactions. In this work we have compared several of these promoted catalysts for HDN and HDO reactivities as a function of composition, method of formation, and support.

22661 (CONF-891001–14) **Weak links and interfacial chemistry in coal.** Ross, D.S.; Hirschon, A.S.; Green, T.K. SRI International, Menlo Park, CA (United States). [1989]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79936. From 1989 international conference on coal science; Tokyo (Japan); 23-27 Oct 1989. Order Number DE93012936. Source: OSTI; NTIS; GPO Dep.

It has been estimated that the ultrafine mineral component in coal can be up to 15% of the total mineral content (ref 6), and the similarity of our results with coal to those for oil shale suggest that the reactive mineral/organic interfacial volume in coal could be substantial. While the mechanisms for reactions within the interphase are yet to be developed, our results suggest that attention be applied to this feature of coal in considerations of structure effects on both liquefaction and coal pyrolysis.

22662 (CONF-9207203–, pp. 75-79) **Non-covalent bonding in coal strucutre and novel applications.** Sanada, Y. (Hokkaido University, Sapporo (Japan). Faculty of Engineering). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Study was made of non-covalent bonding in the coal structure and its applications to the coal-utilizing reaction. When absorbance measurement is made of electron spin resonance of coal to which iodine is added of a high electron-accepting power, the heightening in spin concentricity becomes large and the indicated interaction with iodine does strong with heightening in coalification rank of coal having a developed aromatic condensed ring structure. However in case of adding tetracyanoquinodimethane (TCNQ) which is of the same type of electron acceptor, the heightening in spin concentricity becomes large with lowering in coalification rank of coal. It is because the TCNQ has a strong interaction with the hydrogen bonding of low coalification rank coal. Knowledge of molecular association force can be obtained through adding the electron acceptor to the coal. Among the non-covalent bondings, the hydrogen bonding is important for the low coalification rank coal while for the high coalification rank coal, importance consists in cohesion by the interaction of electric charge's moving type and π-π interaction by the aromatic condensed ring structure. Proposal is made of many applications such as improvement in extractability by driving a molecular wedge like TCNQ's into the non-covalent bonding portion during the extraction of coal solvent and heightening in quick thermal decomposition tar yield by swelling with tetralin which is a solvent of hydrogen-donating type. 12 refs., 6 figs., 1 tab.

22663 (CONF-9207203–, pp. 82-85) **Active species in Zn-butyl iodide system for coal solubilization.** Yoneyama, Y. (Toyama University, Toyama (Japan). Faculty of Engineering); Gonda, K.; Mizutani, M.; Kato, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Dibutylzinc (Bu2Zn) and butylzinc iodide (BuZnI) were synthesized to investigate solubilization effect of coal. The two kinds of butyl zinc compounds were synthesized using methods by Noller and Blaise et al. Coal butylation was carried out on Yubari coal using a predetermined amount of Bu2Zn and BuZnI under nitrogen atmosphere. When the Yubari coal was treated by BuI and supernatants in which BuZnI should be dissolved into Bu2Zn, butylated substances and benzen solubles were obtained at yields of 200% and 97% respectively, the result being the same as with a butyl iodide system. This fact clarified that the active species in the zinc-butyl iodide system are Bu2Zn, BuZnI and BuI. From a fact that the coal was solubilized very highly with the supernatant and BuI, the coal solubilization with Bu2Zn and BuI is defined that BuZnI is created during the reaction, and then dissolved into Bu2Zn to produce the supernatants. 5 refs., 3 figs., 2 tabs.

22664 (CONF-9207203–, pp. 92-95) **On the chemical structure of bituminous coals giving high extraction yields.** Takanohashi, T. (Tohoku University, Sendai (Japan). Institute for Chemical Reaction Science); Kaneko, H.; Iino, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Researches have been made on structure of bituminous coals applying a solvent extraction process. The experiment consisted of CS2-NWP mixture solvent extraction, swelling measurement and size exclusion chromatography using macro molecular coal gel. Bituminous coals of 85 C% to 88 C% ranks such as the Zao Zhuang coal, China, are thought to have both extracts and residues formed

with macro molecular components. It is believed in a solvent extraction that the extracts are removed as a result of release of non-shared bonds betweeh coal molecules and large swelling of the coal because of solvent penetration, and that the remaining residues have a structure maintaining adequate cross-linking density according to the extraction factors. A column filled with pulverized extraction residues was connected to a liquid chromatography to investigate dissolution behavior of standard polystyrene test samples. It is seen that samples with molecular weights of about 10,000 or more are separated at an extraction factor of 25.6%, and those with molecular weights of about 1,000 or more at an extraction factor of 5.2%. However, further discussions are required when viewed from the size exclusion mechanism. 4 refs., 2 figs., 2 tabs.

22665 (CONF-9207203–, pp. 96-100) **Boiling point prediction of coal derived oil by group contribution method.** Sato, M. (Hokkaido University, Sapporo (Japan). Faculty of Engineering); Tanaka, A.; Yokoyama, S.; Sanada, Y. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Boiling points of hetero compounds in coal derived oil were inferred using a group contribution method. From the relation between structural parameters for hetero compounds and their boiling points, effects of each structural parameter on the boiling points were considered, and a boiling point inference formula for hetero compounds was derived therefrom. Test samples of the coal derived oil are solvent fractions from Wandoan coal as a raw material. Hexane was used to sort out the fractions into hydrocarbon compound classes according to the number of aromatic rings, using HPLC. The fractions were classified into three hetero compounds while adding chloroform, and the compounds were analyzed for GC/MS, and their structures analyzed. The boiling point for the hetero compounds is the one for hydrocarbon being a skeleton structure of the hetero compounds given with consideration on its contribution to the boiling point of a characteristic atom group. Because δBH_{OH} (phenolic hydroxyl group of hetero compound as characteristic atom group) vary wholly depending on a displacement position of side-chain alkyl group, correlative coefficients obtained from a regression analysis are not very accurate. The relation between the chemical structure and the boiling points of the hetero compounds was made clear as had been done on hydrocarbons. 5 refs., 3 figs.

22666 (CONF-9207203–, pp. 111-114) **Effect of asphaltene in bitumen on co-processing of coal/bitumen.** Kondo, T. (National Institute for Resources and Environment, Tsukuba (Japan)); Matsumura, A.; Saito, I.; Ukegawa, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Discussions were given on effects of asphaltene in bitumen during co-processing bitumen and coal on coal inversion rates, hydrogen consumption, and reactive products. Cold Lake tarsand bitumen was divided into asphaltene and de-asphaltene oil, then both components were mixed at a predetermined ratio to make bitumen with different asphaltene concentrations, and a mixed hydrogenation was conducted with Taiheiyo coal. It was made clear that the coal inversion rate can be maintained high by using oil-soluble MoDT with high dispersibility even if the asphaltene concentration is considerably high. However, TI and HI inversion rates decrease as the asphaltene concentration increased. Gas yield also increases, affecting the oil yield. Stability of the oil thus obtained is better with the less the asphaltene in the material bitumen, but would not have much of a problem even if the asphaltene concentration is as high as 50%. 3 figs., 2 tabs.

22667 (CONF-9207203–, pp. 115-118) **Coprocessing of coal with heavy oil over composite catalysts.** Miyake, M. (Osaka University, Osaka (Japan). Faculty of Engineering); Higashine, J.; Kido, A.; Nomura, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

With an objective to develop catalyst systems most suitable for coprocessing reaction, discussions were given on using coal and heavy oil having largely different properties in combination with catalysts thought to have functions suitable for making the coal and heavy oil lighter in gravity. The catalysts used were molten salts of multi component metal chlorides developed for coal liquefaction, compounded with Ni-Mo/Al2O3 for reducing gravity of the heavy oil. The coal samples were Wandowan coal and Akabira coal, and the heavy oil sample was Athabasca oil sand bitumen (AOB). Using NiCl2-LiCl-KCl catalyst simultaneously with the Ni-Mo/Al2O catalyst suppressed gas generation, and provided a highest Hs and a lowest BI, wherein composite catalytic effect emerged. Presence of an Ni-Mo/Al2O3 catalyst having high hydrogenation activity hydrogenates effectively fragment radicals of the coals decomposed by the molten salt catalyst and stabilizes the products. These should have resulted in increasing the HS yield and decreasing the BI and gas yield. 3 refs., 5 figs., 2 tabs.

22668 (CONF-9207203–, pp. 119-122) **Separate coprocessing of coal and oil.** Fujimoto, K. (The University of Tokyo, Tokyo (Japan). Faculty of Engineering); Aimoto, K.; Asano, T.; Nozaki, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

A hydrogen transfer pyrolytic process is proposed as a process to obtain decomposed product oil that consumes little hydrogen and has good properties from such heavy gravity carbon resources as vacuum residual oil and oil sand. Using catalysts obtained by loading activated chars made from brown coal into metals, decomposing reactions were performed varying coal types, reaction conditions, and heavy oil types. The hydrogen transfer pyrolytic process uses as its basic reaction transfer of hydrogen from coke precursors to light gravity components as a result of pyrolysis and effects of catalysts. As a result of the experiment, it was made clear that heavy oil decomposing reactions result in large differences because of types of carbon species used as a carrier. HP-C, which has high hydrogenation capability and extremely low coke yield, may be used as a carrier for a desulfurizing catalyst. On the other hand, a carrier made from Yallourn coal through activation treatment achieved extremely high catalytic activity. Thus, light gravity fraction can be obtained from vacuum residual oil at a high yield with an inexpensive catalyst, that is, the combination of brown coal, an abundant resource, with a small amount of iron. 3 figs., 2 tabs.

22669 (CONF-9207203–, pp. 123-126) **Fe(CO)5/sulfur-catalyzed coal liquefaction using steam or alcohol as hydrogen source.** Watanabe, Y. (Kyoto University, Kyoto (Japan). Faculty of Engineering); Yamada, H.; Kawasaki, N.; Wada, K.; Mitsudo, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The paper studies coal liquefaction using steam or alcohol as hydrogen source under pressurization of carbon monoxide and finds that when Fe(CO)5/S system is used as catalyst precursor, liquefied product is obtained at an extremely high yield. Coal liquefaction under carbon monoxide in the autoclave is conducted with Yallourn and Wandoan coals added with a certain amount of steam or alcohol, and a catalyst precursor. The Fe(CO)5/S catalyst system indicates high activity in coal liquefaction using water/carbon monoxide as hydrogen source, and it is clarified that control of the amount of water and reaction temperature enables attainment of high liquefaction yields and oil yields at the same time. On the other hand, Fe(CO)5/S catalyst is found to be effective also in coal liquefaction using alcohol/carbon monoxide as hydrogen source.

Since liquefaction yields are expected to improve by addition of alcohols to coal, a process using mixed alcohols easily obtained from synthesis gas may be possible. 7 refs., 6 figs.

22670 (CONF-9207203–, pp. 127-130) **Structure and reactivity of Wandoan coal liquid residue and design of complete conversion of Wandoan coal.** Sakanishi, K. (Kyushu University, Fukuoka (Japan). Institute of Advanced Material Study); Honda, K.; Kishino, M.; Mochida, I. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The paper examines reactivity in hydrogenation treatment of coal liquefaction residue and makes analyses of structures of asphaltene in the liquefaction residue and asphaltene in products by hydrogenation treatment. Moreover, direct liquefaction of Wandoan coal by solvent hydrogen transfer/catalytic hydrogenation is carried out for complete conversion. The liquefaction residue and coal are made dry. Coal is deashed in 1 normal hydrochloric acid by reflux treatment. By non-catalyst/solvent hydrogen transfer solubilization, asphaltene decreases to 22 wt% and oil increases to 51 wt%. Accordingly, oil increases also by reaction with hydrogen transfer in liquefaction system as main reaction. In the second stage liquefaction of catalyst hydrogenation after this, HS and HI-BS increase to 71% and 24%, respectively, and BI-THF and THFI components decrease to 2% and 3%, respectively. This indicates that most of W-CLR is converted to oil and asphaltene, and a considerable amount of organic matters in IHFI component can be soluble. 6 refs., 3 figs., 2 tabs.

22671 (CONF-9207203–, pp. 131-134) **Fluidity of coal liquefaction residue.** Nakagawa, T. (Nippon Steel Corporation, Tokyo (Japan)); Sakawa, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Fluidity of the liquefaction residue is studied to secure stabilized operation of a vacuum distillation tower in the coal liquefaction plant. Viscosity measurements are made on liquefaction residues of Wyoming, Wandoan and Illinois No.6 coals. Viscosity is measured as apparent viscosity using an E-type rotational viscometer. Temperature dependence is noticed in activation energy obtained form Arrhenius plots for viscosity values. Both softening temperature and folded point temperature are determined by the structure of residue. It is judged that the residue of Wyoming coal is a pseudoplastic fluid, and the residues of Wandoan coal and Illinois No.6 coal are a non-Bingham fluid with yield values. The higher the temperature is, the smaller the non-Newtonian index is and the lower the coagulation of residue is. Estimated viscosity of the carbonaceous material becomes higher as the degree of coalification of material coals increases. It is presumed that this relates to elongation of the chain length of the side chain which is a unit structure. 4 refs., 4 figs., 3 tabs.

22672 (CONF-9207203–, pp. 135-138) **Product properties in coal flash pyrolysis.** Sasaki, M. (Nippon Steel Corporation, Tokyo (Japan)); Sakawa, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

A study is made on effects of thermal decomposition conditions of the coal flash pyrolysis and solvent swelling treatment of coal on properties of tar as a product. Coal pulverized below 200 meshes is sent to the reactor previously set at a predetermined temperature and thermally decomposed in an instant. When reaction temperature is low, it is considered that bridge structures linking unit structures of the coal which is relatively small in binding energy are cut and side chains such as methyl group are not cut. Therefore, tar containing side chains can be obtained. When reaction temperature is high, it is considered that bridges and side chains are cut, and since radical concentration of pyrolytic fragments increases, re-binding between pyrolytic fragments is promoted in parallel with stabilization by hydrogen radicals supplied from outside, and relatively high polymer tar is produced. It is found that stabilization of pyrolytic fragments by hydrogen radicals is promoted by flash pyrolysis of coal pretreated in tetralin at 700°C and in 2-second residence time under the hydrogen atmosphere, and the tar obtained is lightened. 1 ref., 6 figs., 1 tab.

22673 (CONF-9207203–, pp. 139-142) **Catalytic hydrocracking reaction of nascent coal volatile matter under high pressure in a two-stage reactor.** Yamashita, H. (Tohoku University, Sendai (Japan). Institute for Chemical Reaction Science); Chareonpanichi, M.; Takeda, T.; Tomita, A. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

This paper studies possibility of controlling distribution of final pyrolysis product by varying atmospheric gas pressure, catalyst, kind of coal, and first- and second-order reaction temperatures in two-stage reaction of the coal flash heating pyrolysis. Five kinds of coal are used, and Co/Mo and Ni/Mo which are pulverized and presulfurized are used as catalyst. The two-stage reactor is used under pressurization by hydrogen or helium. In the first stage, coal is thermally decomposed, heating it up to 400-600°C at a heating velocity of 10°C/s and retaining it for two minutes. The produced primary volatile matter is immediately led to the catalyst bed in the second stage set at 400-700°C and directly reformed. It is found that a substantial increase in yield of useful liquid content is possible by conducting the two-stage reaction using catalyst under hydrogen pressurization. Coal with high H/C values, sulfurized Mo system catalyst and high hydrogen pressure show high effectiveness for increasing BTX yields. Optimized combination of coal pyrolysis in the first stage and secondary reaction in the second stage is important for increasing yields of the useful content. 3 refs., 1 fig., 3 tabs.

22674 (CONF-9207203–, pp. 143-148) **New technology development for realization of the coal gasification combined cycle power generation system.** Hirato, M. (Research Institute of Energy, Tokyo (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The paper proposes that as a noble use of fossil fuels, the use of coal for power generation is most suitable. The coal gasification combined cycle power generation system has been taken notice of in which the coal gasified is supplied to the gas turbine and the exhaust gas generates steam which is sent to the steam turbine. On the assumption that an inlet temperature of the gas turbine is 1300°C, thermal efficiency is 2-4% higher than that of the pulverized coal-fired power generation. Coal gasification by partial oxidation instantly reaches an equilibrium state because of high temperature, and the gas is theoretically composed of two components of CO and H2. In the entrained bed gasifier, optimal gasification temperature is 1250-1300°C at 30 atm. However, since the gasifier is actually operated at a high temperature of 1500°C or more to fuse ash of the coal, it is necessary to lower the melting point of ash by addition of limestone. The possibility of using limestone-added slag as cement is fairly high. CO2 unit requirement and energy conversion efficiency from coal are superior to those in coal boilers and fluidized bed boilers. 10 figs., 2 tabs.

22675 (CONF-9207203–, pp. 155-158) **Development of a new coal hydrogenation process by Osaka Gas and British Gas.** Kobayashi, K. (Osaka Gas Co. Ltd., Osaka (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

This paper reports results of the development of coal hydrogasification process having been promoted jointly by Osaka Gas and British Gas. This is a process in which coal is reacted with hydrogen under the controlled atmosphere of high temperature/pressure utilizing the flash hydropyrolysis to directly obtain methane, BTX, etc. The reactor only conducts preheating of hydrogen necessary for heat balance as an adiabatic reactor by circulating gas inside it, and can keep exothermic reaction of coal and hydrogen. Performance of the new reactor is demonstrated in a 5 ton/day PDU constructed. The PDU can make runs for at most 200kg/h of coal feed, 670Nm^3/h of hydrogen feed, 62 bar of pressure and 1000°C of highest temperature. Coals used are British and American bituminous coals, Australian brown coal, and Taiheiyo coal. Continuous operation for 231 hours is achieved with no troubles such as plugging of the reactor or carbon precipitation. Important engineering information such as continued coal supply and cooling continued taking-out of char is obtained. 1 ref., 4 figs., 2 tabs.

22676 (CONF-9207203–, pp. 159-162) **Effect of melting ash on reactivity of coal char gasification at high temperature.** Lin, S. (Tokyo University of Agriculture and Technology, Tokyo (Japan). Faculty of Engineering); Ninomiya, Y.; Shu, Z.; Hirato, M.; Horio, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The paper studies effects of ash melting states on reactivity and reaction of high temperature gasification from the point of reaction velocity at each gasification conversion ratio when gasifying 4 kinds of coal in a temperature range from 900 to 1500°C. Since, when calculating activation energy from Arrhenius plots of reaction velocity at the conversion ratio of 10%, it is 121 - 230 kJ/mol, reaction is presumed to have advanced in chemical reaction rate controlling. In each kind of coal, reaction velocity in the latter part of the reaction decreases as compared with that in the first part of the reaction, and the temperature where a multiple of the reaction velocity becomes highest exists, which characterizes high temperature gasification (characteristic temperature). The reaction is in chemical reaction controlling around the characteristic temperature, and seems to be in mass transfer rate controlling gradually as the reaction advances. There is a process of ash melting in which ash does not adhere to char → does adhere → does not adhere, with increasing temperature. The ash seems to stick most easily to char around the characteristic temperature. It is considered that char is shut out from reaction gas by the ash which sticked, and reaction activity is losed on the surface of some char. 2 refs., 6 figs., 2 tabs.

22677 (CONF-9207203–, pp. 163-166) **Pore structure of char derived from coal gasification at high temperature.** Zhu, Z. (Tokyo University of Agriculture and Technology, Tokyo (Japan). Faculty of Engineering); Lin, S.; Ninomiya, Y.; Hirato, M.; Horio, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

In this study, several kinds of coal are CO2 gasified in a temperature range of 1273-1773K, and pore distribution of the char reacting at each conversion ratio is measured. An effect of port structure on high temperature gasification is studied by correlations between pore surface area is and reaction velocity. The micropore surface area is obtained from the CO2 adsorption method, and the macropore surface area is obtained from pore distribution measured by pressurizing up to 100MPa by mercury porosimeter. The micro surface area decreases with increasing reaction temperature and with increasing conversion ratio. The higher the temperature is, the smaller the surface area is, and when the temperature is above 1673K, the surface area shows a gradual decline. When the temperature is much higher, the size of pore clearly enlarges with an increase in conversion ratio. Good dependence of reaction velocity on the micropore surface area is recognized, but that on the macropore surface area is not. The effect of micropores on reaction velocity is important also in high temperature gasification. 2 refs., 10 figs., 1 tab.

22678 (CONF-9207203–, pp. 167-170) **Development of a coal gasifier with circulating solid particles as heat medium.** Hatate, Y. (Kagoshima Univ., Kagoshima (Japan). Faculty of Engineering); Uemura, Y.; Usukubo, M.; Tanaka, S.; Miyauchi, M.; Ijichi, K.; Tanaka, Y. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

As a coal gasifier, contrived is an entrained bed coal gasifier with a draft tube, the reactor of which is divided into three zones up to down. By the use of circulating heat storage particles, the gasifier has a feature that the devolatization/differentiation process and the gasification (hydrogen production) process can be done separately inside the one apparatus and has no defects like lowering of reactivity and popping of unreated char caused by reverse mixture. In this report, as the first stage of the study, the experiment is conducted on a one-division system apparatus using cold models and hot models. The hot model designed from the cold model experimental data is composed of an outer cylinder with a minor diameter of the tower body of 156 mm and a draft tube with a minor diameter of 10.9 mm, and the tower is filled with ceramic particles and supplies coal char from the tower top by supplying air from the tower bottom for circulation. From the analytical result of gas formed in catalytic reaction with steam, it is recognized that hydrogen is selectively generated and this gasifier is effective for hydrogen production process. 5 figs., 2 tabs.

From the viewpoint of lengthening the life of coke oven, it is important to elucidate the generation mechanism of dilation pressure during the coal carbonization. In the present report, the influence of carbonizing conditions and physical properties of coal was studied on the gas permeability which is one of the important factors for elucidating the above mechanism and was assumptively calculated from the gas pressure distribution in the softening layer. Both the gas pressure and temperature in the coal layer were experimentally measured under both free and constrained dilations of coke by heightening the temperature of powdery coal sample with which a small diameter bottom-closed tube was filled up. As a result, the gas pressure lowered with enlargement in layer height, which showed an existence of gas flow upwards. A formula to give the pressure distribution in the direction of height was derived from both the gas flow and mass balance. Further, a formula to assumptively calculate the permeability was derived from the pressure distribution. Then, it was made clear that the permeability enlarges with lightening in load to the melting layer, enlargement in specific volume, heightening in heating rate, heightening in inactive content of coal composition and heightening in highest fluidity. 2 refs., 4 figs.

22680 (CONF-9207203–, pp. 173-176) **Investigation of coking pressure during carbonization of coke oven.** Hanaoka, K. (Kawasaki Steel Corp., Tokyo (Japan)); Igawa, I. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The dilation characteristics of coal are important for the strength control of coke during the coal carbonization. The dilation pressure, if exceeding its permissible limit, causes destruction of heating wall, which necessitates the control to be made in an appropriate range. From the viewpoint of stabilizing the operation and lengthening the life of oven body, the present report reported a

preparation of formulation model to assumptively calculate the dilation pressure influential on the oven wall, which preparation was made through a basic experiment on the generation mechanism of dilation pressure. Assuming that the dilation pressure was obtained as a total pressure loss in both the softening/melting layer and coke layer as far as the oven wall, ventilation resistance was measured in each of the layers and change was experimentally obtained in bulk density of powdery coal by the pressurizing force. The dilation pressure which was experimentally obtained with a small 40kg vessel and corrected in frictional force, etc. because of smallness of that used vessel was almost equal to that calculated through the above model, which was therefore proved to be high in accuracy. Further, a compounding guidance for keeping the operation stable was prepared through investigating the influence of both compounding and carbonizing conditions of coal on the dilation pressure with a use of the above model. 4 refs., 12 figs.

22681 (CONF-9207203–, pp. 177-180) **Study of gas flow pattern in commercial coke oven chamber.** Sekine, H. (Nippon Steel Chemical Co. Ltd., Tokyo (Japan)); Maeno, Y.; Edakuni, T.; Aramaki, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

According to the result of discussions on gas flow pattern in a commercial coke oven chamber, using a test furnace as reported in the previous reports, it was known that the flows move toward the furnace length direction on the coal layer side, and toward the furnace height direction in the coke layer/furnace wall clearance. This paper reports an investigative experiment to verify the flow pattern in an actual furnace (with a charge capacity of 25 t/d to 27 t/d). First, the steam concentrations were compared between that in the vicinity of the furnace lid on the furnace top space and that at other positions. The steam concentration distribution showed a high concentration in the vicinity of the furnace lid. According to the result of calculating thereof, the internal gas leak factor has reached 90% to 95%, signifying that most part of the steam and gases generated in the coal layer is discharged outside the furnace before it reaches the furnace lid. Also from an experiment with tracers (N2 and Ar) charged into coal layers, it has been made clear that the softening zone is not a full non-permeable layer in the actual furnace, but the gases in the coal layers have a high ratio of being discharged outside directly. 2 refs., 5 figs., 4 tabs.

22682 (CONF-9207203–, pp. 181-185) **On-line supervision system for benzol recovery plant.** Ishiguro, H. (NKK Corp., Tokyo (Japan)); Matsumura, S.; Oshima, Y.; Tahara, T.; Kawashima, A.; Sato, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

This paper summarizes a diagnosis and control expert system for a benzol recovery plant operation among other operation aiding systems used at the K Chemical's plant. The equipment recovers benzene, toluene and xylene (BTX) contained in gases generated from a coke furnace, and consists of two systems; a numerical model system to achieve an optimal operating condition and an anomaly diagnostic system used concentratedly on the operating techniques. The anomaly diagnostic system monitors 131 parameters indicating the plant conditions on a real-time basis, detects an anomaly if any occurs, and guides an operator to inferring and correcting causes of the anomaly. While anomalies include those from operation and devices, the system advises inferred causes and restoration measures if, for example, a condition deviates largely from the normal operating condition. The system is edited with 34 items of information on operation anomaly diagnoses and 300 rules. 5 refs., 5 figs., 1 tab.

22683 (CONF-9207203–, pp. 190-192) **Reoperation results of the formed coke pilot plant.** Oshima, H. (Kawasaki Steel Corp., Tokyo (Japan)); Furuta, K.; Nakagawa, Y.; Kakumaru, T.; Komaki, I. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

A formed coke pilot plant has been developed during a period between 1979 and 1986 under a joint research by the Continuously Formed Coke Research and Development Committee in the Steel and Iron Federation of Japan. The plant has been kept dormant for four years to date. This paper reports the pilot plant recently reoperated from a necessity of its testing for a blast furnace use, with regard to the result of its preparation, construction, operation and restopping. To make the plant capable of being used stably for one year as a criterion, the construction included overhauling valves and blowers; replacing parts in electric instrumentation; spray-cleaning joints in the carbonizing furnace; reapplying dome casters on the high-temperature heating furnace; renewing the front of the low-temperature heating furnace; and cleaning other parts. The operation has continued from the first to the third operation phase on a 4-worker × 4-shift basis for 239 days with a total production of 42,835 tons (dry). The coke quality was found as good as DI at 84.6 and CSR at 56.5, which is nearly equivalent to that obtained under the joint research first written. 3 figs., 1 tab.

22684 (CONF-9207203–, pp. 193-196) **Preheating of coal for continuous coke making process.** Nagumo, A. (Seikei Univ., Tokyo (Japan). Faculty of Engineering); Matsukata, M.; Kojima, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

With an aim to realize a three-stage coke lump manufacturing process with rapid heating/agglomeration/uniform low-temperature heating up to just before softening and melting of coal, this paper describes a basic study on its first stage. Shortening carbonizing time, expanding selection scope of raw materials, and improving their quality may be expected by rapidly heating coal up to just before its softening point (about 400°C). With an objective to decide the maximum temperature in the rapid heating and identify relations among solidification characteristics and various conditions, experiments were carried out using a fluidized bed (nitrogen flowing) reactor (batch type) with an inner diameter of 40 mm charged with different types of coal. The following results were obtained: the inter-layer temperature under normal fluidization is uniform; on the other hand, a temperature when the temperature distribution changed rapidly was determined as the solidification temperature; and it was found that in a coal type with larger maximum fluidizing degree the heating was faster, and the larger the fluidizing gas flow rate is, the higher the solidification temperature rises thus the maximum heating temperatures were determined by coal type. 4 figs., 2 tabs.

22685 (CONF-9207203–, pp. 197-200) **Operation of the coal moisture control plant at Kashima No.2 coke battery.** Nishiyama, Y. (Sumitomo Metal Industries Ltd., Osaka (Japan)); Yoda, K.; Yoshida, S.; Yagyu, K.; Kodama, T.; Yabuuchi, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

This paper reports operation of the coal moisture control plant at Kashima No. 2 coke battery installed with aims to save energy, improve coke productivity and quality, and stabilize the operation, as well as results of comparing it with conventional moisture control methods. The plant is of a steam tube dryer type (with tubes with a diameter of 3.8 m and a length of 25 m) having a capacity to treat wet steam at 330 t/h and capable of reducing moisture from 10.5% to 6.5%. The system is of completely automatic control. The plant has been operated on a continuous basis since February 1992 without a big trouble controlling moisture at an accuracy of ± 0.2%

to the value. The effect of reducing the quantity of heat for carbonization remains at about -50 Mcal/t currently because of low load operation. The plant is operating with somewhat less steam consumption than the design value. Raised bulk densities assure approximately the same coal charging amount as the conventional methods. No noticeable aggravation has been recognized in coke quality. 8 figs., 1 tab.

22686 (CONF-9207203–, pp. 149-154) **Future prospect of coal hydrogasification techniques.** Kaiho, M. (National Institute for Resources and Environment, Tsukuba (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Hydrogasification technology is outlined as a technology to convert coal which is richer in reserve than petroleum or natural gas to SNG (synthesis gas). This is a technology in which coal is reacted on hydrogen above 800-950°C under the controlled atmosphere more than 30 atm to produce gases mostly including methane. Light distillate as by-product is composed mainly of BTX. It has no tar trouble which becomes the problem in the conventional gasification, and is easily usable. The reaction mechanism has not been elucidated in detail. For SNG production, there are a partial oxidation-methane synthesis method and a hydrogasification method. Both are partial oxidation reaction by oxygen. When considering the global warming, carbon conversion ratio $\simeq 1$ is a requisite condition. Therefore, both methods have no ways to increase efficiency but reduction in oxygen ratio. The entrained bed gasifier method using pulverized coal is desirable for a hydrogasifier. The entrained bed gasifier is desirable also for a hydrogen production furnace. It is necessary to optimize material balance and to enhance efficiency at a stage of producing hydrogen. 3 figs., 2 tabs.

22687 (CONF-9207203–, pp. 201-204) **Hot repair technique of oven wall.** Tsugita, Y. (Nippon Steel Corp., Tokyo (Japan)); Kikuchi, A.; Sumita, Y.; Okanishi, K.; Otsuka, J.; Oda, Y.; Kudo, T.; Shigemi, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Subsequent to the existing techniques for hot repair of furnace edges in repairing degraded walls in a coke furnace, a boring process was developed that replaces only the central part with new bricks. The coke furnace subjected to the repair was a Nittetsu composite furnace with 75 chambers, with the central parts in No.67 and No.68 flue arrays warped with swelling of 67 mm at maximum. The repair was decided to be applied to 9 to 22 flues horizontally and 36 to 64 steps vertically. The construction has been carried out from October 20, 1991 through December 3, 1991 with a sequence of reinforcing the insertion vehicle rails → cooling, inserting heat insulating boxes → dismantling bricks, processing → stacking bricks → heating bricks → preparing brick insertion, spraying → initial insertion, and dry sealing. After the temperature was raised, bricks were given an edge preparation and the edges were sprayed to improve airtightness between the new and old bricks. The furnace temperature and furnace expanding behavior were controlled during these processes. The furnace was restored to a normal operation. 5 figs., 2 tabs.

22688 (CONF-9207203–, pp. 205-208) **Influence of coke oven width on coking time.** Suzuki, N. (NKK Corp., Tokyo (Japan)); Itagaki, S.; Fukada, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

There are a large number of reports that in a horizontal chamber type coke furnace the minimum coking time (t) is determined mainly from the furnace width (x_C) , and with $t = kx_C^n$ (k and n are constants), the n ranges from 1.2 to 2. The n closer to 1 reduces a need of increasing the number of furnace gates even if the furnace width is increased, which draws much attention because of the recent trend of increasing furnace sizes. This paper discusses this relationship using calculations with a furnace heat transfer simulation model and a coking test using a small electric oven. The simulation result showed how the n increases when the brick temperature was raised, the furnace width was increased, and the brick thickness was reduced. For example, the n was 1.4 when the temperature was 1200°C, the width was from 400 mm to 600 mm, and the thickness was 100 mm. The facts that the n for the coke furnace is smaller than 2 for flat plate heating and that the value changes depending on conditions were explained from the temperature dependence of the thermal properties. 8 refs., 9 figs.

22689 (CONF-9207203–, pp. 227-230) **Studies on cobalt catalyst for fischer-tropsch synthesis.: Effect of surface acidity and pore structure of SiO2-Al2O3 supports on the composition of their products.** Mori, K. (Kansai University, Osaka (Japan). Faculty of Engineering); Terada, T.; Oda, H.; Yokokawa, C. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Product distribution in the Fisher-Tropsch synthetic reaction has a Schultz-Flory type carbon distribution, which makes synthesizing certain objects selectively difficult. Discussions have been given recently on catalysts and reactive conditions to attempt controlling this characteristic. This paper discusses effects of surface acidity and pore structure of SiO2, SiO2 -Al2O3 supports on the composition of their products under different conditions. As a result of experiments using a fixed bed flow reactor, the following findings were obtained for example: SiO2 as an F-T synthetic catalyst had higher conversion rate than Al2O3 ; SiO2 and Al2O3 supports having pores from 30Å to 70Å suppressed methanization and accelerated producing hydrocarbon of higher than C11 ; and presence of surface acidic groups in the SiO2-Al2O3 support exhibited effect of producing iso-structures. 4 refs., 1 fig., 3 tabs.

22690 (CONF-9207203–, pp. 237-240) **Hydrodenitrogenation of coal liquids by phenol addition.** Mashimo, K. (Nihon University, Tokyo (Japan). College of Science and Technology); Sugano, M.; Fujimoto, Y.; Wainai, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

It is expected that denitrogenation effect will be elevated in hydrodenitrogenation process of coal liquids by means of adding phenol, which is difficult to get decomposed in acidic compounds, to raise acidity of catalysts. Accordingly, a secondary hydrogenation reaction was carried out on acidic, neutral, and basic fractions in primary coal liquids to investigate phenol addition effect. Test samples are the separated fractions of acidic oil and basic oil separated from Akabira primary coal liquid or Miike primary coal liquid using solvents or ion exchange resins. The secondary hydrogenation reaction was performed in an autoclave under an Mo-based catalyst added with 0% to 10% phenol. Addition of phenol accelerated denitrogenation of oil and asphaltene components, which was found attributable to denitrogenation of the contained acidic oil, and effective especially for denitrogenating strong acidic oil containing less hydroxyl groups. No addition effect was discovered in basic oil containing preasphaltene at 53%. 2 refs., 3 figs., 1 tab.

22691 (CONF-9207203–, pp. 265-268) **Conversion of aqueous ethanol to olly products and combustion of coke produced, on Pt-TiO2/SiO2.** Nakano, K. (Fukuoka Univ., Fukuoka (Japan)); Shiraishi, Y.; Yamaguchi, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

A Pt-TiO2/SiO2 catalyst was prepared and studied for the purpose of realizing a catalyst which allows ethanol manufactured biotechnologically as a new energy source to be fired completely as fuel in the form of aqueous solution without producing aldehyde etc. It consists of alumina or silica carrier coated with a thin titania layer on which a trace amount of platinum is sustained. An ethanol aq. solution of 0.5 mole fraction was fed through a carburettor at 1.03/h WHSV into a reactor packed with 20g of this catalyst and fired at the reaction temperature of 300°C to obtain highly efficient combustion compared with Pt-SiO2, or Pt-Al2O3. In this case, oily material such as heptene was separated in addition to methane, hydrogen and oxygen. It is a substance peculiar to titania and considered to be produced successively through disintegrated products of alcohol and water and in competetion with coke. 4 figs.

22692 (CONF-930802–1) **Mechanism of HDS/HDN reactions.** Mullins, D.R.; Lyman, P.F. Oak Ridge National Lab., TN (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 206. American Chemical Society national meeting; Chicago, IL (United States); 22-27 Aug 1993. Order Number DE93011858. Source: OSTI; NTIS; GPO Dep.

One method for exploring the mechanisms involved in HDS/HDN reactions is to study the elementary reaction steps that occur for model systems using UHV surface science techniques. Our approach has been to examine reactions involving a prototypical organosulfur molecule, methanethiol, adsorbed on different clean and modified metal surfaces. In general, as the surface is heated, this molecule follows two principle reaction pathways on most transition metal surfaces. At low coverages, the molecule undergoes total decomposition producing adsorbed atomic sulfur and carbon and gaseous H_2. At higher coverages a competing pathway results in adsorbed sulfur and gaseous methane. In order to understand these reactions, the different chemical intermediates are identified, and the differences in reactivity for these intermediates are studied as a function of adsorbate coverage, surface composition and sample temperature. Several analytical techniques are employed in these experiments. Temperature programmed desorption, TPD, is used to identify the desorbed reaction products, their desorption temperature and the branching ratio as the system is modified. Auger electron spectroscopy, AES, is used to determine the amount of adsorbed atomic species that result from the reaction. The reaction intermediates are studied by high resolution soft x-ray photoelectron spectroscopy.

22693 (DOE/FTR–93012115) **Travel to Alberta, Canada to discuss the research on Advanced direct coal liquefaction concepts: Foreign trip report, October 18–21, 1992.** Kornfeld, S.C. USDOE Pittsburgh Energy Technology Center, PA (United States). 24 Nov 1992. 6p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012115. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of the trip was to discuss the contract titled "Advanced Direct Coal Liquefaction Concepts" and to tour the Alberta Research Council's Devon and Nisku facilities, which are both located near Edmonton. The contract, DE-AC22-92PC91050, was awarded on July 30, 1992 jointly to the Canadian Energy Development, Inc., and the Alberta Research Council (CED/ARC). This new 24 month contract, with a total cost of $1,686,762, is 30 percent cost shared by CED/ARC. The objective of this research is to develop a new approach to liquefaction that generates an all distillate product slate at reduced cost. Highlights are: (1) Autoclave tests are investigating the stability of the coal derived solvent, which will be used in the direct liquefaction program. (2) A laboratory scale demonstration of agglomeration was performed during the tour at Devon. The test showed that loose agglomerates were easily produced from the Wyoming Black Thunder coal, using the coal derived solvent obtained from Wilsonville operations. (3) Visited the five ton/day coal agglomeration facility at Devon. It was used for development of ARC's patented AGLOFLOAT technology. ARC participated in the design of the agglomeration facility at Wilsonville, Alabama, which PETC supported to demonstrate related technology.

22694 (DOE/MC/24116–3363) **Development of an advanced, continuous mild gasification process for the production of co-products: Quarterly report, October 1, 1992–December 31, 1992.** O'Neal, G.W. Coal Technology Corp., Bristol, VA (United States). 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC24116. Order Number DE93013989. Source: OSTI; NTIS; GPO Dep.

A 70-pound continuous coke sample was prepared for testing by a major conventional coke producer. Test results were encouraging, but a suggestion was made to produce larger briquettes. Work is underway to produce 6in. x 5in. x 3.75in. briquettes with plans to crush these briquettes to plus 2-inch x minus 3-inch irregular shaped coke. Work continued to provide a coke reactivity test instrument at CTC. A new vessel was fabricated of Haynes HR-160 which will withstand temperatures up to 2300°F. A total of 11 CMGU test runs were completed. Coal feed rates of over 1000 pounds per hour for short periods were obtained. Average feed rates of over 800 pounds per hour were reached for two test runs. The jet burners heating the insides of the screws' shafts made these higher rates possible. Three test runs were made using 28 x 100 mesh Penelec filter cake with the objective of upgrading this coal processing byproduct to coke. Improvements to the PDU continued with two condensers' modifications and improved packing gland seals.

22695 (DOE/MC/24267–3327) **Addendum to industrial market assessment of the products of mild gasification.** North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center; Sinor (J.E.) Consultants, Inc., Niwot, CO (United States). May 1992. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC24267. Order Number DE93000264. Source: OSTI; NTIS; GPO Dep.

The objective of this report is to review and update the 1988 report by J. E. Sinor Consultants Inc., "Industrial Market Assessment of the Products of Mild Gasification, and to more fully present market opportunities for two char-based products from the mild gasification process (MGP): Formcoke for the iron and steel industry, and activated carbon for wastewater cleanup and flue gas scrubbing. Please refer to the original report for additional details. In the past, coal conversion projects have and liquids produced, and the value of the residual char was limited to its fuel value. Some projects had limited success until gas and oil competition overwhelmed them. The strategy adopted for this assessment is to seek first a premium value for the char in a market that has advantages over gas and oil, and then to find the highest values possible for gases, liquids, and tars, either on-site or sold into existing markets. During the intervening years since the 1988 report, there have been many changes in the national economy, industrial production, international competition, and environmental regulations. The Clean Air Act Amendments of 1990 (CAAA) will have a large impact on industry. There is considerable uncertainty about how the Act will be implemented, but it specifically addresses coke-oven batteries. This may encourage industry to consider formcoke produced via mild gasification as a low-pollution substitute for conventional coke. The chemistry and technology of coke making steel were reviewed in the 1988 market assessment and will not be repeated here. The CAAA require additional pollution control measures for most industrial facilities, but this creates new opportunities for the mild gasification process.

22696 (DOE/MC/24267–3329) **Development of an advanced, continuous mild gasification process for the production of co-products: Task 4.6, Economic evaluation.** Cohen, L.R. (Xytel-Bechtel, Inc. (United States)); Hogsett, R.F.; Sinor, J.E.; Ness, R.O. Jr.; Runge, B.D. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Oct 1992. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC24267. Order Number DE93000266. Source: OSTI; NTIS; GPO Dep.

The principal finding of this study was the high capital cost and poor financial performance predicted for the size and configuration of the plant design presented. The XBi financial assessment gave a disappointingly low base-case discounted cash flow rate of return (DCFRR) of only 8.1% based on a unit capital cost of $900 per ton year (tpy) for their 129,000 tpy design. This plant cost is in reasonable agreement with the preliminary estimates developed by J.E.

Sinor Associates for a 117,000 tpy plant based on the FMC process with similar auxiliaries (Sinor, 1989), for which a unit capital costs of $938 tpy was predicted for a design that included char beneficiation and coal liquids upgrading–or about $779 tpy without the liquid upgrading facilities. The XBi assessment points out that a unit plant cost of $900 tpy is about three times the cost for a conventional coke oven, and therefore, outside the competitive range for commercialization. Modifications to improve process economics could involve increasing plant size, expanding the product slate that XBi has restricted to form coke and electricity, and simplifying the plant flow sheet by eliminating marginally effective cleaning steps and changing other key design parameters. Improving the financial performance of the proposed formed coke design to the level of a 20% DCFRR based on increased plant size alone would require a twenty-fold increase to a coal input of 20,000 tpd and a coke production of about 2.6 minion tpy–a scaling exponent of 0.70 to correct plant cost in relation to plant size.

22697 (DOE/MC/25141–3339) **High-pressure coal fuel processor development: Task 1, Proof of principle testing.** Greenhalgh, M.L. Caterpillar, Inc., Peoria, IL (United States). Nov 1992. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC25141. Order Number DE93000276. Source: OSTI; NTIS; GPO Dep.

The objective of Subtask 1.1 Engine Feasibility was to conduct research needed to establish the technical feasibility of ignition and stable combustion of directly injected, 3,000 psi, low-Btu gas with glow plug ignition assist at diesel engine compression ratios. This objective was accomplished by designing, fabricating, testing and analyzing the combustion performance of synthesized low-Btu coal gas in a single-cylinder test engine combustion rig located at the Caterpillar Technical Center engine lab in Mossville, Illinois. The objective of Subtask 1.2 Fuel Processor Feasibility was to conduct research needed to establish the technical feasibility of air-blown, fixed-bed, high-pressure coal fuel processing at up to 3,000 psi operating pressure, incorporating in-bed sulfur and particulate capture. This objective was accomplished by designing, fabricating, testing and analyzing the performance of bench-scale processors located at Coal Technology Corporation (subcontractor) facilities in Bristol, Virginia. These two subtasks were carried out at widely separated locations and will be discussed in separate sections of this report. They were, however, independent in that the composition of the synthetic coal gas used to fuel the combustion rig was adjusted to reflect the range of exit gas compositions being produced on the fuel processor rig. Two major conclusions resulted from this task. First, direct injected, ignition assisted Diesel cycle engine combustion systems can be suitably modified to efficiently utilize these low-Btu gas fuels. Second, high pressure gasification of selected run-of-the-mine coals in batch-loaded fuel processors is feasible. These two findings, taken together, significantly reduce the perceived technical risks associated with the further development of the proposed coal gas fueled Diesel cycle power plant concept.

22698 (DOE/MC/25141–3340) **High-pressure coal fuel processor development: Final report.** Greenhalgh, M.L. (Caterpillar, Inc., Peoria, IL (United States)). USDOE Morgantown Energy Technology Center, WV (United States); Caterpillar, Inc., Peoria, IL (United States). Dec 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC25141. Order Number DE93000277. Source: OSTI; NTIS; GPO Dep.

Caterpillar shares DOE/METC interest in demonstrating the technology required to displace petroleum-based engine fuels with various forms of low cost coal. Current DOE/METC programs on mild gasification and coal-water-slurries are addressing two approaches to this end. Engine and fuel processor system concept studies by Caterpillar have identified a third, potentially promising, option. This option includes high-pressure fuel processing of run-of-the-mine coal and direct injection of the resulting low-Btu gas stream into an ignition assisted, high compression ratio diesel engine. The compactness and predicted efficiency of the system make it suitable for application to line-haul railroad locomotives. Two overall conclusions resulted from Task 1. First direct injected, ignition assisted Diesel cycle engine combustion systems can be suitably modified to efficiently utilize low-Btu gas fuels. Second, high pressure gasification of selected run-of-the-mine coals in batch-loaded fuel processors is feasible. These two findings, taken together, significantly reduce the perceived technical risk associated with the further development of the proposed coal gas fueled Diesel cycle power plant concept. The significant conclusions from Task 2 were: An engine concept, derived from a Caterpillar 3600 series engine, and a fuel processor concept, based on scaling up a removable-canister configuration from the test rig, appear feasible; and although the results of this concept study are encouraging, further, full-scale component research and development are required before attempting a full-scale integrated system demonstration effort.

22699 (DOE/PC/88940–T14) **Fundamental studies in production of C_2-C_4 hydrocarbons from coal: Final report, 1 September 1988–31 August 1992.** Wiser, W.H.; Oblad, A.G. Utah Univ., Salt Lake City, UT (United States). Mar 1993. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-88PC88940. Order Number DE93014936. Source: OSTI; NTIS; GPO Dep.

The following conclusions can be drawn from the result obtained in this kinetic study of single stage coal gasification to hydrocarbon (HC) gases high in C_2-C_4 hydrocarbons. It was observed that the direct conversion of coal to HC gases involves two steps. The first step is thermal cleavage of the coal structure to produce liquids with small amounts of gases and coke. The second step is conversion of liquids to gases. Coal to liquids occurs very rapidly and was completed within 10 minutes. Liquids to gases is the rate-determining step of the overall process. The conversion of liquids to gases was observed to follow first order kinetics. The first order kinetics treatment of the data by isothermal approximation gave an apparent activation energy of approximately 23 kcal/mol. The first order kinetics treatment of the data by a more rigorous non-isothermal method gave an activation energy of 26 kcal/mol. The quantity of HC gases produced directly from coal reached a constant value of about l0% of the dmmf coal at a reaction time of 10 miutes. Most of the HC gases were produced from the liquids. The study of model compounds shows that conversion of liquids to HC gases.proceeds through a carbonium ion mechanism, and this accounts for the production of C_2-C_4 gases. Liquid to gases occurs by a catalytic hydrocracking reaction.

22700 (DOE/PC/89781–12) **A novel coal feeder for production of low sulfur fuel: Annual technical progress report, October 1, 1991–October 1, 1992.** Khang, S.J.; Keener, T.C.; Line, L. Cincinnati Univ., OH (United States). Coll. of Engineering. [1992]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89781. Order Number DE93014978. Source: OSTI; NTIS; GPO Dep.

The following tasks have been performed (1) Change of the single-ended driving mechanism of the inner screw shaft to a double-ended driving mechanism, (2) Study of the total sulfur balance on the feeder reactor system, (3) Analytical measurements of the organic sulfur contents in the feed coal and the product char, (4) Study of the organic sulfur removal efficiency in the feeder reactor, (5) Designing and setting up a combustor which is physically attached to the feeder system, (6) Study of the combustion characteristics of char and volatiles produced from the pyrolysis process in the feeder system, and (7) Modeling the pyrolysis process in the inner screw tube to estimate the heat transfer coefficient. Some preliminary conclusions have been obtained: (1) Double-ended driving mechanism of the inner screw feeder is useful for a uniform stress on the shaft and to raise the reaction temperature without an additional metal torque on the shaft. (2) The total sulfur balance shows that the sulfur removal efficiency of CaO in this reactor is higher than 90%. (3) The organic sulfur in Ohio #8 coal is 1.72% which amounts to 45.4% of the total sulfur content. (4) A 73.1% of the organic sulfur is removed in the dual-screw feeder reactor at a temperature of 475°C with the residence time of 6 min., (5) The S_2O emission from the combustor stack reduces as the coal feeder temperature rises, corresponding to the level of H S release from the dual-screw feeder. (6) The total heating value of the coal does not significantly decrease during the pyrolysis and desulfurization processes in the coal feeder. The decrease is mainly due to the

loss of sulfur from coal. (7) The heat transfer step is the main resistance to the pyrolysis process in this system. The heat transfer coefficient is estimated to be about 331.7 W/m-K.

22701 (DOE/PC/89781–13) **A novel coal feeder for production of low sulfur fuel: Quarterly technical progress report, October 1, 1992–January 1, 1993.** Khang, S.J.; Keener, T.C.; Lin, L. Cincinnati Univ., OH (United States). Coll. of Engineering. [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89781. Order Number DE93014973. Source: OSTI; NTIS; GPO Dep.

A dual-screw feeder was designed and constructed for desulfurization of coal. The feeder consists mainly of two concentric screw tubes, the inner tube acting as a coal pyrolyzer and the outer tube acting as a desulfurizer with hot calcined lime pellets or other renewable sorbent pellets. Two basic processes are involved in the development of this reactor: the mild pyrolysis of coal and the reaction of H_2S with calcium based sorbent. It combines the coal pyrolysis and the sulfur removal processes in one reactor. The objective of this project is to study the feasibility of an advanced concept of desulfurization inthe coal feeder. In this quarter, the following tasks have been performed: (1) Measurement of volatile yield at different temperature by using TGA, (2) Elemental analysis of the char products from the pyrolysisprocess in the screw feeder, and (3) Improvement of the sampling system of the combustor. The following preliminary conclusions have been confirmed: (1) In the pyrolysis process, the volatile yield of Ohio No. 8 coal significantly increases between 300–500°C. (2) As devolatilization yield increases, desulfurization yield also increases. (3) The denitrification of Ohio No. 8 coal in the dual-screw feeder increases as the temperature and/or residence time increases.

22702 (DOE/PC/89788–T12) **Novel process for depolymerization of coal to C_2-C_4 hydrocarbons: Progress report No. 13, September 1, 1992–November 30, 1992.** Wiser, W.H.; Oblad, A.G. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89788. Order Number DE93014969. Source: OSTI; NTIS; GPO Dep.

Experiments for conversion of coal to light hydrocarbon gases in a single stage have been conducted in a batch reactor. Experiments were performed at five temperatures, ranging from 440 to 500°C. A dual-functional catalyst was used, consisting of sulfided nickel-molybdenum supported on alumina, mixed with silica-alumina cracking catalyst. Representative data from those experiments are presented below. They reveal why it appeared necessary to perform experiments in a two-stage reactor system before an optimum prototype system could be designed. In Figure 1, it is observed that the production of liquids from coal, at all of the temperatures presented, occurs rapidly, reaching maximum values in less than five minutes. By contrast, Figure 2 reveals that production of hydrocarbon (HC) gases proceeds much more slowly, and continues throughout the time period of the experiment (60 minutes). Figure 3, containing data for conversion at 500°C, reveals that the continued production of HC gases is accompanied by a corresponding reduction in liquids, indicating that perhaps most of the HC gases are produced from cracking of the liquids. Figure 4 reveals that, at a temperature of 500°C, most of the HC gases are in fact produced from the liquids.

22703 (DOE/PC/89879–T13) **High temperature ceramic membrane reactors for coal liquid upgrading: Final report, September 21, 1989–November 20, 1992.** Tsotsis, T.T. (University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering); Liu, P.K.T.; Webster, I.A. University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering. 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89879. Order Number DE93014940. Source: OSTI; NTIS; GPO Dep.

Membrane reactors are today finding extensive applications for gas and vapor phase catalytic reactions (see discussion in the introduction and recent reviews by Armor [92], Hsieh [93] and Tsotsis et al. [941]). There have not been any published reports, however, of their use in high pressure and temperature liquid-phase applications. The idea to apply membrane reactor technology to coal liquid upgrading has resulted from a series of experimental investigations by our group of petroleum and coal asphaltene transport through model membranes. Coal liquids contain polycyclic aromatic compounds, which not only present potential difficulties in upgrading, storage and coprocessing, but are also bioactive. Direct coal liquefaction is perceived today as a two-stage process, which involves a first stage of thermal (or catalytic) dissolution of coal, followed by a second stage, in which the resulting products of the first stage are catalytically upgraded. Even in the presence of hydrogen, the oil products of the second stage are thought to equilibrate with the heavier (asphaltenic and preasphaltenic) components found in the feedstream. The possibility exists for this smaller molecular fraction to recondense with the unreacted heavy components and form even heavier undesirable components like char and coke. One way to diminish these regressive reactions is to selectively remove these smaller molecular weight fractions once they are formed and prior to recondensation. This can, at least in principle, be accomplished through the use of high temperature membrane reactors, using ceramic membranes which are permselective for the desired products of the coal liquid upgrading process. An additional incentive to do so is in order to eliminate the further hydrogenation and hydrocracking of liquid products to undesirable light gases.

22704 (DOE/PC/90044–7) **High octane ethers from synthesis gas-derived alcohols: Quarterly technical progress report, April–June 1992.** Klier, K.; Herman, R.G.; Feeley, O.C.; Johansson, M.A. Lehigh Univ., Bethlehem, PA (United States). Jul 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90044. Order Number DE93013524. Source: OSTI; NTIS; GPO Dep.

The objective of the proposed research is to synthesize high octane ethers, primarily methyl isobutyl ether (MIBE) and methyl tertiary butyl ether (MTBE), directly from $H_2/CO/CO_2$ coal-derived synthesis gas via alcohol mixtures that are rich in methanol and 2-methyl-l-propanol (isobutanol). The overall scheme involves gasification of coal, purification and shifting of the synthesis gas, higher alcohol synthesis, and direct synthesis of ethers. The last stage of the synthesis involves direct coupling of synthesis gas-derived methanol and isobutanol that has been demonstrated by us to occur over superacid catalysts to yield methyl isobutyl ether (MIBE) at moderate pressures and a mixture of methanol and isobutene at low pressures. MIBE is an isomer of MTBE and a process is proposed whereby MTBE from the two alcohols is maximized and MIBE is minimized. This will be achieved by the proper choice of reaction conditions, i.e. intermediate pressures, and of inorganic acid catalysts that are stable at temperatures higher than 200°C, at which the carbonium ion reaction coupling of the two alcohols to MTBE is more effective than the oxonium ion or ester reaction coupling to MIBE. Both organic and inorganic catalysts will be investigated, and the better catalysts of these classes will be subjected to long term performance studies. The long term performance studies of the combined process will extend to 1000 hr and detailed analytical data for all products will be provided.

22705 (DOE/PC/90537–T2) **Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 2, January 1–March 31, 1987.** Shabtai, J.S.; Wiser, W.H. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Apr 1987. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015629. Source: OSTI; NTIS; GPO Dep.

One of the main objectives of this project is to investigate the low temperature ($\leq$ 290°C) depolymerization-liquefaction reactions of representative US coals using a 3-step procedure recently developed in our Laboratory. The procedure involves subjecting the coal first to two consecutive depolymerization steps in which different types of intercluster linkages are subjected to preferential cleavage. The depolymerized products obtained have low molecular weights and consist predominantly of monocluster compounds. In the third step of the procedure these simplified depolymerization products are subjected to hydroprocessing and attendant exhaustive hydrodeoxygenation to yield light liquid hydrocarbon mixtures as main products. It is planned under the research program to adapt and optimize the above indicated procedure for US coals of different rank, and to examine the feasibility of the new processing concept for conversion of these coals into light liquid hydrocarbon fuels. A

second major objective of the research program is to subject the lowtemperature depolymerization products (obtained by the first two consecutive steps) to exhaustive structural analysis for the purpose of deriving average structural models for the coals under investigation. Such models are expected to be useful as fingerprints for identification and differentiation of various representative US coals.

22706 (DOE/PC/90537–T3) **Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 3, April 1–June 30, 1987.** Shabtai, J.S.; Wiser, W.H. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Jul 1987. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015628. Source: OSTI; NTIS; GPO Dep.

The Elkhorn (Kentucky) coal sample, referred below as EH(KY) coal, had the following ultimate analysis (MAF basis), in wt %: C, 85–36; H, 5.69; N, 1.75; Cl, 0.18; S, 0.72; 0 (diff) 6.30. H/C atomic ratio - 0.80; ash content (dry basis), 6.60 %. The sample showed a calorific value of 14,324 BTU/ib (dry basis). As indicated by its ultimate analysis and calorific value, the EH(Ky) coal was of somewhat higher rank as compared with the previously studied HVB coal sample from Burning Star (Illinois no. 6). The EH (Ky) coal was subjected to the previously developed stepwise depolyermization-liquefaction procedure summarized in Figure 1 [for details see J. Shabtai, T. Skulthai and I. Saito, Am. Chem. Soc. Div. Fuel Chem. Prepr., 31 (4), 15–23 (1986)]. The procedure consists essentially of the following sequential steps: (1) Intercalation of the coal sample with catalytic amounts (5–20 %) of $FeCl_3$, followed by mild hydrotreatment (HT) of the coal-$FeCl_3$ intercalate; (2) base-catalyzed depolymerization (BCD) of the product from step 1, under super-critical conditions; and (3) hydroprocessing (HPR) of the depolymerized product from the two preceding steps, using a sulfided 6Co8Mo catalyst. A systematic study was carried out with the purpose of determining the optimal range of processign conditions for EH (Ky) coal in each step of the above sequential procedure.

22707 (DOE/PC/90537–T4) **Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 4, July 1–September 30, 1987.** Shabtai, J.S.; Wiser, W.H. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Oct 1987. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015627. Source: OSTI; NTIS; GPO Dep.

The application of the method to the oil fraction of a product obtained from BS(IL) coal by sequential HT-BCD (see Progress Report no. (1)) is given in Figure 8 (A and B). The latter summarize the structural parameters derived for the oil fraction of the depolymerized BS(IL) coal product obtained by HT at 290°C followed by BCD at 290°C. The data derived on the basis of the analytical results show an average molecular formula $C_{22.6}H_{29.1}O_{3.0}N_{0.24}$ for this fraction. The total amount of rings is 3.9, out of which 1.9 are aromatic and 2.0 are naphthenic. The degree of polymerization is 2.3, which means that the above rings are part of a bicluster naphthenoaromatic system. The derived average structure contains 3 oxygen atoms per molecule. In actual molecules composing the oil fraction, these oxygen atoms could be in the form of phenolic, carboxylic, and etheric groups, as indicated by the FTIR spectrum. Figures 8A and 8B indicate two alternative average molecular structures derived for the oil fraction. Structure A consists of two clusters linked by means of a direct (Ar)C-C(Ar) bond, whereas structure B consists of two clusters linked by means of a furanic ring. Both types of linkages have been indicated as very resistant to cleavage under the conditions of the HT and BCD steps. These types of linkages, however, are easily cleaved in the final hydroprocessing step (HPR) of the procedure.

Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Mar 1988. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015626. Source: OSTI; NTIS; GPO Dep.

A Beulah-Zap (North Dakota) lignite sample, designated below as BZ(ND) lignite, was obtained from the Argonne National Laboratory premium coal program. This lignite had the following ultimate analysis (MAF basis) in wt.%: C, 71.05; H, 5.58; N, 1.17; S, 1.60; 0 (diff), 20.6. The ash content (dry basis) was 6.0 wt.%. As expected, the BZ(ND) lignite had a considerably higher oxygen content (~20.6%) in comparison with that of previously studied coals (Progress Reports nos. 1–4). The BZ(ND) lignite was subjected to a previously developed stepwise depolymerization-liquefaction procedure [for details and recent applications see J. Shabtai and T. Skulthai, Proc. 1987 Internat. Confer. Coal Science, Elsevier, Amsterdam (J.A. Moulijn, K.A. Nater, and H.A.G. Chermin, Eds.), 1987, pp. 761764; and J. Shabtai, T. Skulthai, and I. Saito, Am. Chem. Soc. Div. Fuel Chem. Prepr., 31 (4), 15–23 (1986)]. The procedure, as summarized in Figure 1, consists essentially of the following sequential steps: (1) intercalation of the coal sample with catalytic amounts (5–20 %) of $FeCl_3$ followed by mild hydrotreatment (HT) of the coal-$FeCl_3$ intercalate; (2) base-catalyzed depolymerization (BCD) of the product from step 1, under super-critical conditions; and (3) hydroprocessing (HPR) of the depolymerized product from the two preceding steps, using a sulfided 6Co8Mo catalyst. The results obtained in processing the BZ(ND) lignite according to the above procedure are described.

22709 (DOE/PC/90537–T6) **Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 6, January 1–March 31, 1988.** Shabtai, J.S.; Wiser, W.H. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Jun 1988. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015625. Source: OSTI; NTIS; GPO Dep.

Earlier results on the reactions of a Pittsburgh #8 (PA) coal sample, designated below as PB(PA) coal, were described in Progress Report no. 4. Additional work on this coal was performed during the reporting period, as follows: The study of the effect of $FeCl_3$ catalyst concentration upon the efficiency of the HT depolymerization step was extended. Low $FeCl_3$ concentrations, in particular in the range of 3.0 to 7.5 wt%, were investigated at four different HT temperatures (275, 290, 300, and 310°C). It was found that even at the lowest concentration employed (3.0 wt%) $FeCl_3$ is efficient at 290–310°C in causing extensive depolymerization (viz. cleavage of alkylene, e.g., methylene linkages) in the PB(PA) coal framework, as reflected by partial solubilization in THF (7–11 wt%) and attendant high degree of activation of the coal for the subsequent BCD step. Additional BCD experiments with the mildly hydrotreated PB(PA) coal, i.e. , with the partially depolymerized coal product from the HT step, were also performed. In particular, the effect of increased BCD temperature, above 290°C, upon product composition was determined. It was found (see Figure 1) that increase in BCD temperature from 290° to 310°C results in a slight increase in the overall yield of THF solubles. On the other hand, this temperature increase causes a major decrease in the yield of the desirable cyclohexane-soluble (oil) fraction and a corresponding increase in the yield of asphaltol and asphaltene products. This clearly indicates that BCD temperatures above 290°C cause undesirable changes in the composition of the final depolymerized product from PB(PA) coal.

22710 (DOE/PC/90537–T7) **Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 7, April 1–June 30, 1988.** Shabtai, J.S.; Wiser, W.H. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Nov 1988. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015624. Source: OSTI; NTIS; GPO Dep.

Suitable conditions for high-yield conversion of a Pittsburgh #8 (Pennsylvania) coal sample, supplied by the Argonne program and designated below as PB(PA) coal, were previously developed (see Progress Report no. 4, pp. 3–15; and Progress Report no. 6, pp. 3–4). In some recent experiments, the yield of low-boiling hydrocarbon fuel fractions (gasoline, kerosene and gas oil; b.p. up to 325°C) from this coal was further increased to a level of 70–72 wt % (MAF basis). The main emphasis of the research work during the reporting period was on the structural analysis of the depolymerized PB(PA) coal, with the uftimate objective of developing an average molecular structure for the predominant (71.5 – 76.0 wt %) oil fraction (fr. no. 6, Figure 1) as well as for the small asphattene and asphaftol fractions (fr. no. 7 and 8, Figure 1) of this

depolymerized product. The oil and asphaltene fractions of the depolymerized PB(PA) coal (Figure 1, fractions #6 and 7, respectively) were analyzed by gas chromatography/mass spectrometry (GC/MS). Figure 2 shows the reconstructed ion chromatogram for the oil fraction of the depolymerized PB(PA) coal. As seen, the bulk of the compounds present in this fraction elute in the 125–225°C range as an incompletely resolved hump. It is indicated that the oil contains a wide range of compound types.

22711 (DOE/PC/90537–T8) **Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 8, July 1–September 30, 1988.** Shabtai, J.S.; Wiser, W.H. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Mar 1989. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015623. Source: OSTI; NTIS; GPO Dep.

The quantitative ^{13}C NMR, PMR, GC/MS, and FTIR data, as well as elemental composition data for the depolymerized products obtained from Beulah Zap and Pittsburgh no. 8 coals, (Progress Reports no. 5 and 7; and present report) were input into a structural analysis computer program, based on a modified Brown-Ladner method, to derive average structural parameters and, thereby, average molecular structures for the above-mentioned depolymerized coal products. The emphasis was on the structural analysis of the predominant, 65–80 wt%, oil fractions (cyclohexane-solubles) of the depolymerized products. Examples of average molecular structures derived for the oil fractions of depolymerized Pittsburgh no. 8 coal and Beulah Zap lignite are given in Figure 9. These monocluster structures indicate some features which are typical for some of the components comprising the above oil fractions. However, based on (a) the molecular weight distribution of the fractions as determined by mass spectral analysis; and (b) FTIR data indicating the type and relative concentration of oxygen-containing functional groups in the fractions, ft is possible to design molecular structures for probable components in the above two oil fractions, including mostly monocluster (mono-, bi-, and tricyclic) compounds, accompanied by small amounts of bicluster components. Some examples of probable components in the oil fractions of depolymerized Pittsburgh no. 8 coal and Beulah Zap lignite are indicated in Figure 10.

22712 (DOE/PC/91041–T6) **Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, January 1, 1993–March 31, 1993.** Viking Systems International, Inc., Pittsburgh, PA (United States). Apr 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91041. Order Number DE93014515. Source: OSTI; NTIS; GPO Dep.

The near equal conversions were obtained even with high coal/liquid ratio (1/3–1/2) for two-step wise high-temperature soaking and the first stage liquefaction. Expected conversions were not observed when vacuum distillation after soaking was used in stead of cyclohexane extraction. This is presumably due to the difficulty with redispersion of vacuum distillated bottoms in the coal liquid, because a batch wise procedure was taken by using glasswares. It is suggested that the proposed procedure in the previous quarter should be tested by a continuous procedure under enough heating conditions to keep low viscosity of the bottoms.

22713 (DOE/PC/91042–T4) **Effects of low-temperature catalytic pretreatments on coal structure and reactivity in liquefaction: Technical progress report, December 1992–March 1993.** Song, C.; Saini, A.K.; Wenzel, K.; Huang, L.; Hatcher, P.G.; Schobert, H.H. Pennsylvania State Univ., University Park, PA (United States). Dept. of Materials Science and Engineering. Apr 1993. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91042. Order Number DE93014941. Source: OSTI; NTIS; GPO Dep.

This work is a fundamental study of catalytic pretreatments as a potential preconversion step to low-severity liquefaction. The ultimate goal of this work is to provide the basis for the design of an improved liquefaction process and to facilitate our understanding of those processes that occur when coals are initially dissolved. The main objectives of this project are to study the effects of low-temperature pretreatments on coal structure and their impacts on the subsequent liquefaction. The effects of pretreatment temperatures, catalyst type, coal rank and influence of solvent will be examined. We have made significant progress in the following four aspects during this quarterly period: (1) influence of drying and oxidation of coal on the conversion and product distribution in catalytic liquefaction of Wyodak subbituminous coal using a dispersed catalyst; (2) spectroscopic characterization of dried and oxidized Wyodak coal and the insoluble residues from catalytic and thermal liquefaction; (3) the structural alteration of low-rank coal in low-severity liquefaction with the emphasis on the oxygen-containing functional groups; and (4) effects of solvents and catalyst dispersion methods in temperature-programmed and non-programmed liquefaction of three low-rank coals.

22714 (DOE/PC/91043–T6) **An investigation of the role of water on retrograde/condensation reactions and enhanced liquefaction yields: Quarterly progress report, January 1, 1993–March 31, 1993.** Miknis, F.P. Western Research Inst., Laramie, WY (United States). Apr 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91043. Order Number DE93014942. Source: OSTI; NTIS; GPO Dep.

Changes in coal structure that may occur during coal drying will be measured in order to determine the effects of coal drying on its reactivity toward liquefaction. Different methods for coal drying will be investigated to determine if drying can be accomplished without destroying coal reactivity toward liquefaction, thereby making coal drying a relatively economical and efficient method for coal pretreatment. Coal drying methods will include conventional thermal drying, microwave drying and chemical drying at low temperature. State-of-the-art solid-state nuclear magnetic resonance (NMR) techniques using combined rotation and multiple pulse spectroscopy (CRAMPS) and cross polarization with magic-angle spinning (CP/MAS) will be employed: (1) to measures changes in coal structure brought about by the different methods of drying and by low temperature oxidation, and (2) to obtain direct measurements of changes in the aromatic hydrogen-to-carbon ratio of the solid/semisolid material formed or remaining during pretreatment and the initial stages of liquefaction. The objectives for this quarter were to begin coal drying experiments using thermal, microwave, and chemical methods, and to begin coal liquefaction experiments on the dried coals. Three additional coal samples have been acquired. These are a Black Thunder Mine coal acquired from Arco Coal Co, and a Texas subC and Illinois No. 6 hvC acquired from the DOE coal sample bank at Penn State. The samples are listed as DECS-1 and DECS-2, respectively in the PSU sample bank. The ultimate and proximate analyses for all the samples are given in Table 1. Work on each of the subtasks is described in separate paragraphs.

22715 (DOE/PC/91050–T1) **Advanced direct coal liquefaction concepts: Quarterly report, October 1, 1992–December 31, 1992.** Berger, D.J. (Canadian Energy Development, Inc., Edmonton, AB (Canada)); Parker, R.J.; Simpson, P.L. Canadian Energy Development, Inc., Edmonton, AB (Canada); Alberta Research Council, Edmonton, AB (Canada). 1992. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91050. Order Number DE93015054. Source: OSTI; NTIS; GPO Dep.

During the first quarter of FY 1993, the Project proceeded close to the Project Plan. The analysis of the feed material has been completed as far as possible. Some unplanned distillation was needed to correct the boiling range of the Black Thunder solvent used during the autoclave tests. Additional distillation will be required if the same solvent is to be used for the bench unit tests. A decision on this is still outstanding. The solvent to be used with Illinois No. 6 coal has not yet been defined. As a result, the procurement of the feed and the feed analysis is somewhat behind schedule. Agglomeration tests with Black Thunder coal indicates that small agglomerates can be formed. However, the ash removal is quite low (about 10%), which is not surprising in view of the low ash content of the coal. The first series of autoclave tests with Black Thunder coal was completed as planned. Also, additional runs are in progress as repeats of previous runs or at different operating conditions based on the data obtained so far. The results are promising indicating that almost complete solubilization (close to 90%) of Black Thunder coal can be achieved in a CO/H_2O environment at our anticipated process conditions. The design of the

bench unit has been completed. In contrast to the originally planned modifications, the bench unit is now designed based on a computerized control and data acquisition system. All major items of equipment have been received, and prefabrication of assemblies and control panels is proceeding on schedule. Despite a slight delay in the erection of the structural steel, it is anticipated that the bench unit will be operational at the beginning of April 1993.

22716 (DOE/PC/91050–T2) **Advanced direct coal liquefaction concepts: Quarterly report, August 1–September 30, 1992.** Canadian Energy Development, Inc., Edmonton, AB (Canada); Alberta Research Council, Edmonton, AB (Canada). 26 Oct 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91050. Order Number DE93015064. Source: OSTI; NTIS; GPO Dep.

The Project was started August 1, 1992. During these first two months, the Project Management plan was issued and approved during discussions at the Pittsburgh Energy and Technology Centre. Feed materials for the experimental work (with the exception of the second solvent) have been received. The analytical work up of these feed materials has been completed, and autoclave stability tests with the solvent and solvent fraction have been performed and analyzed. The Project is proceeding on schedule.

22717 (DOE/PC/91054–T5) **Effect of pretreating of host oil on coprocessing: Quarterly progress report, July 1, 1992–September 30, 1992.** Wender, I.; Tierney, J.W. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 25 Jan 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91054. Order Number DE93014946. Source: OSTI; NTIS; GPO Dep.

The principal objective of this research is to determine the role host petroleum-derived oils (1000°F+), as well as that of catalytically treated host oils, play when used as liquefaction solvents in coprocessing with coal. The host oils will be extensively characterized and then pretreated in a number of ways which involve catalytic reactions such as hydrogenation, hydrocracking, isomerization, and dehydrogenation. The pretreated oils will then be characterized. The effects of the host oil on coprocessing with coal will be compared to those obtained using catalytically modified heavy oils. When appropriate, model compounds will be used to study specific reactions brought about by the pretreatments. Highly dispersed iron catalysts modified by the addition of small amounts of other metals will be used to modify the chemical composition of the host oils. To date, five different pretreatment reactions have been carried out on the Amoco oil. Table 1 list some properties of this oil. Details of the reaction conditions used are given in Table 2. An objective of the pretreatment reactions is to increase hydrogen content without too significant a breakdown (cracking) of the hydrocarbon structures. Severe cracking could produce a light hydrocarbon solvent which may not be suitable for coprocessing because of its low boiling point. Based on the yield of the pentane soluble fraction, Run 5, with the Shell supported catalyst produced the highest yield of oils. Specifically, the oil content of the starting residuum was increased by more than five percentage points. The next step will be to analyze the products of the pretreatment runs to determine their hydrogen content and other chemical characteristics. The characterization tests will indicate whether the pretreatment reactions were successful in increasing the hydrogen content of the starting heavy oil to the desired levels. If necessary, different pretreatment reactions will be conducted.

22718 (DOE/PC/91059–T4) **Biological upgrading of coal liquids: Quarterly report, October–December 31, 1992.** Engineering Resources, Inc., Fayetteville, AR (United States). 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91059. Order Number DE93014950. Source: OSTI; NTIS; GPO Dep.

Culture screening and performance studies were performed with a variety of cultures in removing nitrogen compounds from coal liquid. Two cultures were shown to be effective in removing 17 and 26 percent of the nitrogen in coal liquid as determined by elemental analysis. Experiments will continue in an effort to find additional cultures and isolates able to degrade nitrogen, as well as oxygen and sulfur as heteroatom compounds, from coal liquids. A biological process for upgrading of coal liquids would offer significant advantages, such as operation at ordinary temperature and pressure with better energy efficiency. Of greater importance is the fact that microorganisms do not require an external supply of hydrogen for heteroatom removal, obtaining required hydrogen from water. Furthermore, the biocatalysts are continuously regenerated by growth on the heteroatom compounds. Ring structures are degraded as the heteroatoms are removed. The heteroatoms are in an inocuous form, such as NH_3, SO_4^{2-} CO_2 and H_2O. Therefore, there is significant potential for the development of an economical biological process for upgrading of coal liquids.

22719 (DOE/PC/91281–T5) **Low severity coal liquefaction promoted by cyclic olefins: Quarterly report, October–December 1992.** Curtis, C.W. Auburn Univ., AL (United States). Dept. of Chemical Engineering. 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91281. Order Number DE93014948. Source: OSTI; NTIS; GPO Dep.

Low severity coal liquefaction promoted by cyclic olefins offers a means of liquefying coal at low severity conditions. Lower temperature, 350°C, and lower hydrogen pressure, 500 psi, have been used to perform liquefaction reactions. The presence of the cyclic olefin, hexahydroanthracene, made a substantial difference in the conversion of Illinois No. 6 coal at these low severity conditions. The Researchperformed this quarter was a parametric evaluation of the effect of different parameters on the coal conversion and product distribution from coal. The effect of the parameters on product distribution from hexahydroanthracene was also determined. The work planned for next quarter includes combining the most effective parametric conditions for the low severity reactions and determining their effect. The second part ofthe research performed this quarter involved performing Fourier transform infrared (FTIR) spectroscopy using cyclic olefins. The objective of this study was to determine the feasibility of using FTIR and a heated cell to determine the reaction pathway that occurs in the hydrogen donation reactions from cyclic olefins. The progress made to date includes evaluating the FTIR spectra of cyclic olefins and their expected reaction products. This work is included in this progress report.

22720 (DOE/PC/91289–T6) **Characterization of the organic-sulfur-degrading enzymes: [Quarterly] technical report, December 1, 1992–February 28, 1993.** Ho, N.W.Y. Purdue Univ., Lafayette, IN (United States). Lab. of Renewable Resources Engineering. 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91289. Order Number DE93014944. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to characterize and purify the enzymes involved in degrading organic sulfur in coal from two well characterized organic sulfur degrading strains, IGTS8 and K3B. We believe that characterization and purification of these enzymes may provide valuable information that will lead to developing or isolating better strains for desulfurization of coal. Our recent results imply that the IGTS8 enzymes are firmly attached to the cell wall, most likely that they are covalently bonded to the cell wall. We believe that for coal desulfurization, it is better to have a microorganism that can secrete its desulfurization enzymes into the medium. The enzymes can penetrate into coal hundreds of times better than a bacterial cell. Thus we have changed the priority of this project. We believe that the isolation of a mutant of IGTS8 which can release the desulfurization enzymes into the cultural medium will be able to develop a much improved microbial process for coal desulfurization. Furthermore, the isolation of sucha mutant will be able to shed some light on how the wild type IGTS8 desulfurization enzyme are attached to the cell wall and make the purification of these enzymes much easier to accomplish.

22721 (DOE/PC/92521–T7) **Stabilization of spent sorbents from coal gasification: Technical report, December 1, 1992–February 28, 1993.** Abbasian, J. (Institute of Gas Technology, Chicago, IL (United States)); Hill, A.H.; Wangerow, J.R.; Banerjee, D.D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013626. Source: OSTI; NTIS; GPO Dep.

The objective of this investigation is to determine the kinetics of reactions involving partially sulfided dolomite and oxygen, which is needed for the design of the reactor system for the stabilization of

sulfide-containing solid wastes from gasification of high sulfur coals. To achieve this objective, samples of partially sulfided dolomite are reacted with oxygen at a variety of operating conditions in a fluidized-bed reactor, where external diffusion limitations are avoided by using small quantities of the sorbent and maintaining a high flow rate of the reactant gas. The reacted sorbents are analyzed to determine the extent of conversion as a function of operating variables including sorbent particle size, reaction temperature and pressure, and oxygen concentration. Samples of the partially sulfided dolomite were reacted with oxygen in the fluidized-bed rector at different operating conditions. The test parameters included the effects of solid residence time, oxygen concentration, and reaction temperature. The reacted solids were analyzed to determine the extent of CaS conversion to $CaSO_4$. The results of the tests conducted so far in the project indicate that the extent of conversion increase with increasing oxygen concentration and the solid residence time. The rate of reaction appears to be very sensitive to the reaction temperature.

22722 (DOE/PC/92521–T13) **NA/CA catalyzation of Illinois coals for gasification: Technical report, December 1, 1992–February 28, 1993.** Jha, M.C. (AMAX Research and Development Center, Golden, CO (United States)); McCormick, R.L.; Banerjee, D.D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013632. Source: OSTI; NTIS; GPO Dep.

Three of the most pressing technical problems in gasification of Illinois coals are high reaction temperatures, agglomerating tendency of the coals, and sulfur content of the product gas. This program explores the use of gasification catalysts which reduce gasification temperature, agglomeration tendency, and sulfur emissions. The catalysts are sodium/calcium mixtures and are active at loadings less than 1 weight percent, although higher loading may be required. During the second quarter, we have continued work, "Catalyzed Coal Preparation and Characterization." We have also initiated work on, "Bench Scale Gasification Tests." Work included expansion of the test series for wet impregnated IBC-105 coal. It was determined that catalyst addition at pH 4.5 or lower resulted in almost complete elimination of caking tendency as determined by measurement of the free swelling index (FSI). Characterization of this suite of samples by FTIR, CO_2 Chemisorption (to measure catalyst dispersion), and TGA gasification rate was also performed. Results show correlations between impregnation pH and catalyst dispersion (low pH = high dispersion) and between dispersion and reaction rate. FTIR results suggest the formation of highly dispersed catalyst by interaction with the coal hydroxyl groups.

22723 (DOE/PC/92521–T19) **Microbial strain improvement for organosulfur removal from coal: Technical report, December 1, 1992–February 28, 1993.** Kilbane, J.J. II (Institute of Gas Technology, Chicago, IL (United States)); Ho, K. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013638. Source: OSTI; NTIS; GPO Dep.

IGT has developed a microbial culture of Rhodococcus rhodochrous, designated as IGTS8, that is capable of specifically cleaving carbon-sulfur bonds in a range of organosulfur model compounds and is capable of removing organic sulfur from coal and petroleum without significantly sacrificing the calorific value of the fuel. Although IGTSS possesses the ability to specifically remove organic sulfur from coal, a major research need is to develop strains of microorganisms that possess higher levels of desulfurization activity. During the past quarter, the DNA sequence of the promoter region of the chloramphenicol resistance gene of pRF2 was determined and tentatively localized to a 50 bp region. To further define the important sequences of this promoter mutants were generated that may have altered promoters allowing higher levels of expression of the chloramphenicol resistance gene. The promoter region from twenty such mutants has been subcloned. Additionally, promoter probe vectors were used to isolate small DNA fragments from the chromosome that possess promoters. These studies will lead to the identification and/or the construction of particularly strong Rhodococcus promoters which will subsequently be used to express the desulfurization genes.

22724 (DOE/PC/92521–T30) **Investigation of a sulfur reduction technique for mild gasification char: Technical report, December 1, 1992–February 28, 1993.** Knight, R.A. (Institute of Gas Technology, Chicago, IL (United States)); Banerjee, D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1993]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013649. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to investigate the desulfurization of mild gasification char using H_2:CH_4 mixtures. Mild gasification of coal produces char, liquids, and gases at 1000°–1500°F (538°-816°C) and near-ambient pressure. Char, comprising 60–70% of the product, can be used to make high-value form coke for steelmaking and foundries. However, a sulfur content below 1 wt% is desirable, and char from high-sulfur Illinois coals must be upgraded to meet this criterion. Illinois No. 6 chars were treated in a 2-inch batch fluidized-bed reactor with H_2:CH_4 blends containing 9–24 vol % CH_4 at 1100°-1600°F (538°-871°C) and 50–200 psig (0.35–1.38 Mpa). The data from these tests show sulfur removal of 6.0–92.5 wt % and carbon losses of 0.0–25.6 wt %, with the desulfurization susceptibility of char related to porosity, density, and crystallite size. The relationships among mild gasification parameters, char properties, and char desulfurization susceptibility are being studied. Acid washing of char to remove Ca and Fe is being explored for its effect on subsequent sulfur removal. Secondary desulfurization of form coke produced from the desulfurized chars is also being studied, and a final recommendation will be made for integration of char desulfurization into the IGT MILDGAS process.

22725 (DOE/PC/92521–T32) **Mild temperature gasification: Partitioning sulfur to gas as H_2S: Technical report, December 1, 1992–February 28, 1993.** Stencel, J.M. (Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research); Neathery, J.K.; Schaefer, J.L.; Yang, J.; Banerjee, D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013652. Source: OSTI; NTIS; GPO Dep.

Bench-scale, mild-temperature fluidized bed gasification (MTFBG) of three high sulfur Illinois basin coals (IBC) mixed with phosphoric acid will be performed to initiate development of an advanced processing technology which partitions coal sulfur to the gas phase as H_2S. The influence of coal type, coal agglomeration, and steam injection on the properties of the solid, condensible and gaseous products produced during MTFBG will be examined. Analytical measurements of the products will be obtained and are designed to provide product quality and quantity. Combustion reactivity testing of the char, and pressurized, hot water extraction of H_3PO_4 from the char, will be performed to provide information for design of a continuous and integrated process for the removal and recovery of coal sulfur. During this quarter, the acquisition and construction of equipment to be used for MTFBG of Illinois coals and hot water, pressurized filtration of chars were completed. IBC 106 was subjected to fluidized bed gasification testing under nitrogen and steam/nitrogen atmospheres. The percentage of total sulfur removed from the parent coal using physical cleaning followed by MTFBG of coal/phosphoric acid mixtures was as high as 94% at a gasification temperature of 500°C.

22726 (DOE/PC/92527–T2) **Hindered diffusion of coal liquids: Quarterly report No. 2, December 18, 1992–March 17, 1993.** Tsotsis, T.T. (University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering); Sahimi, M.; Webster, I.A. University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering; Unocal Corp., Los Angeles, CA (United States). 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92527. Order Number DE93014966. Source: OSTI; NTIS; GPO Dep.

Throughout the experimental runs we utilize a high pressure, high temperature diffusion cell system. This diffusion system has been tested through the measurement of the diffusivity of a number of model coal liquids. The heart of the experimental system is a high pressure autoclave, which in its interior can accommodate

one or several ceramic membranes. One side of these membranes is exposed to the contents of the autoclave, while the other side, through an independent flow system, is exposed to flowing pure solvent. The pressure in the interior and exterior of the membranes can be independently adjusted and controlled. This is also true with the flow rate of the solvent in the interior of the membrane. The diffusion experiments are initiated by placing the coal liquid solution (model liquids or asphaltenes) in the autoclave space exterior of the membrane, pressurizing the exterior and interior membrane volumes and initiating the flow of the solvent. One has the option of running the experiment in a batch (exterior)-continuous (interior) or batch-batch mode. The option also exists for loading catalyst in the exterior volume either in a pellet or slurry form or using metal impregnated membranes for simultaneously studying transport and reaction. Model membrane preparation and characterization will be carried out both at USC at the UNOCAL Science and Technology Division, of UNOCAL Corporation (USTD). UNOCAL, in addition, will contribute technician and machine time on apparatuses, such as Auger and XPS, preparative GPC, SEC, XRF, SEC/ICP, Low Angle Light Scattering Photometer, Electron Microscope, Atomic Adsorption, Porosimeters and BET. The project is of both experimental and theoretical nature and is divided into a number of tasks, a brief description of which.

22727 (DOE/PC/92531–T1) **Heteronuclear probes of coal structure and reactivity: Quarterly report, October 30, 1992–January 31, 1993.** Iowa State Univ. of Science and Technology, Ames, IA (United States). Iowa State Mining and Mineral Resources Research Inst. [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92531. Order Number DE93015056. Source: OSTI; NTIS; GPO Dep.

One of the goals of the proposal was to take advantage of the thermodynamically strong P-S bond to remove sulfur from solid coals with organophosphorus compounds. Using commercially available Bu_3P, we were very pleasantly surprised (after a number of runs carried out by Dr. Mohan, see Table 1) to realize how well this worked on an Illinois No. 6 sample in run No. 5. Using the quantitative ^{31}P NMR technique we have very recently developed for phenols in liquid coal materials in collaboration with CONSOL (see proposal), we have determined from integration of the Bu3PS peak in the Bu_3P extract (49 ppM), that of the 5.31% total sulfur present in the coal sample, we were able to extract 4.83% of it into the Bu_3P. This represents removal of 91% of the sulfur. What makes this result particularly exciting is that in separate experiments, Bu_3P is unsuccessful in removing sulfur from thiophene or from FeS. This rather forcefully reminds us once again that chemistry in the coal matrix can be very different from that on model compounds.

22728 (DOE/PC–93007525, pp. 18-25) **Overview of the Pittsburgh Energy Technology Center.** USDOE Pittsburgh Energy Technology Center, PA (United States). 1993. In *PETC Review: Issue 7, Winter 1992–1993.* 52p. Order Number DE93007525. Source: OSTI; NTIS.

In previous issues of the PETC Review, the authors discussed various projects and programs being conducted by and for the Pittsburgh Energy Technology Center (PETC). This issue reviews some of the mechanisms that allow outside sources (e.g., universities, private-sector corporations, individuals) to perform work for the US Department of Energy (DOE) through funding from PETC; PETC's mission and organization; and the procurement mechanisms within DOE, including a summary of key terms and processes involved in the procurement and contract evaluation process.

22729 (PNL-SA–21664) **Results of catalyst testing using iron-based catalysts.** Linehan, J.C.; Darab, J.G.; Matson, D.W. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930304–16: 205. American Chemical Society national meeting, Denver, CO (United States), 28 Mar - 2 apr 1993). Order Number DE93010794. Source: OSTI; NTIS; GPO Dep.

As coal liquefaction catalysts, iron-based products are generally inferior to the more expensive molybdenum, cobalt, or nickel-based materials. However, the lower costs of production and recovery (or in the case of some iron catalysts, non-recovery) give the iron-based materials a potential economic advantage over the more efficient precious and semi-precious metal catalysts for this application. Recent research has shown that a number of different iron-containing materials can be successfully utilized as coal liquefaction catalysts or as catalyst. Pyrrhotite ($Fe_{1-x}S$) or a similar iron-sulfide phase is commonly believed to be the active catalyst in coal liquefaction and model compound pyrolysis reactions, although no specific phase has been yet been isolated as the actual catalyst species. The active iron-containing catalyst is usually generated in situ from an iron-oxide precursor and an elemental sulfur source under reducing conditions in the reactor vessel. Most research has concentrated on the use of common iron-oxide phases such as hematite or goethite (and their derivatives) as the iron-bearing precursor, or on non-specific iron materials produced by the reaction of various iron salts and compounds in the coal or liquefaction reactor. To our knowledge there has been no systematic effort to determine the optimum iron-containing precursor phase for producing active coal liquefaction catalysts, despite the fact that there are over ten iron-(hydroxy)oxide phases which can be easily synthesized in the laboratory. We have undertaken a systematic study to identify the most active iron-oxide catalyst precursor phases, the co-catalysts, and the coal pretreatments which will provide optimum yields in coal liquefaction processes.

22730 (PNL-SA–21665) **Preparation of ultrafine catalyst powders using a flow-through hydrothermal process.** Matson, D.W.; Linehan, J.C.; Darab, J.G. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930304–15: 205. American Chemical Society national meeting, Denver, CO (United States), 28 Mar - 2 apr 1993). Order Number DE93011603. Source: OSTI; NTIS; GPO Dep.

The rapid thermal decomposition of solutes (RTDS) process was used to produce ultrafine iron-bearing oxide and hydroxide powders for use as coal liquefaction catalysts. The RTDS process subjects aqueous solutions containing dissolved metal salts to elevated temperatures and pressures in a flow-through apparatus. Particle formation is initiated during brief exposure of the solution to a heated region, then is quenched by abruptly cooling and depressurizing the suspension. Powders having individual crystallites on the nanometer to tens-of-nanometer size scale are readily produced by the RTDS method. Variations in RTDS processing parameters (e.g., solute concentration, flow rate, processing temperature) affect the crystallinity, morphology, and size of particles produced. Powders generated using the RTDS process were characterized using XRD, EXAFS, electron microscopy, Mossbauer spectroscopy, and BET surface area analysis.

22731 (CONF-9207203–, pp. 67-70) **Roles of non-covalent interactions in coal structure.** Iino, M. (Tohoku University, Sendai (Japan). Institute for Chemical Reaction Science); Liu, H.; Sanokawa, Y.; Takanohashi, T.; Nakamura, K.; Murata, S.; Nomura, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

To elucidate the non-covalent bonding interactions in the coal structure, investigation was made on the solubility of coal by taking several types of electronic donator and acceptor as an additive. Pyridine insoluble (PI) was obtained by extracting extract from Upper Freeport bituminous coal at ordinary temperature with mixed CS2-N-methyl-2-pyrrolidinone (NMP) solvent and reextracting acetone insoluble from the above extract with pyridine. Redissolution

experiment was made by adding the PI fraction and additive to the CS2-NMP. Without additive, the solubility was only 55.1% through association based on the non-covalent bonding interactions in the PI fraction. However, most of the PI fraction was made to dissolve with addition of 7,7,8,8-tetracyanoquinodimethane (TCNQ), tetracyanoethylene (TCNE) and p-phenylenediamine which are electronic donators and acceptors to contribute to the interactions of electric change's moving type. Complex formation was suggested between the PI fraction and TCNE from the UV absorption spectra. Therefore, it is judged that the interactions (association) in the PI fraction itself are attacked and released by the added TCNE, which simultaneously produces a new complex of electric charge's moving type between the PI fraction and TCNE, and then, makes the PI fraction dissolve. 2 refs., 3 figs., 2 tabs.

22732 (CONF-9207203–, pp. 71-74) **Molecular movement of electronic acceptor-doped coal and its interaction with solvent.: Change of intermolecular cohesion in coal by heat treatment.** Sasaki, M. (Government Industrial Development Laboratory, Hokkaido, Sapporo (Japan)); Nagaishi, H.; Kotanigawa, T.; Kumagai, H.; Sanada, Y. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

From the solvent swelling phenomenon at room temperature, study was made of how the bridge formation and other intermolecular cohesions by the covalent bonding in coal structure change in the heating process. The swelling velocity of coal by solvent was judged to be influenced by the resisting action based on the coal structure (bridge formation, etc.) against the diffusion of solvent molecules. Therefore, the swelling velocity was taken notice of. Coal treated at 420 centigrade was lower in initial swelling velocity than raw coal. It was because the proceeding of thermal decomposition and polymerization of coal by the heat treatment at 420 centigrade increased the number of bridges formed by the covalent bonding and consequently intensified the obstruction to the diffusion of solvent molecules. On the other hand, coal treated at 300 centigrade was higher in initial swelling velocity than raw coal. It was judged to be because without proceeding of chemical reaction at 300 centigrade, the obstruction to the diffusion was loosened as the intermolecular cohesions by the others than the covalent bonding were destroyed by heat. The coal treated at 300 centigrade was higher in equilibrated degree of swelling than the raw coal, which was caused by the difference in initial swelling velocity. The equilibrated degree of swelling seems to be predictable from the initial swelling velocity. 1 ref., 2 figs.

22733 (CONF-9207203–, pp. 80-81) **Empirical evalution of affinity between macromolecular strucutre of coal and penetrating molecule.** Aida, T. (Kinki University, Osaka (Japan). Faculty of Engineering in Kyushu); Suzuki, S.; Yamawaki, N.; Fujii, M.; Yoshihara, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Experimental studies were carried out with an objective to derive an equilibrium swelling value when extracting solvent solubles from coal. The coal used in the experiment was stored in nitrogen gas and depressurized and dried for three hours at 110°C before measurement. The organic solvent was dried and distilled. Relationship between concentrations of solutions in which butyl amine derivatives with different three-dimensional bulk heights are dissolved in methanol and the equilibrium swelling values was derived experimentally. The result showed that n-butyl amine with less steric hindrance showed a linear relationship, and tert-butyl amine with more steric hindrance had the swelling value depressed low in a single solution, but restored by adding methanol. Therefore, this was extrapolated where a latent swelling value was derived. The ratio of the equilibrium swelling values obtained for different solutions and reaction agents using dimethylformaldehide (DMF) as a reference solvent to the equilibrium swelling values of DMF alone was defined as a parameter to represent the affinity. 2 figs.

22734 (CONF-9207203–, pp. 86-91) **Studies on coal chemical structure based on combined data of solid state NMR spectroscopy and thermal pyrolysis.** Nomura, M. (Osaka University, Osaka (Japan). Faculty of Engineering); Murata, S.; Tajima, Y.; Nagasaka, N.; Adachi, N.; Nakamura, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Unit chemical structure of Akabira coal was inferred using a solid state NMR and a pyrolysis. Its molecular weight was inferred to be 5765.15, and the composition formula was C383H372O38N6. The following problems surfaced during the inference work: (1) accurate measurement of molecular weights of extracts, (2) the Curie-point pyrolysis accompanying a large amount of caulking, (3) chemical bonds that link aromatics and their quantitative inference, and (4) quantification of CP/MAS ^{13}C-NMR spectra. This paper describes the molecular weight measurement in (1) and the inference on chemically bonded species in (3) by means of molecular weight measurement using light scattering method, and deuterization studies. The results of the light scattering measurement on coal extracts were 750,000 with AS, 900,000 with H-AS-1 and 660,000 with H-AS-2 for those hydrogenated under normal temperature. With regard to a Curie-point pyrolysis on HS and HI-BS, the experiment has not provided a definite result as to how the aromatic rings are linked when this method is used. 14 refs., 3 figs., 2 tabs.

22735 (DOE/PC/90284–10) **Molecular accessibility in solvent swelled coals: Quarterly report, May 1993.** Kispert, L.D. Alabama Univ., University, AL (United States). Dept. of Chemistry. 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90284. Order Number DE93014975. Source: OSTI; NTIS; GPO Dep.

An EPR technique developed in this lab has been used to determine the pore size and number distribution changes after swelling the coal samples with various solvents. Stable nitroxide radical spin probes of different sizes, shapes and reactivity are dissolved in an appropriate solvent, the coal sample is then added to the resulting solution, stirred over night at elevated temperature, filtered, washed with a non swelling solvent to eliminate any spin probes that are not trapped in the pores and the spin concentration is measured. Comparing these spin probe measurements to DRIFT data have shown that the relative number distribution of acidic functionalities can be accurately predicted by the spin probe method. The spin probe method had also been used to predict the increase in elongated voids in Pittsburgh No. 8 (APCS No. 4) upon swelling with pyridine in agreement with independent SANS data. NMR relaxation data show that it is possible to deduce the pore (accessibility) distribution as a function of size (up to 6 nm). It has also been possible by variable temperature and ENDOR measurements to determine the presence of hydrogen bonding as a function of pore shape and size. The advantage of the EPR method is that it permits molecules of selected shape, size and reactivity to be used as probes of accessible regions of coal, thus providing information of importance to the diffusion and reactivity behavior of catalysts in coal.

22736 (DOE/PC/91302–6) **Hydrothermal reactions of fly ash: [Quarterly] report, January 1, 1993–March 31, 1993.** Brown, P.W. Pennsylvania State Univ., University Park, PA (United States). 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91302. Order Number DE93014519. Source: OSTI; NTIS; GPO Dep.

The reactions which occur when fly ash is treated under hydrothermal conditions are being investigated. This is being done for two primary reasons. The first of these is to determine the nature of the phases that form, to assess the stabilities of these phases in the ambient environment and, finally, to assess whether these phases are capable of sequestering hazardous species. The second reason for undertaking this proposed study is that, depending on the composition of the ash and the presence of selected additives, it may be possible under hydrothermal conditions to form

compounds which have cementitious properties.Formation of four classes of compounds, which bracket likely fly ash compositional ranges, have been selected for study. These are calcium silicate hydrates, calcium silicosulfates, calcium aluminosulfates, andalkali aluminosilicates. The specific compounds fabricated will be determined and their stability regions assessed. As a part of stability assessment, the extent to which selected hazardous species are sequestered will be determined. Finally, the cementing properties of these compounds will be established.

22737 (DOE/PC/91305–5) **Characterization of porosity via secondary reactor: Quarterly technical progress report, 1 October 1992–31 December 1992.** Calo, J.M. Brown Univ., Providence, RI (United States). Div. of Engineering. 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91305. Order Number DE93014518. Source: OSTI; NTIS; GPO Dep.

In this quarterly technical Progress report, we summarize the progress which has been achieved with the development of the small angle scattering capability to be used in the current project. In particular, the following was accomplished during the reporting period. The parameter estimation code, MARQFIT, has been tested and is fully operational. The code has been applied to small angle neutron scattering (SANS) data on coals swollen with deuterated solvents. Application of the FPPS model to these data indicated that the large sphere distribution apparently requires a mean greater than 1000Å. This was attributed to the influence of interparticle voids. Specific surface areas were also estimated for these coals. Application of this model to the coal chars used in the current project will not be subject to the same effects.

22738 (DOE/PC/92521–T28) **Mass spectral study of organic sulfur in the polymeric matrix of coal: Technical report, December 1, 1992–February 28, 1993.** Hanley, L. (Illinois Inst. of Tech., Chicago, IL (United States). Dept. of Chemistry); Ho, K. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013647. Source: OSTI; NTIS; GPO Dep.

This report reviews the sixth quarter progress of a two year project to examine the chemical environment of organic sulfur in the polymeric matrix of Illinois coal by laser desorption ion trap mass spectrometry. This project is attempting to develop new laser desorption-ionization schemes for coal which preserve the polymeric matrix. During this quarter, we extended experiments utilizing ultraviolet matrix assisted laser desorption ionization to the examination of solvent extracts of coal. Regardless of the matrix compound, concentration, or laser wavelength chosen, only carbon cluster ions were observed in the mass spectra. During the next quarter, we will attempt to apply laser desorption of neutral compounds followed chemical ionization to form intact molecular ions from the polymeric component of coal.

22739 (DOE/PC/92544–2) **Vapor pressures and heats of vaporization of primary coal tars: Quarterly technical progress report, 1 October 1992–31 December 1992.** Suuberg, E.M. Brown Univ., Providence, RI (United States). Div. of Engineering. [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92544. Order Number DE93014958. Source: OSTI; NTIS; GPO Dep.

The vapor pressure correlations that now exist for coal tars are quite crude. Sophisticated general correlative approaches are slowly being developed, based upon group contribution methods, or based upon some key functional features of the molecules. These are as yet difficult to apply to coal tars. The detailed group contribution methods, in which fairly precise structural information is needed, do not lend themselves well for application. to very complex, poorly characterized coal tars. The methods based upon more global types of characterizations have not yet dealt much with the question of oxygenated functional groups. In short, only very limited correlations exist, and these are not considered reliable to even an order of magnitude when applied to tars. The present project seeks to address this important gap in the near term by direct measurement of vapor pressures of coal tar fractions, by application of well-established techniques and modifications thereof. The principal objectives of the program are to: (1) obtain data on the vapor pressures and heats of vaporization of tars from a range of ranks of coal, (2) develop correlations based on a minimum set of conveniently measurable characteristics of the tars, (3) develop equipment that would allow performing such measurements in a reliable, straightforward fashion.

22740 (DOE/PC/92521–T2) **Microbial stabilization of sulfur-laden sorbents: Technical report, December 1, 1992–February 29, 1993.** Miller, K.W. (Illinois State Univ., Normal, IL (United States)); Banerjee, D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013620. Source: OSTI; NTIS; GPO Dep.

Clean coal technologies that involve limestone for in situ sulfur capture generate lime/limestone products laden with sulfur at various oxidation states. If sulfur is completely stabilized as sulfate, the spent sorbent is ready for commercial utilization as gypsum. However, the presence of reduced sulfur species requires additional processing. Thermal oxidation of reduced sulfur frequently results in undesirable release of SO_2. Microbial oxidation may provide an inexpensive and effective alternative. Sorbents laden with reduced forms of sulfur such as sulfide or sulfite can serve as growth substrates for sulfur-oxidizing bacteria, which convert all sulfur to sulfate. The goals of this project are to optimize conditions for sulfate generation from sulfide and sulfite on prepared lime/limestone mixtures; to test and optimize the effectiveness of microbial processing on spent sorbents from coal gasification, in-duct sorbent injection, and fluidized bed combustion; and to search for hyperalkalinophilic thiobacilli, which would be effective up to pH 11. We report here progress toward controlling the pH of culture media, and determining the highest pH at which several environmental isolates and named strains could initiate sulfur oxidation.

22741 (DOE/PC/92521–T3) **Recovery and utilization of gypsum and limestone from scrubber sludge: Technical report, December 1, 1992–February 28, 1993.** Kawatra, S.K. (Michigan Technological Univ., Houghton, MI (United States). Dept. of Metallurgical and Materials Engineering); Eisele, T.C.; Banerjee, D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013621. Source: OSTI; NTIS; GPO Dep.

Wet flue-gas desulfurization units in coal-fired power plants produce a large amount of sludge which must be disposed of, and which is currently landfilled in most cases. Increasing landfill costs are gradually forcing utilities to find other alternatives. In principle, this sludge can be used to make gypsum ($CaSO_4$-$2H_2O$) for products such as plaster-of-Paris and wallboard, but only if impurities such as unreacted limestone and soluble salts are removed, and the calcium sulfite ($CaSO_3$) is oxidized to calcium sulfate ($CaSO_4$). This project is investigating methods for removing the impurities from the sludge so that high-quality, salable gypsum products can be made. Work done in the previous quarter concentrated on developing a dependable technique for analysis of scrubber sludge, so that it would be possible to determine exactly how well a particular purification process was working. This technique was then used to characterize the sludge from a particular Illinois power station. In the current quarter, studies were carried out using froth flotation to produce a product that could be oxidized to high-purity gypsum. These experiments have been quite successful, due to certain properties of the limestone impurity that makes it easier to remove by this method than was expected.

The United States is well positioned to play an expanding role in meeting the energy technology demands of the Asian Pacific Basin, including Indonesia, Thailand, and the Republic of China (ROC-Taiwan). The US Department of Energy Clean Coal Technology (CCT) Demonstration Program provides a proving ground for innovative coal-related technologies that can be applied domestically and abroad. These innovative US CCTs are expected to satisfy increasingly stringent environmental requirements while substantially improving power generation efficiencies. They should also provide distinct advantages over conventional pulverized coal-fired combustors. Finally, they are expected to be competitive with other energy options currently being considered in the region. This paper presents potential technology scenarios for Indonesia, Thailand, and the ROC-Taiwan and considers an environmental cost-benefit approach employing a newly developed method of applying environmental externalities. Results suggest that the economic benefits from increased emission control can indeed be quantified and used in cost-benefit comparisons, and that US CCTs can be very cost effective in reducing emissions.

[153p.] (CONF-9206363–: Field workshop on ecological stability of landscape, ecological infrastructure and ecological management, Kostelec nad Cernymi Lesy (Czechoslovakia), 15-20 Jun 1992). Order Number DE93624591. Source: OSTI; NTIS (US Sales Only); INIS.

The Field Workshop 'Ecological Stability of Landscape - Ecological Infrastructure - Ecological Management' was held within a State Environmental Programme financed by the Federal Committee for the Environment. The objectives of the workshop were to present Czech and Slovak approaches to the ecological stability of the landscape by means of examples of some case studies in the field, and to exchange ideas, theoretical knowledge and practical experience on implementing the concept of ecological infrastructure in landscape management. Out of 19 papers contained in the proceedings, 3 items were inputted to the INIS system. (Z.S.).

22744 (INIS-mf–13519, pp. 125-130) **Restoration of territorial system of ecological stability in the North-Bohemian brown coal basin.** Stys, S. (ECOCONSULT Ltd. Most (Czechoslovakia)). Federal Committee for Environment, Prague (Czech Republic); Institute of Applied Ecology, Kostelec nad Cernymi Lesy (Czech Republic). 1992. Source: OSTI; NTIS (US Sales Only); INIS.

Natural and socio-economic factors and technological procedures are discussed in restoring the North Bohemian brown coal basin area affected by mining. Some results are presented of restoration activities carried out systematically since 1952. At the end of 1991 the whole basin reclamation was completed on 6409.23 ha and uncompleted on 3096.89 ha. At present, long-term reclamation plans are under preparation with a time horizon of 2030 when the mining activity is supposed cease. (Z.S.) 1 tab.

Source: OSTI; NTIS (US Sales Only); INIS.

Some results, conclusions and suggestions are presented that emerged from the study on spontaneous succession which started in 1977. Trends in spontaneous succession are briefly described. Under certain conditions, spontaneous succession is the cheapest reclamation method. On marginal heap slopes, tree planting is recommended as the most rapid reclamation measure. The expansion of grasses and trees can be accelerated by their artificial sowing or planting. Arrhena therum elatius seems to be the most suitable among grasses, and Betula verrucosa among woody species to be sown and then successfully established. The best time is usually between the 6th and 10th years of spontaneous succession. (Z.S.) 1 fig., 4 refs.

Federal Committee for Environment, Prague (Czech Republic); Institute of Applied Ecology, Kostelec nad Cernymi Lesy (Czech Republic). 1992. (CONF-9206363–: Field workshop on ecological stability of landscape, ecological infrastructure and ecological management, Kostelec nad Cernymi Lesy (Czechoslovakia), 15-20 Jun 1992). In *Proceedings of the field workshop on ecological stability of landscape, ecological infrastructure and ecological management.* [153p.] Order Number DE93624591. Source: OSTI; NTIS (US Sales Only); INIS.

Two approaches are presented to the afforestation of damaged areas, i.e., the concept based on introduction of species and that based on use of pioneer species. Natural succession is a less risky way of afforestation for the localities most damaged by air pollution; directed succession is probably the fastest way to reach the climax composition of species again. Liming and fertilizing should not be used schematically. Their use prior to planting or sowing is recommended. (Z.S.) 1 fig., 5 refs.

0130 Transport, Handling, and Storage

22748 (CONF-9207203–, pp. 101-104) **Demonstration test of coal-water slurry fuel.** Onaka, A. (Ube Industries, Ltd., Yamaguchi (Japan)); Wada, T.; Sawada, M.; Umitsu, A.; Nakai, S. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

A demonstration test of slurry fuel was conducted for possible practical use of high-concentration coal-water slurry (CWM). A total system was structured for this demonstration test from CWM manufacture to storage and transportation, and to combustion. It was verified that in the manufacturing test the filling performance of coal particles that governs raising of CWM concentration is nearly

the same as in the pilot facility and variations in pulverability and other properties due to coal types can be coped with. In the storage and transportation test, it was proved that the fuel can be handled as for heavy oil, including repetition of long-term storage, receiving and delivery. The combustion test indicated that when CWM exclusive burning using standard coal is compared with coal/heavy oil mixture burning, NOx emission was slightly higher and the combustion efficiency was somewhat worse, but the differences were not large. Difference due to grain sizes of coal particles was also relatively small. Dust collecting performance was better than the coal/heavy oil burning. Load followability was as good as oil burning boilers. 2 refs., 3 figs., 3 tabs.

22749 (CONF-9207203–, pp. 105-108) **Study of slurryability.** Suetsugu, K. (Ube Industries Ltd., Yamaguchi (Japan)); Sawada, M.; Sawamura, Y.; Nakai, S. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Comparisons and discussions were given on coal-water slurries made by dry and wet manufacturing processes as to their slurryability. The dry-method slurries were manufactured by dry-pulverizing four types of coal to make five test samples having different grain size distributions according to each type of coal, added with water, dispersant, and pH adjusting agent. The wet-method slurries were manufactured by pulverizing coals to 3 mm under, and charging them into a batch mill with water, dispersant, and pH adjusting agent to mix them in a wet condition. When the dry-method and wet-method slurries were prepared in a laboratory, the dry-method slurries were possible of raising the concentration higher than that for the wet-method slurries even in samples having identical grain size distribution. A cause for this difference could be ash suspended in the slurries affecting the slurryability. However, this difference in slurryability is not caused simply from amount of free ash, but chemical compositions and suspending conditions of the free ash, which may affect the fluid characteristics of the slurries and work as an apparent impeding factor for raising the concentration. 2 refs., 7 figs., 2 tabs.

22750 (OCDO–93013795) **A novel coal feeder system: Final report.** Keener, T.C. (Cincinnati Univ., OH (United States). Dept. of Civil and Environmental Engineering). Ohio Coal Development Office, Columbus, OH (United States); Cincinnati Univ., OH (United States). Dept. of Civil and Environmental Engineering. 14 Jan 1991. 68p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, Box 1001, Columbus, OH 43266-0001.

A novel coal feeder system has undergone testing and evaluation at the University of Cincinnati. The system consists primarily of an auger feed tube which is used to both convey and provide desulfurization of a high sulfur coal feedstock. The coal is conveyed at temperatures ranging from 350 to 550°C and under normal atmospheric pressure. Under these mild processing conditions, the coal partially pyrolizes and emits sulfur in the form of hydrogen sulfide while maintaining a relatively high heating value in the char product ne evolved gases are evacuated from the reactor (the feed tube) to another absorbing bed where H_2S reacts with the sorbent, usually lime or limestone. The result sorbent utilization substantially higher than the values found in current dry scrubbing system and the produced low-sulfur char may then be used in a conventional steam boiler. The current experimental results revealed that at a low temperature (375°C) fractional devolatilization of an Ohio #8 coal increases linearly with increasing residence time while fractional desulfurization approaches an exponential maximum value of about 32 percent as residence time goes to infinity. When desulfurization reaches to 30 percent at 8 minutes residence time, the devolatilization is only about 5 percent (mass basis). This implies that longer residence time may not necessarily produce desirable fuel products in terms of sulfur loss vs. heat value loss. A problem encountered in this research is the tendency of the coal to swell and become sticky at temperatures above 450°C (this is true for all non-caking coals). Methods to eliminate this problem are currently being investigated under a grant from the US Department of Energy.

22751 (CONF-9207203–, pp. 109-110) **Emissions of NOx and N2O from a circulating fluidized bed combustor.** Shimizu, T. (Niigata University, Niigata (Japan). Faculty of Engineering); Tachiyama, T.; Wakayama, O.; Fujita, D.; Kumazawa, K.; Inagaki, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Three types of coal with different volatility were used to evaluate effects of limestone charged into a coal circulating fluidized bed combustor on emission of NOx and N2O. The limestone is the one produced in Chichibu, Japan (CaCO3 content at 96.3% and size from 0.25 mm to 0.35 mm), and supplied into the combuster using impulse charging and continuous charging methods. As the limestone is charged, SO2 concentration decreases (desulfurization rate increases), when N2O emission dropped and NOx emission rose. Results of impulse charging and continuous supply agreed well with each other. The N2O and NOx emission depends on desulfurizing activity of the limestone in a furnace, and is not affected by the supply systems. The N2O emission was decreased by about 10% to 30%. The more the volatile components the coal has, the more the N2O reduction effect. However, no distinctive volatility dependence was observed with regard to the increase rate of NOx. 5 refs., 2 figs., 1 tab.

22752 (DOE/FTR–93013018) **[Travel to Australia to attend the 24th international symposium on combustion at the University of Sydney]: Foreign trip report, June 29–July 19, 1992.** Hurt, R.H. Sandia National Labs., Livermore, CA (United States). 12 Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93013018. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the proceedings of the 24th Combustion Symposium in Sydney, Australia relevant to DOE/FE programs. Also summarized are technical exchanges during site visits to (1) The Newcastle Laboratories of BHP Co., hosted by Dr. John Truelove; (2) Lucas Heights Research Laboratories of the CSIRO, hosted by Dr. David Death and Dr. John Eberhard; (3) the coal combustion research group of Professor Terry Wall, Chemical Engineering Department of the University of Newcastle; (4) The Division of Coal and Energy Technology of the CSIRO at the North Ryde Research Laboratories, hosted by Dr. David Harris.

22753 (DOE/FTR–93013555) **[Travel to Trondheim, Norway to participate in the IEA task leaders meeting]: Foreign trip report, June 20–27, 1992.** Marx, K.D.; Carling, R.W. Sandia National Labs., Livermore, CA (United States). 14 Aug 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93013555. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The meeting was attended by approximately 43 people from 10 countries. This includes 15 attendees from Norway, the host country. The technical sessions, comprised of 39 papers, were held on Monday–Wednesday, June 22–24. Thursday morning, June 25, was devoted to a tour of Marintek, the Marine Technology Center at the Norwegian Institute of Technology. The IEA Executive Committee meeting was held on Friday, June 26. The entire trip, including travel to and from Trondheim, extended from June 20 through June 27. An itinerary, a meeting agenda, and a list of attendees are attached.

22754 (DOE/MC/10637–3313) **EERC pilot-scale CFBC evaluation facility Project CFB test results: Topical report, Task 7.30.** Mann, M.D.; Hajicek, D.R.; Henderson, A.K.; Moe, T.A. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Sep 1992. 360p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-86MC10637. Order Number DE93000253. Source: OSTI; NTIS; GPO Dep.

Project CFB was initiated at the University of North Dakota Energy and Environmental Research Center (EERC) in May 1988. Specific goals of the project were to (1) construct a circulating fluidized-bed combustor (CFBC) facility representative of the major boiler vendors' designs with the capability of producing scalable data, (2) develop a database for use in making future evaluations of CFBC technology, and (3) provide a facility for evaluating fuels, free of vendor bias for use in the - energy industry. Five coals were test-burned in the 1-MWth unit: North Dakota and Asian lignites, a Wyoming subbituminous, and Colorado and Pennsylvania bituminous coats. A total of 54 steady-state test periods were conducted, with the key test parameters being the average combustor temperature, excess air, superficial gas velocity, calcium-to-sulfur molar ratio, and the primary air-to-secondary air split. The capture for a coal fired in a CFBC is primarily dependent upon the total alkali-to-sulfur ratio. The required alkali-to ratio for 90% sulfur retention ranged from 1.4 to 4.9, depending upon coal type. While an alkali-to-ratio of 4.9 was required to meet 90% sulfur retention for the Salt Creek coal versus 1.4 for the Asian lignite, the total amount of sorbent addition required is much less for the Salt Creek coal, 4.2 pound sorbent per million Btu coal input, versus 62 pound/million Btu for the Asian lignite. The bituminous coals tested show optimal capture at combustor temperatures of approximately 1550°F, with low-rank coals having optimal sulfur capture approximately 100°F lower.

22755 (DOE/MC/23166–3320) **Advanced coal-fueled industrial cogeneration gas turbine system: Annual report, June 1991–June 1992.** LeCren, R.T.; Cowell, L.H.; Galica, M.A.; Stephenson, M.D.; When, C.S. Solar Turbines, Inc., San Diego, CA (United States). Jun 1992. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-86MC23166. Order Number DE93000256. Source: OSTI; NTIS; GPO Dep.

This report covers the activity during the period from 2 June 1991 to 1 June 1992. The major areas of work include: the combustor sub-scale and full size testing, cleanup, coal fuel specification and processing, the Hot End Simulation rig and design of the engine parts required for use with the coal-fueled combustor island. To date Solar has demonstrated: Stable and efficient combustion burning coal-water mixtures using the Two Stage Slagging Combustor; Molten slag removal of over 97% using the slagging primary and the particulate removal impact separator; and on-site preparation of CWM is feasible. During the past year the following tasks were completed: The feasibility of on-site CWM preparation was demonstrated on the subscale TSSC. A water-cooled impactor was evaluated on the subscale TSSC; three tests were completed on the full size TSSC, the last one incorporating the PRIS; a total of 27 hours of operation on CWM at design temperature were accumulated using candle filters supplied by Refraction through Industrial Pump & Filter; a target fuel specification was established and a fuel cost model developed which can identify sensitivities of specification parameters; analyses of the effects of slag on refractory materials were conducted; and modifications continued on the Hot End Simulation Rig to allow extended test times.

22756 (DOE/MC/24132–93/C0187) **Tidd PFBC Demonstration Plant operation and testing.** Marrocco, M.; Hafer, D.R. American Electric Power Service Corp., Columbus, OH (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-87MC24132. (CONF-9303154–1: Air and waste water management seminar, New Orleans, LA (United States), 9-12 Mar 1993). Order Number DE93012830. Source: OSTI; NTIS; GPO Dep.

The Tidd PFBC Demonstration Plant, located in Brilliant, Ohio, is in its third year of operation and testing. The plant has achieved many of its original performance goals and test objectives; however, current emissions standards and the projected performance of competing technologies have caused a reassessment of the program goals. This paper provides a review of PFBC technology and discusses project goals and milestones achieved. Emphasis is placed on environmental performance and on projected modifications to be undertaken to improve sulfur capture and reduce calcium/sulfur molar ratio. A large-scale hot gas clean up demonstration is also in progress at Tidd. The demonstration has been providing information on ceramic barrier filter technology since its commissioning in October 1992. The Tidd Plant has met both its performance guarantees for emissions and its environmental permit limits. However, the tightening of government environmental standards and the projected performance of competing technologies have required a reassessment of the goals of AEP's PFBC program. Efforts are focusing on achieving better environmental performance, particularly with respect to sulfur capture and sorbent utilization.

22757 (DOE/MC/24132–3359) **Tidd PFBC Demonstration Project fourth quarterly technical progress report, CY 1992.** American Electric Power Service Corp., Columbus, OH (United States). Jan 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-87MC24132. Order Number DE93014529. Source: OSTI; NTIS; GPO Dep.

This is the 23rd technical progress report submitted to the Department of Energy in connection with the cooperative agreement between the DOE and the Ohio Power Company for the Tidd PFBC Demonstration Plant. This report covers the period from October 1, 1992 to December 31, 1992. Major activities during this period involve: (1) The unit was operated for a total of 714 hours (including gas turbine air prewarming). There were seven gas turbine starts, seven bed preheater starts, and seven operating periods with coal fire. The peak gross output of 64 MWH was achieved for the period of 1000 to 1100 hours on November 23, 1992. The longest coal fire was 285 hours beginning at 1211 hours on November 25, 1992. (2) Total gross generation was 24,643, and coal consumption was 11,900 tons. (3) The hot gas clean up system was commissioned. (4) Active end fluidization system to address sparge duct cracking and deformation problem was jointly initiated by ABB carbon, B&W and AEPSC. (5) All testing continued using Plum Run dolomite. This approach was taken as a conservative means to avoid sintering and unit trips which were encountered during the previous two start-ups in September using limestone and (6) monitoring of solid, liquid and gaseous waste streams, as detailed in the operations phase monitoring requirements in the EMP, were performed.

22758 (DOE/MC/24258–3362) **Testing of electrostatic agglomerator: Second quarterly report, May–July 1988.** Quimby, J. Cottrell Environmental Sciences, Somerville, NJ (United States). [1988]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC24258. Order Number DE93013993. Source: OSTI; NTIS; GPO Dep.

The ESA combustor has been redesigned for higher thermal inputs to alleviate problems due to poor CWM atomization, poor mixing, low Reynolds numbers, long ESA heatup times and high heat losses. A thermal analysis of the ESA has been made in order to estimate heatup times. Precipitator designs have been completed.

22759 (DOE/MC/25048–3102) **Collaborative research on fluidization employing computer-aided particle tracking: Final report.** Chen, M.M. Illinois Univ., Urbana, IL (United States). Dept. of Mechanical and Industrial Engineering. Apr 1993. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-88MC25048. Order Number DE93000274. Source: OSTI; NTIS; GPO Dep.

Discussions presented in this report highlight all the important considerations for making particle dynamics measurements using the radioactive active particle tracking methodology. It is seen that the technique makes it possible to obtain data which are not accessible by any other means. Among the advantages of the methods are: (1) It is completely uninvasive, and hence cannot disturb the flow. (2) It can penetrate opaque suspensions. (3) It yields detailed, spatially resolved (subject to resolution limitations) data on mean velocity and density distributions as well as other statistical quantities. Its disadvantages are: (1) It can only provide time averaged data. It cannot provide instantaneous "snap shots" of the flow field. (2) It cannot yield information of flows around bubbles, which are of great interest in fluidization theories. (3) It has only modest resolution – of the order of a two to four percent of the flow field. However, the resolution can be improved by almost an order of magnitude, if long test runs can be used to acquire data of high statistical quality. 4. For data of adequate resolution, long test runs – several hours and up - are needed. Clearly if used with a clear understanding of its capabilities as well as limitations,

the radioactive particle tracking technique can make possible measurements which are not possible by any other method, and contribute significantly to the study of suspension flows.

22760 (DOE/MC/27364–93/C0186) **Process performance of Ahlstrom Pyroflow PCFB pilot plant.** Sellakumar, K.M. (R&D Center, Ahlstrom Pyropower, Inc., San Diego, CA (United States)); Isaksson, J.; Tiensuu, J. Midwest Power, Des Moines, IA (United States). May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC27364. (CONF-930521–7: 12. international conference on fluidized-bed combustion, San Diego, CA (United States), 8-13 May 1993). Order Number DE93011584. Source: OSTI; NTIS; GPO Dep.

Ahlstrom Pyropower has designed and built a 10 MW_{th} (34 MMBtu) pressurized circulating fluidized bed (PCFB) pilot plant in Karhula, Finland. The unit is now operating. Data from this unit supports the design of a nominal 80 MW, Des Moines Energy Center 1 (DMEC-1) PCFB Repowering Project. The pilot plant PCFB combustor is of square cross-section. It is housed in a 3.6 m (11.8 ft) diameter pressure vessel. A high pressure high temperature gas cleaning unit downstream of the PCFB exhaust is installed in a separate 2.6 m (8.5 ft) diameter pressure vessel. The maximum plant operating pressure is 16 bar (232 psia). The fuel is fed in slurry form; sorbent is also fed along with the fuel. The net heat input per unit cross section of the combustor is the highest of any known combustion mode. The heat release can go up to 40 MW/m^2 (12.6 MMBtu/ft^2 hr). Many types of coals including high sulfur, bituminous Illinois No. 6 coal and Western sub bituminous, low sulfur Powder River Basin coal were tested. Combustion efficiencies in the range of 99.5 to 99.9% have been consistently observed. Emissions of various gases such as NO_x SO_2 and CO at different operating pressures and loads were monitored. The gas emissions have been lower than expected based on atmospheric circulating fluidized bed boiler experience. The sulfur retention is over 95 % with a Ca/S molar ratio of 1 to 2 for high sulfur Illinois No.6 coal. A GAVS molar ratio of 2.5 to 3.5 was observed to retain 95 % of sulfur with low sulfur Powder River Basin coal. All gaseous emissions during testing with Illinois No. 6 coal and Powder River Basin coal are well within the projected limits for the DMEC1 project. Emission data from tests with Illinois No. 6 coal and Powder River Basin coal are presented in the paper.

22761 (DOE/METC/C–93/7062) **Second-generation pressurized fluidized bed combustion plants for electric power generation.** Robertson, A. (Foster Wheeler Development Corp., Livingston, NJ (United States)); Bonk, D.; Horazak, D.; Newby, R.; Rehmat, A. USDOE Morgantown Energy Technology Center, WV (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). (CONF-921115–1: 5. international power generation industries conference and exposition, Orlando, FL (United States), 17-19 Nov 1992). Order Number DE93011586. Source: OSTI; NTIS; GPO Dep.

In the search for a more efficient, less costly, and more environmentally responsible method for generating electrical power from coal, research and development has turned to advanced pressurized fluidized bed combustion (PFBC) and coal gasification technologies. A logical extension of this work is the second-generation PFBC plant, which incorporates key components of each of these technologies. In this new type of plant, coal is devolatilized/carbonized before it is injected into the PFB combustor bed, and the low-Btu fuel gas produced by this process is burned in a gas turbine topping combustor. By integrating coal carbonization with PFB°C (2300°F) and higher can be achieved. When integrated with a conventional 16.5-MPa gage/538°C/538°C/8.5-kPa Hg (2400- psig/1000°F/1000°F/2.5-in. Hg) steam cycle, a plant electrical generating efficiency of 45-percent is predicted. Concomitant advantages, among others, are a 20-percent lower cost of electricity (compared with a conventional pulverized-coal-fired plant with stack gas scrubbing), reduced stack emissions, and components that can be shipped by barge. This paper presents a conceptual design and economic analysis of Pittsburgh No. 8 and Texas lignite coal-fired 500-MWe second-generation PFB combustion plants.

22762 (DOE/PC/79660–T10) **Development of a vortex combustor (VC) for space/water heating applications (combustion tests): Final report.** Fu, T.T. (Naval Civil Engineering Lab., Port Hueneme, CA (United States)); Nieh, S. Naval Civil Engineering Lab., Port Hueneme, CA (United States). Nov 1990. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI22-87PC79660. Order Number DE93013059. Source: OSTI; NTIS; GPO Dep.

This is the final report for Interagency Agreement DE-AI22-87PC79660 on "Combustion Test" for vortex combustor (VC) development for commercial applications. The work culminated in the successful demonstration of a 2 MB/H proof-of-concept (POC) model firing coal-water fuel (CWF). This development is concerned with a new concept in combustion, and was a general lack of relevant information. The work therefore began (in addition to the companion cold flow modeling study) with the design and test of two subscale models (0.15 and 0.3 MB/H) and one full scale model (3 MB/H) to obtain the needed information. With the experience gained, the 2 MB/H POC model was then designed and demonstrated. Although, these models were designed somewhat differently from one another, they all performed well and demonstrated the superiority of the concept. In summary, test results have shown that VC can be fired on several coal fuels (CWF, dry ultrafine coal, utility grind pulverized coal) at high combustion efficiency (>99%), high firing intensity (up to 0.44 MB/H-ft^3), and at temperatures sufficiently low or dry ash removal. The combustion process is completed totally inside the combustor. Conventional combustion enhancement techniques such as: preheating (air and/or fuel), pre-combustion, and post combustion are not needed.

22763 (DOE/PC/90310–T11) **Combustion of dense streams of coal particles: Quarterly progress report No. 10, November 29, 1992–February 28, 1993.** Annamalai, K. Texas A and M Univ., College Station, TX (United States). Dept. of Mechanical Engineering. 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90310. Order Number DE93014943. Source: OSTI; NTIS; GPO Dep.

This progress report defines Tasks For November 29, 1992 to February 28, 1993. Continue the parametric experiments on stream combustion: (i) cloud denseness, (ii) particle size, (iii) gas temperature, (iv) residence time, and (v) oxygen concentration. Mr. Gopalakrishnan is expected to defend his MS Thesis by May 1993. The MS Thesis of Mr.Gopalakrishnan and a part of the Ph.D Thesis of Mr. Du and Dr. William Ryan will constitute the final report on the project. Activities During November 29, 1992 to February 28, 1993. Attempts have been made on direct measurement of the velocity of particles using imaging technology (Appendix A). The status of the tasks is given in Table I (Appendix B). The effects of cloud denseness (A:F ratio in the stream) and residence time (zone height) on the burnt fraction are given in Figures 1 and 2 (Appendix B). The A:F ratio of 1:1 is equivalent to 7×10^9 particle per m^3 or ℓ/a = 16. Detailed video-images have been obtained which are expected to yield the luminosity contours and stream diameters. However, analyses of the images have not yet been completed. The computer code for combustion of spherical clouds has been used to model the combustion of a large porous coal particle because of the strong analogy between the combustion of clouds and a porous coal particle. The model was first used for generating results on heterogeneous and homogeneous ignition of coal particles assuming uniform particle temperature. The transient results indicate heterogeneous ignition first followed by homogeneous ignition and combustion at later times. Large particle starts with homogeneous ignition. Further transient results differ from quasi-steady results of Wall, et al of Australia.

22764 (DOE/PC/90547–T10) **Evaluation of gas-reburning and low NO_x burners on a wall fired boiler: Technical progress report No. 10, January 1–March 31, 1993.** Energy and Environmental Research Corp., Irvine, CA (United States). 15 Apr 1993. 16p. Sponsored by USDOE, Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Gas Research Inst., Chicago, IL (United States). DOE Contract FC22-91PC90547. Order Number DE93014514. Source: OSTI; NTIS; GPO Dep.

Clean Coal Technology (CCT) implies the use of coal in an environmentally acceptable manner. Coal combustion results in the emission of oxides of nitrogen (NO_x), which are precursors of both

acid rainand ozone formation. The primary objective of this CCT project is to evaluate the use of Gas Reburning and Low NO_x Burners (GR-LNB) for NO_x emission control from a wall fired boiler. It is anticipated that, if the demonstration is successful, the GR-LNB technology could become commercialized during the 1990's and will be capable of (1) achieving significant reduction in the emissions of nitrogen oxides and sulfur dioxide (another acid rain precursor) from existing facilities to minimize environmental impacts such as transboundary and interstate pollution and/or (2) providing for future energy needs in an environmentally acceptable manner. Low NO_x burners are designed to delay the mixing of the coal fuel with combustion air to minimize the NO_x formation. Typically, one may obtain up to 50% reduction in NO_x emissions through the use of LNB. For LNB applications, the technology is developed and a number of LNB designs are commercially available. With GR, about 80–85 percent of the coal fuel is fired in the main combustion zone. The balance of the fuel is added downstream as natural gas to create a slightly fuel rich environment in which NO_x, is converted to N_2. The combustion process is completed by over-fire air addition. SO_x emissions are reduced to the extent that natural gas replaces sulfur-containing coal. The level of NO_x reduction achievable with 15–20% natural gas is on the order of 50–60 %. Thus the emission reduction target of the combination of these two developed technologies is about 75%.

22765 (DOE/PC/91284–2) **Nitration of polynuclear aromatic hydrocarbons in coal combustors and exhaust streams: Quarterly report, January 1, 1992–March 31, 1992.** Yu, L.; Dadamio, J.; Hildemann, L.; Niska, S. Source: OSTI; NTIS; GPO Dep.

Regarding PAH preparation, our efforts this quarter were directed at identifying the operating conditions in the laboratory furnace that clearly resolve primary devolatilization from secondary pyrolysis. In previous studies, pristine tars from primary devolatilization were prepared in the radiant coal flow experiment with a furnace length of only 5 cm. Tars at various extents of secondary pyrolysis were generated in a hot-zone of 12.5 cm. For this project we decided to try to prepare both kinds of PAH in the 12.5 cm hot zone. Preliminary screening surveys showed that, among the dime possible ways to compensate for the longer furnace tube, only lowering the fumace temperature is really effective. Lowering the loading from its already low value of 300 No./cm^3 is inconsequential, and raising the gas velocity to lower residence times in the longer hot zones causes deposition problems. The coal jet undergoes the transition to turbulence in less than 12 cm for entrainment velocities greater than 1 cm/s. By the end of the quarter, it was clear that the best value for primary devolatilization studies will fall within the range of 1 150 to 1400 K. But at present we are still not completely satisfied with the resolution of primary devolatilization. As intended, the tars collected at short residence times are completely soluble in tetrahydrofuran (THF), indicating that no soot is present so no secondary pyrolysis has occurred. But at residence times long enough to attain ultimate primary devolatilization yields, some soot is present. We will make our final choice early in the next quarter, then begin to collect an inventory of primary devoatilization tars for subsequent detailed characterization.

22766 (DOE/PC/91292–T6) **Rheological properties essential for the atomization of coal water slurries (CWS): Quarterly progress report, December 15, 1992–March 15, 1993.** Ohene, F. Grambling State Univ., LA (United States). Dept. of Chemistry. 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91292. Order Number DE93014516. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to perform experiments to understand the effect of high shear and extensional properties on the atomization of coal-water slurries (CWS). In the atomization studies, the mean drop size of the CWS sprays will be determined at various air-to CWS. A correlation between the extensional and high shear properties, particle size distributions and the atomization will be made in order to determine the influence of these parameters on the atomization of CWS. During this past quarter, an attempt was made to establish a theoretical relationship between the sauter mean diameter, (SMD), theAir/Fuel ratio and the viscosity. Also the effect of polymeric additives on the rheology of glycerol was studied.

22767 (DOE/PC/92521–T4) **Geochemistry of FBC waste-coal slurry solid mixtures: Technical report, December 1, 1992–February 28, 1993.** Dreher, G.B. (Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). Geological Survey); Roy, W.R.; Steele, J.D.; Heidari, M.; Banerjee, D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013622. Source: OSTI; NTIS; GPO Dep.

Three tasks are being conducted in this research project. All are related to understanding the chemistry and mineralogy of the co-disposal of fluidized bed combustion (FBC) wastes with coal slurry solid (CSS) from a coal preparation plant. During coal cleaning, pyrite and other heavy minerals and rock materials are rejected from the coal and discharged in an aqueous slurry to an impoundment. Soluble components and acid-base reaction products from mixtures of fluidized bed combustion (FBC) wastes and coal slurry solids (CSS) are being extracted in aqueous solution in a series of batch experiments. These experiments are being conducted in order to provide information on the solution chemistry associated with the mixtures over an extended time. Large volumes of extracts from three mixtures of FBC waste and CSS are being prepared for use in experiments to ascertain the adsorption/desorption reactions that occur between components of the extracts and three commonly occurring Illinois soils. A computer program that simulates the effects of pyrite oxidation and acid neutralization in a spoil heap is being corrected and improved.

22768 (DOE/PC/92548–T1) **Suppression of fine ash formation in pulverized coal flames: Quarterly technical progress report No. 2, January 1, 1993–March 31, 1993.** Kramlich, J.C.; Hoffman, D.A.; Butcher, E.K. Washington Univ., Seattle, WA (United States). Dept. of Mechanical Engineering. 29 Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92548. Order Number DE93015053. Source: OSTI; NTIS; GPO Dep.

The second major ash producing mechanism is the generation of a submicron aerosol through a vaporization/condensation mechanism. When the ash size distribution is plotted in terms of number density, the submicron mode generally peaks at about 0. 1 μm. When plotted in terms of mass, this mode is sometimes distinct from the residual ash mode, and sometimes merged into it. During diffusion-limited char combustion, the interior of the particle becomes hot and fuel-rich. The non-volatile oxides (e.g., Al_2O_3, SiO_2, MgO, CaO, Fe_2O_3) can be reduced to more volatile suboxides and elements, and partially vaporized. These reoxidize while passing through the boundary layer surrounding the char particle, thus becoming so highly supersaturated that rapid homogeneous nucleation occurs. This high nuclei concentration in the boundary layer promotes more extensive coagulation than would occur if the nuclei were uniformly distributed across the flow field. The vaporization can be accelerated by the overshoot of the char temperature beyond the local gas temperature. Although these particles represent a relatively small fraction of the mass, they can present a large fraction of the surface area. Thus, they are a preferred site for the condensation of the more volatile oxides later in the furnace. This leads to a layering effect in which the refractory oxides are concentrated at the particle core and the more volatile oxides resideat the surface. This also explains the enrichment of the aerosol by volatile oxides that has been noted in samples from practical furnaces. These volatile metal oxides include the majority of the toxic metal contaminants, e.g., mercury, arsenic, selenium and nickel. Risk assessment studies suggest that toxic metal emissions represent a significant portion of the health risk associated with combustion systems.

22769 (DOE/PC–93007525, pp. 12-17) **Encouraging partnerships: Cooperative research and development agreements between government and industry.** USDOE Pittsburgh Energy Technology Center, PA (United States). 1993. In *PETC Review: Issue 7, Winter 1992–1993.* 52p. Order Number DE93007525. Source: OSTI; NTIS.

Projects that result from a Cooperative Research and Development Agreement (CRADA) are described. CRADA's are the result of legislation that gives Federal laboratories a mandate to work with the private sector in researching and developing new technologies. The history of CRADA goes back to the Stevenson-Wydler Technology Innovation Act of 1980. This was an effort by Congress to encourage Federal laboratories to transfer their technology to the private sector. The legislation addressed the need to create centers for industrial technology and promoted the idea of working with private industry to share value Government processes and inventors. The benefits of CRADA's at the Pittsburgh Energy Technology Center are discussed.

22770 (KTM/E-B–127) **Combustion and gasification: Master plan for an energy technology research programme 1993-1998.** Hupa, M. (Aabo Akademi, Turku (Finland)). Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. 1993. 43p. (In Finnish). Project KTM-315/881/92. Order Number DE93794853. Source: OSTI; NTIS.

LIEKKI 2 Research Programme.

Liekki 2 is largely to continue that combustion and gasification programs Liekki and Jalo. The program contains applied short-term research as well as more fundamental, long-term basic research. The applied research for immediate use is to be focused, among other things, on issues concerning pressurized fluidized techniques, especially the cleaning of the product gases resulting from pressurized combustion and gasification. Research concerning the control of emissions from large diesel engines is also central. Studies involving emissions from waste incineration will be included, too. The long-term, more basic research is not directly concerned with the development of existing plants and equipment or concepts, but adds to the general knowledge on phenomena related to combustion processes. Among other things, the program will include projects for mathematical modelling of combustion and furnaces. Some of the interesting issues are the description of suspension flow, chemical reactions under turbulent flow, and incorporating the emission chemistry into the flow calculations. Using suitable, accurately controlled laboratory equipment, partial processes such as fuel behavior at combustion, gasification, and pyrolysis under different conditions will be studied. The effect of pressure on these processes, in particular, needs further clarification. Interesting open questions concerning the chemistry of emission formation still remain. The studies under way examining the chemistry of nitrogen and sulfur compounds are worth continuing; also studying the chemistry such as that of chlorine compounds will be of interest in the future. Moreover, the behavior of ash, especially under reductive conditions, is interesting.

0150 Economic, Industrial, and Business Aspects

22771 (ETDE/JP-mf–93793769) **Australian coals expected of real cost competitive edge.: Through comparing them with U.S. coals.** Institute of Energy Economics, Tokyo (Japan). 20 Oct 1992. 31p. (In Japanese). Order Number DE93793769. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

Discussions were given on the future supply reliability in Australian coals exported in the largest quantity in the world. The world coal demand is growing steadily, but the supply power is outgrowing the demand resulting in stagnated coal prices. Australian coals are sold domestically at 29% and exported at 71%, being strongly affected with the international market in the supply amount and price aspects. The world's coal markets transact coals in the U.S. dollar based prices, hence the exchange rates affect largely revenues from the sales. The Australian dollar has been in a trend of depreciation against the U.S. dollar during the period from 1970 through 1990, and the mining companies have been enjoying its benefit, which in reverse is a fragile structure for the Australian dollar appreciation. The coal productivity has grown from 1.8 tons/man/hour to 2.5 tons/man/hour during 1980 through 1985, approximately equivalent to that in the U.S.A. However, in 1990, the productivity was 3.1 tons in Australia while it was 3.5 tons in the U.S.A. The annual wage rise rate in Australia is 10.1%, causing a concern about increased coal mining cost. 36 figs., 11 tabs.

0160 Health and Safety

22773 (CONF-921275–, pp. 43-44) **Tracing by a member of the rescue party at Mitsui Miike Coal Mine.: Mainly on coal dust explosion and CO poisoning disaster at Mikawa Coal Mine.** Tsuji, N. (Ariake National College of Technology, Fukuoka (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

The paper describes activities and roles of the rescue party in the past accidents and disasters at Miike Coal Mine, particularly looking back on rescue work by Mr. S. T. who was a member of the rescue party in explosion accidents at Yamano Mine and Mikawa Mine. As for conditions and selection of the members of the rescue party, a person appropriate mentally and physically is selected and arranged for each mine and each section. Dismissal is based on the person's wish, slight unusuality of health, and age (45 years old). The member receives lectures at the Kyushu security center, obtains certification, and then works. There are such rules that the member receives training once a month, his allowance is changeable according to the degree of danger of the operation, etc. On June 1, 1965, an accident of methane gas explosion happened in which 27 persons were killed and 29 persons were poisoned by CO. Also, in November 1963, at Mikawa Mine, a coal tub cut a high-voltage cable and the spark ignited coal dust, which caused a big explosion. By roof fall and a flood, 458 and 839 persons were killed and CO poisoned, respectively. He was sent to the scene of those accidents. 3 refs., 3 figs.

22774 (CONF-921275–, pp. 57-60) **Fire and explosion hazards with powdered coal. 1.: Its heat generating and spontaneous ignition characteristics.** Itagaki, H. (Research Institute of Industrial Safety, Tokyo (Japan)); Matsuda, T.; Morisaki, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Coals have different degrees of heat generation and carbonization depending on types. With an objective to prevent explosive fires, this paper describes tests on different types of powdered coal (eight types with volatiles at from 5% to 44%) for their spontaneous igniting and dust explosion characteristics. The tests included thermal analyses using DTA, DSC and TG measurements, a heat insulation test using an accelerating rate calorimeter (ARC), and a spontaneous ignition test using an infrared heating device. Although specificity was observed in the relation between temperature and spontaneous heat generating rate depending on the coal types in the heat insulation test, the more the volatiles, the heat generation starting temperature decreased on the whole, and its curves did not change much even if the atmospheric condition was varied. In the infrared heating test, the critical temperature in spontaneous ignition showed a trend of decrease when deposition thickness in the test pieces increased. Reducing the deposition thickness was more effective in reducing the maximum ultimate temperature at the center of a test piece than by reducing the heating temperature. 8 figs., 2 tabs.

22775 (CONF-921275–, pp. 61-64) **Fire and explosion hazards with powdered coal. 2.: Coal dust explosion characteristics.** Matsuda, T. (Research Institute of Industrial Safety, Tokyo (Japan)); Itagaki, H.; Morisaki, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu

(Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Different methods for measuring coal dust explosion characteristics have been developed for ignition and explosion of coal dust associated with utilization of powdered coal. With an objective of establishing a more reasonable method for evaluating hazards thereof, this paper describes discussions on explosion hazard property values using pieces of explosion testing equipment that use from small to large containers. Three types of dust explosion testing equipment were used to measure explosion hazards in nine types of coal dust. The following results were obtained: An electric spark ignition source in a blow-up type testing equipment does not work sufficiently for dusts with relatively weak explosiveness; the maximum explosion pressure measured using a 1-m^3 testing equipment exhibited equivalent data to those with a 30-liter testing equipment, but the maximum explosion pressure rising rate was lower than that with the latter equipment; coal dust with less volatiles does not explode in this equipment; the 30-liter testing equipment tended to somewhat overestimate the explosion hazards, while the 1-m^3 testing equipment was thought to provide more practical data; and the lower explosion concentration limit and the oxygen concentration limit are relevant with the amount of volatiles. 5 refs., 7 figs.

Specific goals and accomplishments of this research include: (1) The evaluation of models of salt diaper ascent that involve either power law, dislocation creep as determined experimentally by Horseman et al. (1993) or linear, fluid-assisted creep as reported by Spiers et al. (1988, 1990, 1992). We have compared models assuming these two, experimentally evaluated flow laws and examined the predictions they make regarding diaper incubation periods, ascent velocities, deviatoric stresses and strain rates. (2) The evaluation of the effects of differential loading on the initiation an of salt structures. (3) Examination of the role of basement faults on the initiation and morphologic evolution of salt structures. (4) Evaluation of the mechanical properties of shale as a function of pressure and determination of the nature of its brittle-ductile transition. (5) Evaluation of the mechanical anisotropies of shales with varying concentrations, distributions and preferred orientations of clay. (6) The determination of temperature and ratedependencies of strength for a shale constitutive model that can be used in numerical models that depend on viscous formulations. (7) Determination of the mechanisms of deformation for argillaceous rocks over awide range of conditions. (8) Evaluation of the effects of H_2O within clay interlayers, as adsorbed surface layers.

22779 (ETDE/JP-mf–93794512, pp. 79-89) **Surface geochemical prospecting.: Development for marine geochemical survey system.** Takayama, K.; Shimada, T.; Ishida, K.; Fujii, J.; Matsui, H. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

This paper reports the results obtained during 1991 of the study on surface geochemical prospecting having been carried out by the Technology Research Center of Japan National Oil Company as one of its research operations. This study is intended to develop a technology to discover promising minable areas or detect oil beds by means of detecting trace amount of hydrocarbon gas oozing out from underground oil beds. Therefore, the study moves developments forward in systems to detect continuously trace amount gas from ocean surface and continuous trace amount gas analyzing devices, as well as discusses methods to analyze geochemical abnormalities. In developing the continuous detecting systems during 1991, a prototype towed continuous water collector was fabricated that is equipped with a device to collect continuously sea water sample for analyzing the trace amount of gas and sensors to observe sea water properties. Improvements have been given on filters for continuous degassing and analyzing devices. Further, marine experiments were conducted on the sea water area off Honjo, Akita Prefecture to verify these systems. 8 figs., 2 tabs.

22780 (ETDE/JP-mf–93794512, pp. 113-118) **Development of geophysical exploration methods for areas with complex topography and geology.: Seismic methods.** Watanabe, K.; Koike, K.; Kano, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

This paper describes studies being carried out to establish physical exploration methods effective for areas where making physical petroleum prospecting is difficult. This paper is a report on the results obtained during 1991 of the studies on seismic exploration technologies that have been continuing since 1987. The fiscal year 1991 saw preliminary and full-scale experiments on methods to bury oscillation receivers. The experiments carried out at the Teradomari and Wajima Village areas in Niigata Prefecture were unable to trace ground bed boundaries because of complex geological structures in the mountainous area causing poor continuity in the reflection faces during a seismic exploration, hence no meaningful data were obtained. To avoid this, preliminary experiments were performed to bury oscillation receivers in different depths down to 30 meters. As a result, burying them at depths greater than the thickness of the surface bed provided a possibility of obtaining high-resolution data. Full-scale experiments were then

conducted in adjacent areas on 120 oscillation receiving points at a depth of 20 meters. The results were not necessarily as good as those with surface oscillation receivers both in resolutions and S/N ratio, but a number of finding were derived in association with the data. 6 figs.

22781 (ETDE/JP-mf–93794512, pp. 119-124) **Development of geophysical exploration methods for areas with complex topography and geology.: Electromagnetic methods.** Takeda, H.; Shiga, N.; Kano, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

This paper describes studies being carried out to establish physical exploration methods effective for areas where making physical petroleum prospecting is difficult. This paper is a report on the results obtained during 1991 of the studies on electromagnetic exploration technologies that have been continuing since 1987. In the fiscal year 1991, a time-domain electromagnetic method (TDEM), one of the electromagnetic exploration technologies, was experimented on to verify its effectiveness on about 100 measuring points spaced in 500-m intervals at the Yasuda-Matsunoyama area in Niigata Prefecture where the seismic exploration data have been very poorly recorded. The signalling power supply electrode pairs were flown with square wave current at 161 A p-p. The conclusion obtained may be summarized as follows: Although noises were somewhat high in this survey area, possibly requiring part of the data to be re-processed and re-analyzed, the specific resistance distribution for down to about 5 km below the surface was derived; the specific resistance structure consists broadly of a three-layer structure comprising the surface, lower and higher beds with different specific resistances; and shapes of the boundary faces were recognized with a moderately inclining structure in the vicinity of the center of the boundaries. 7 figs.

Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Developments have begun since 1990 on methods to infer underground structures with high reliability by means of utilizing fully the underground information obtained from different physical exploration means. This is part of the efforts of developing geophysical exploration methods for ares with complex topography and geology in the large-size research project carried out by the Technology Development Center of Japan National Oil Corporation. In the fiscal year 1991, the case study performed in the previous year at the northern slope of Mt. Chokai was expanded to the extent where the seismic exploration results were compared with the results of integrated interpretation on the electromagnetic prospecting method and the specific resistance method. The comparison was made basically through the repetition of a cycle comprising a comparative discussion on images of underground structures obtained from different physical exploration methods, re-processing of individual physical exploration results followed by re-analysis, and a comparative discussion on modified images of underground structures. Inferences were given on underground structures that satisfy the comparison result as much as possible. It was possible, for example, to identify approximate specific resistance distribution down to a great underground depth with use of the electromagnetic exploration methods (consisting of three processes), and detailed specific resistance distribution at shallow depths with use of the specific resistance exploration method. These data were integrated to derive a two-dimensional specific resistance model. 1 ref., 6 figs.

This paper is a 1991 annual report on a research having been carried out since 1986 as a sub-theme in the large-scale research project 'geophysical methods for exploring oil reservoir structures'. The research is to develop technologies to identify patterns and distribution of oil-gas reservoirs and infer reservoir rock characteristics including porosities using a high-resolution three-dimensional seismic exploration method. In 1991, investigations were carried out on the relation between reservoir rock characteristics and acoustic impedance using the Amarume oil field in Yamagata Prefecture as an experimental field. Based on the analysis of bed inspection data using research wells, the relation between characteristics of different reservoir rocks and acoustic impedance or velocity was discussed. Among the B1 sand bed, the upper B2 sand bed and the lower B2 sand bed, a best correlation was recorded at the B2 sand bed between the acoustic impedance and the effective porosity. When a multi variables linear regression method was used that is added with contents of clay and shale as correction terms, the correlation coefficient was 0.9 to 0.95. On the other hand, a finding was obtained that the correlation coefficient varies greatly depending on whether the pores are filled with gas or oil. 13 figs., 1 tab.

(In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

With objectives of collecting and accumulating environmental data in the arctic region and establishing their data base, a research has been carried out over a period from 1990 to 1993 fiscal years as one of the continuing researches at the Petroleum Development Technology Center. This paper is a report on the results obtained during the fiscal 1991. Subsequent to the basic surveys and data base concept designs performed in the previous year, the year 1991 saw the Center's participation in two scientific societies and one joint survey to collect related information. Out of the subjected 24 sea areas, 19 areas were surveyed to collect environmental data. The data consist of about 20 items including meteorological, hydrographical, cryogenic, and oceanogeological data. The data comprise mainly statistical data, with their reliability investigated at the same time. The data base was discussed as to its subject users, hardwares and softwares as its operating environment. As a result, it was decided that the data base should be structured with relatively general purpose hardwares and softwares under an assumption that its major users are engineers at petroleum development companies. 5 figs., 3 tabs.

Modelling of a field in the Danish part of the North Sea. EFP-89.

An advanced three-dimensional finite element program, ABAQUS, has been implemented and used in a number of different connections at the Danish Gjeotechnical Institute. DGI also disposes over the requisite hardware capacity for calculations of rather detailed, spatial finite element models. This report illustrates by examples a selection of the possibilities of finite element simulation of the geological development as well as the development of the stress and strain conditions of an oil reservoir in the Danish part of the North Sea. One calculation was performed under completely drained conditions, i.e. pore pressure not taken into account. The calculation was carried through to the planned final state, simulating the development of the field for the last some 1.7 million years. Another calculation was performed based on consolidation theory, i.e. pore pressure taken into account. An initial state was produced by means of a partly executed calculation corresponding to the conditions some 1.7 million years ago. This initial state could be used for the continued final calculation. The main result of the calculations is a realistic stress/strain field in the simulated reservoir, being a useful starting point for simulating the future production potential to the field. (AB).

Denmark (Denmark)); Rasmussen, F.O. Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). [1992]. 9p. Contract ENS-1313/89-9. Order Number DE93794681. Source: OSTI; NTIS.

Modelling of a field in the Danish part of the North Sea. EFP-89.

A two-step method is described which enables the depositional history and the structural development to be simulated. The method is illustrated by simulation of a North Sea field containing a chalk reservoir with a large overpressure. The simulation is based on back-stripping techniques including decompaction calculations in which sediments are "unloaded" in successively older time steps. The first step involves 1D consolidation calculations in a number of wells in the area, implying coupling of compaction and flow of pore fluid. The compaction is solved by soil mechanics constitutive laws including time dependent deformations. These laws provide effective stresses, pore pressures, thicknesses and void ratios as functions of time. This makes it possible to model the behavior of overpressured shales. The computations are iterative forward modelling, and the results are compared to the present day situation. A decompaction factor is introduced. This factor describes the relative change of computed thickness for a given layer during a time interval. It is possible to include flow between the wells in a particular layer, such as a chalk reservoir, and thereby make the model partly three-dimensional. The decompaction factors for the wells can be interpolated, and thereby provide a field-wide description of the decompaction during each time interval. In the second step - the back-stripping - the decompaction factors are used instead of the traditional depth/porosity relations. In this way geotechnical methods are introduced into the back-stripping technique. At the Danish Geotechnical Institute (DGI) the results of this modelling has been used in calculations of two or three dimensional stress fields, fracture directions and intensity at different times. These computations are described in the companion paper by K. Petersen et al. "Natural stress field in a chalk reservoir predicted by spatial finite element analysis". (au).

Modelling of a field in the Danish part of the North Sea. EFP-89.

This paper exemplifies the potential of spatial finite element analysis to simulate the geological and stress/strain related development in an oil reservoir in Danish part of the North Sea. The basic depositional history and the structural development of the actual field was simulated numerically at the Geological Survey of Denmark (DGU). This simulation is described in the companion entitled paper by A. Olsen et al. "Numerical method to describe the deformation of chalk reservoirs". Based on the basic input from DGU two principly different elastic-plastic calculations are carried out. In the first calculation the excess pore pressure developing throughout the simulation of the depositional history is disregarded, i.e. the material behaviour is considered totally drained throughout the calculation. Conversely pore pressure development is fully accounted for in the other type of calculation, i.e. the material behaviour encompass consolidation theories in order to solve the coupled diffusion/equilibrium equations simultaneously. The latter calculation was unfortunately not carried through to the planned finale state, due to project specific hardware limitations. A main result of the calculations is a more realistic stress field compared to the up to now often applied stress field based on a straight forward at-rest condition (K_0-condition). Subsections of such an improved stress field could be used as an initial state for a simulated well production history in the actual field leading to a higher degree of efficiency in the evaluation of bore hole stability and fracturing in deviated wells. (au).

22788 (NEI-DK–1137) **Further development of a mathematical model to simulate fracturing in chalk reservoirs: Modelling in a field in the Danish part of the North Sea.** DGU Service report, 3. Olsen, A.; Mathiesen, A. Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1993. 44p. Contract ENS-1313/89-9. Order Number DE93794679. Source: OSTI; NTIS.

EFP-89.

A method enabling structural stress/strain to be simulated is illustrated in relation to a North Sea field containing a chalk reservoir with a significant amount of over-pressure. After defining geological and geometrical data, backstripping techniques include decompaction calculations involving one dimensional consolidation reckonings implying coupling of compaction and flow of pore fluid. This makes it possible to model the behaviour of over-pressured shales. A decompaction factor describes the relative change of computed thickness for a given layer during a time interval. Interpolation of these factors gives a field-wide description of decompaction during each time interval. In back-stripping the decompaction factors are used instead of traditional depth/porosity relations, enabling the excess pore pressure to be considered. Stress and strain related development is predicted in a three dimensional spatial finite time analysis. An elastic-plastic calculation including drained material behaviour showed very promising results. Another type of this calculation takes pore pressure development into account and encompasses consolidation theories. (AB).

22789 (NEI-DK–1164) **Concepts for offshore exploration on pack-ice areas - phase 2: Summary report.** Cowiconsult Raadgivende Ingenioerer A/S, Lyngby (Denmark); Dansk Hydraulisk Inst., Hoersholm (Denmark); Oedegaard og Danneskiold-Samsoee ApS, Copenhagen (Denmark); Britsurvey, Great Yarmouth (United Kingdom); Thyssen Nordseewerke GmbH, Emden (Germany). Feb 1993. [45p.] Contract ENS-1313/90-0014;Contract ENS-1313/91-0013;Contract CEC Order Number DE93794729. Source: OSTI; NTIS.

EFP-90; EFP-91.

The area offshore North-East-Greenland (NEGS) was selected as target area for the study because NEGS area includes the most attractive frontier basins for petroleum exploration in Greenland and the fact that the severe ice conditions reduces the accessability of the area to about 1 month a year in most of the area. The project is carried out using an icebreaking seismic vessel towing conventional seismic equipment. The actual seismic lines of the regional survey may deviate from the planned lines depending of local ice conditions. Alternative seismic concepts were investigated following the requirements that operations should be possible all year round, a detailed coverage of local areas should be possible and that data quality should match industry standard of conventional seismic operations. The main result is a new seismic concept including a seismic icebreaker with an onboard submarine designed by Thyssen Nordseewerke. The icebreaker may be used for gathering 3-D seismic when the ice conditions allow towing of the seismic array. The submarine can be launched for continuation in difficult ice conditions. Problems regarding towing the streamer from a submarine was studied. Ice conditions were investigated the concept for Sea Ice Information management was prepared. The quality of the seismic data was studied. A major part of the project address the many problems connected with the submarine operations. The Danish Navy has assisted with information of submarine operations and safety conditions. Problems connected with towing the seismic equipment were examined. (AB) (11 refs.).

22790 (DOE/BC/14246–11) **Microbial field pilot study: Final report.** Knapp, R.M.; McInerney, M.J.; Menzie, D.E.; Coates, J.D.; Chisholm, J.L. Oklahoma Univ., Norman, OK (United States). May 1993. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89BC14246. Order Number DE93000140. Source: OSTI; NTIS; GPO Dep.

A multi-well microbially enhanced oil recovery field pilot has been performed in the Southeast Vassar Vertz Sand Unit in Payne County, Oklahoma. The primary emphasis of the experiment was preferential plugging of high permeability zones for the purpose of improving waterflood sweep efficiency. Studies were performed to determine reservoir chemistry, ecology, and indigenous bacteria populations. Growth experiments were used to select a nutrient system compatible with the reservoir that encouraged growth of a group of indigenous nitrate-using bacteria and inhibit growth of

sulfate-reducing bacteria. A specific field pilot area behind an active line drive waterflood was selected. Surface facilities were designed and installed. Injection protocols of bulk nutrient materials were prepared to facilitate uniform distribution of nutrients within the pilot area. By the end of December, 1991, 82.5 tons (75.0 tonnes) of nutrients had been injected in the field. A tracer test identified significant heterogeneity in the SEVVSU and made it necessary to monitor additional production wells in the field. The tracer tests and changes in production behavior indicate the additional production wells monitored during the field trial were also affected. Eighty two and one half barrels (13.1 m^3) of tertiary oil have been recovered. Microbial activity has increased CO_2 content as indicated by increased alkalinity. A temporary rise in sulfide concentration was experienced. These indicate an active microbial community was generated in the field by the nutrient injection. Pilot area interwell pressure interference test results showed that significant permeability reduction occurred. The interwell permeabilities in the pilot area between the injector and the three pilot production wells were made more uniform which indicates a successful preferential plugging enhanced oil recovery project.

22791 (DOE/BC/14472–11) **Characterization of the gravity drainage phenomena through numerical and physical simulation.** Johnson, L.A. Jr.; Satchwell, R.M.; Mones, C.G.; Carlson, F.M. University of Wyoming Research Corp., Laramie, WY (United States). Western Research Inst. Oct 1992. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14472. (WRI–92-R051). Order Number DE93014191. Source: OSTI; NTIS; GPO Dep.

The gravity drainage mechanism is a contributor to primary, secondary, and tertiary oil production processes. In some cases, this mechanism is an insignificant contributor when compared to the other drive mechanisms. However, in depleted or shallow reservoirs, the gravity drainage mechanism may be the only producing mechanism. Several models have been developed to simulate the oil production processes. However, these previous modeling efforts have ignored the contribution from the gravity drainage mechanism. Therefore, these simulators are inaccurate in predicting the production rates when gravity drainage is the primary production mechanism. To predict the performance of the gravity drainage mechanism, a two part program of (1) developing an effective numerical simulator for the gravity drainage phenomenon and (2) conducting physical simulations to provide validation data for the model was undertaken. The first part of this report describes the physical simulations conducted to validate the numerical model. In the second part, the development and validation of the numerical simulator is presented. The developed.numerical simulator proved effective in evaluating fluid movement by gravity drainage. The model successfully simulated the cocurrent and countercurrent (phase segregation) movement of fluids and accurately portrayed capillary pressure effects. The implicit formulation of the model provided stable operation for all simulations performed in this study. Simulations can be made in one or three spatial dimensions. Full documentation of the simulator, a copy of the simulator code, a users guide, and an example case are provided.

22792 (DOE/BC/14657–12) **Measuring and predicting reservoir heterogeneity in complex deposystems: Quarterly technical report, January–March 1993.** Donaldson, A.C.; Shumaker, R.; Laughrey, C.; Aminian, K.; Hohn, M.E. Appalachian Oil and Natural Gas Research Consortium, Morgantown, WV (United States). 15 Apr 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14657. Order Number DE93014539. Source: OSTI; NTIS; GPO Dep.

This research is designed to use a multi-disciplinary approach to measure and map heterogeneity at various scales, and ultimately to develop tools and techniques to predict heterogeneity, both in existing fields and in undrilled areas. Two stratigraphic units have been chosen for this research: the Big Injun sandstone (Mississippian) in West Virginia, and the Rose Run Sandstone (Ordovician) in Ohio and Pennsylvania. Six milestones were scheduled for completions during the reporting period: comparing heterogeneity observed in cores with the anticipated deposystem interpretation; integration of structural and other interpretations; completing a final report on regional structure and the influence of structure on field formation; creation of the best seismic-derived geologic model; completing the thin section analysis of the Big Injun; and completing a study on well spacing. Four of these were completed on or ahead of schedule.

22793 (DOE/BC/14852–2) **Scale-up of miscible flood processes.** Orr, F.M. Jr. Stanford Univ., CA (United States). Dept. of Petroleum Engineering. [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92BC14852. Order Number DE93014533. Source: OSTI; NTIS; GPO Dep.

The current project is a systematic research effort aimed at quantifying the interactions of physical mechanisms that control the scaling behavior of miscible floods. Displacement performance in a miscible flood is the result of a complex set of competing and interacting mechanisms. Phase behavior is of fundamental importance because the transfer of components from the oil to the injected fluid (as in most CO_2 floods) or from the injected fluid to the oil (as in rich gas floods) can generate mixture compositions with displacement properties very different from those of pure CO_2 and original oil. The goal of this project, is to make more accurate quantitative predictions of the impact of nonuniform flow, crossflow and phase behavior in flows in heterogeneous reservoir rocks. In past reports, we have discussed the instabilities arising from unfavorable mobility ratios that occur during injection of a solvent such as CO_2. In this report, two-dimensional (2D) and three-dimensional (3D) computations by a particle-tracking technique are compared for unstable displacements in homogeneous porous media, with and without gravity. In homogeneous porous media without gravity, 2D fingering patterns and the length of the transition zone are nearly the same as those obtained in 3D displacements. When gravity is added, however, calculated gravity tongues and fingering patterns can be very different when viscous and gravity forces are of comparable magnitude. We summarize results obtained by Ph.D. student Hamdi Tchelepi concerning 2D and 3D fingering in homogeneous media, and we compare displacements with and without gravity segregation. The computations show conclusively that there are some situations in which 2D simulations reproduce 3D behavior well and others for which they do not.

22794 (DOE/BC/14860–1) **Detailed evaluation of the West Kiehl alkaline-surfactant-polymer field project and it's application to mature Minnelusa waterfloods: Technical progress report, January–March 1993.** Pitts, M.J. Surtek, Inc., Golden, CO (United States). 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14860. Order Number DE93014610. Source: OSTI; NTIS; GPO Dep.

The objective of this report is to (1) quantify the incremental oil produced from the West Kiehl alkaline-surfactant-polymer project by classical engineering and numerical simulation techniques,(2) to quantify the effect of chemical slug volume injection on incremental oil in the two swept areas of the field, (3) to determine the economic ramifications of the application of the alkaline-surfactant-polymer technology, (4) to forecast the results of injecting an alkaline-surfactant-polymer solution to mature waterfloods and polymer floods, and (5) to provide the basis for independent operators to book additional oil, reserves by using the alkaline-surfactant-polymer technology. This report document the initial geological and reservoir engineering data gathering. In addition, some of the initial laboratory results are discussed. Some evaluation of the West Kiehl has been published.

22795 (DOE/BC/14864–1) **Study of hydrocarbon miscible solvent slug injection process for improved recovery of heavy oil from Schrader Bluff Pool, Milne Point Unit, Alaska: [Quarterly] report, January 1, 1993–March 31, 1993.** Sharma, G.D. Alaska Univ., Fairbanks, AK (United States). Petroleum Development Lab. 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14864. Order Number DE93014608. Source: OSTI; NTIS; GPO Dep.

The ultimate objective of this three-year research project is to evaluate the performance of the hydrocarbon miscible solvent slug process and to assess the feasibility of this process for improving recovery of heavy oil from Schrader Bluff reservoir. This will be accomplished through measurement of PVT and fluid properties of Schrader Bluff oil, determination of phase behavior of Schrader Bluff oil solvent mixtures, asphaltene precipitation tests, slim tube

displacement tests, core flood experiments and reservoir simulation studies. The expected results from this project include: determination of optimum hydrocarbon solvent composition suitable for hydrocarbon miscible solvent slug displacement process, optimum slug sizes of solvent needed, solvent recovery factor, solvent requirements, extent and timing of solvent recycle, displacement and sweep efficiency to be achieved and oil recovery. Work performed during quarter includes preliminary reservoir fluid characterization and multiple contact test runs using equation-of-state (EOS) simulator. Reservoir fluid samples are being acquired from Conoco Inc., and the process is expected to continue through the next quarter. Also, the experimental apparatus for the displacement study was set up.

22796 (DOE/BC/14881–2) **Improving reservoir conformance using gelled polymer systems: Second quarterly report, December 25, 1992–March 24, 1993.** Green, D.W.; Willhite, G.P. Kansas Univ., Lawrence, KS (United States). 9 Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14881. Order Number DE93014532. Source: OSTI; NTIS; GPO Dep.

The general objectives are to (1) to identify and develop gelled polymer systems which have potential to improve reservoir conformance of fluid displacement processes, (2) to determine the performance of these systems in bulk and in porous media, and (3) to develop methods to predict the capability of these systems to recover oil from petroleum reservoirs. This work focuses on three types of gel systems - an aqueous polysaccharide (KUSPI) system that gels as a function of pH, the chromium-based system where polyacrylamide and xanthan are crosslinked by CR(III) and an organic crosslinked system. Development of the KUSPI system and evaluation and identification of a suitable organic crosslinked system will be done. The laboratory research is directed at the fundamental understanding of the physics and chemistry of the gelation process in bulk form and in porous media. This knowledge will be used to develop conceptual and mathematical models of the gelation process. Mathematical models will then be extended to predict the performance of gelled polymer treatments in oil reservoirs. Accomplishments for this period are presented for the following tasks: development and selection of gelled polymer systems, physical and chemical characterization of gel systems; and mathematical modeling of gel systems.

22797 (DOE/BC/14882–2) **Responsive copolymers for enhanced petroleum recovery: Quarterly technical progress report, December 22, 1992–March 21, 1993.** Hester, R.; McCormick, C. University of Southern Mississippi, Hattiesburg, MS (United States). Dept. of Polymer Science. 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14882. Order Number DE93014531. Source: OSTI; NTIS; GPO Dep.

The overall objective of this research is the development of advanced water-soluble copolymers for use in enhanced oil recovery which rely on reversible microheterogeneous associations for mobility control and reservoir conformance. Technical progress is summarized for the following tasks: advanced copolymer synthesis; characterization of molecular structure; and solution rheology.

22798 (DOE/BC/14884–1) **Surfactant loss control in chemical flooding: Spectroscopic and calorimetric study of adsorption and precipitation on reservoir minerals: Quarterly technical progress report, September 30, 1992–December 31, 1992.** Somasundaran, P. Columbia Univ., New York, NY (United States). Lowell Memorial Library. 1 Feb 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14884. Order Number DE93014741. Source: OSTI; NTIS; GPO Dep.

The aim of this project is to elucidate the mechanisms of adsorption and surface precipitation of flooding surfactants on reservoir minerals. Effect of surfactant structure, surfactant combinations and other inorganic and polymeric species will also be determined using solids of relevant mineralogy. A multi-pronged approach consisting of micro & nano spectroscopy, microcalorimetry, electrokinetics, surface tension and wettability will be used to achieve the goals. The results of this study should help in controlling surfactant loss in chemical flooding and also in developing optimum structures and conditions for efficient chemical flooding processes. Adsorption of selected individual surfactants on oxide minerals was determined. The aim was to characterize the microstructure of the adsorbed layers. Work was began with alkyl phenoxy polyoxyether type nonionic surfactants and anionic meta xylene sulfonates.

22799 (DOE/BC/14886–2) **Investigation of oil recovery improvement by coupling and interfacial tension agent and a mobility control agent in light oil reservoirs: Technical progress report, January–March 1993.** Pitts, M.J. Surtek, Inc., Golden, CO (United States). 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14886. Order Number DE93014538. Source: OSTI; NTIS; GPO Dep.

The study will investigate two major areas concerning coinjecting an interfacial tension reduction agent(s) and a mobility control agent. The first will consist of defining the mechanisms of interaction of an alkaline agent, a surfactant, and a polymer on a fluid-fluid and a fluid-rock basis. The second is the improvement of the economics of the combined technology. This report examines the effect of different alkaline agents, surfactants, and combinations of surfactant and alkaline agents on the reduction of interfacial tension between a fluvial. deltaic crude oil and the aqueous solution. In addition, the effect of alkali and surfactant addition to polymer solution viscosity are evaluated. Finally, the effect of increasing temperature on the interfacial tension characteristics and solution viscosity characteristics are discussed.

22800 (DOE/BC/14951–1) **Integrated approach towards the application of horizontal wells to improve waterflooding performance: [Quarterly] report, January 1–March 31, 1993.** Kelkar, B.G. Tulsa Univ., OK (United States). 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14951. Order Number DE93014607. Source: OSTI; NTIS; GPO Dep.

The overall purpose of the proposed project is to improve secondary recovery performance of a marginal oil field through the use of a horizontal injection well. The location and direction of the well will be selected based on the detailed reservoir description using integrated approach. We expect that 2 to 5 % of original oil in place will be recovered using this method. This should extend the life of the reservoir by at least 10 years. To accomplish the goals of the project, it is divided into two stages. In Stage 1, we will select part of the Glenn Pool field, and collect additional reservoir data by conducting cross bore hole tomography surveys and formation microscanner logs through newly drilled well. In addition, we will also utilize analogous outcrop data. By combining the state of the art data with conventional core and log data, we will develop a detailed reservoir description based on integrated approach. After conducting extensive reservoir simulation studies, we will select a location and direction of a horizontal injection well. The well will be drilled based on optimized design, and the field performance will be monitored for at least six months. If the performance is encouraging, we will enter into second budget period of the project. If continued, the second budget period of the project will involve selection of part of the same reservoir, development of reservoir description using only conventional data, simulation of flow performance using developed reservoir description, selection of a location and direction of a horizontal injection well, and implementation of the well followed by monitoring of reservoir performance. During this quarter, the technical progress is limited due to contractual problems associated with signing of the contracts with the subcontractors. Once all the contracts are signed, the project will pick up the speed and progress according to the plans.

22801 (DOE/BC/14952–2) **Secondary oil recovery from selected Carter sandstone oilfields, Black Warrior Basin, Alabama.** Anderson, J.C. Anderman/Smith Operating Co., Denver, CO (United States). 15 Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14952. Order Number DE93014609. Source: OSTI; NTIS; GPO Dep.

The objectives of this secondary oil recovery project involving the Carter sandstone in northwest Alabama are: (1) To increase the ultimate economic recovery of oil from the Carter reservoirs, thereby increasing domestic reserves and lessening US dependence on foreign oil; (2) To extensively model, test, and monitor the reservoirs so their management is optimized; and (3) To assimilate and

transfer the information and results gathered to other US oil companies to encourage them to attempt similar projects. Start-up water injection began on 0 1/12/93 at the Central Bluff Field, and daily operations began on 01/13/93. These operations include monitoring wellhead pressures at the injector and two producers, and injection water treatment. Water injection was running 200-300 bbl/day at the end of February. Once the unit is pressured-up well testing will be performed. Unitization was approved on 03/01/93.b. For the North Fairview Field correlations and log analyses were used to determine the fluid and rock properties. A summary of these properties is included in Table 1. The results of the log analysis were used to construct the hydrocarbon pore volume map shown on Figure 1. The map was planimetered to determine original oil-in-place (OOIP) values and the hydrocarbon pore volume by tract. The OOIP summed over an tracts by this method is 824.7 Mbbl (Figure 2). Original oil-in-place was also calculated directly: two such independent calculations gave 829.4 Mbbl (Table 1) and 835.6 Mbbl (Table 2). Thus, the three estimates of OOIP are within one percent. The approximately 88% of OOIP remaining provides an attractive target for secondary recovery. Injection start-up is planned for mid-June.

22802 (DOE/BC/14958–2) **Green River Formation Water Flood Demonstration Project, Uinta Basin, Utah: Quarterly technical progress report, January 1–March 31, 1993.** Lomax, J.D. (Lomax Exploration Co., Salt Lake City, UT (United States)); Nielson, D.L.; Deo, M.D. Lomax Exploration Co., Salt Lake City, UT (United States). 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14958. Order Number DE93014543. Source: OSTI; NTIS; GPO Dep.

The project concerns itself with increasing recoverable petroleum resources in the United States. The Green River Formation in Utah's Uinta Basin contains abundant hydrocarbons that are not easily recovered by means. The successful Lomax Monument Butte Unit water flood will be evaluated under this contract, and based on this information, water floods will be initiated in nearby Travis and Boundary units. In 1987, Lomax Exploration Company started a successful water flood on their Monument Butte Umt. This is a low-energy, geologically heterogeneous reservoir producing a waxy crude oil. production yielded about 5% of the OOIP, while the water flood will yield an recovery of 20% OOIP. The drilling and completion of two of the wells, one in the Monument Butte unit (10–34) and the other in the Travis (14A–28) unit, were related in the last report (December 31, 1992). The use of novel logging techniques (Formation Microimaging and Magnetic Resonance Imaging) along with the compositions of the oils and gases from the Monument Butte unit were also discussed. To update the progress of the above two wells, the Monument Butte 10–34 (11/27/92 first production) has produced 4,953 barrels of oil and 4,039 Mcf of gas and the Travis 14A-28 (1/1/93 first production) has produced 6,187 barrels of oil and 7,829 Mcf of gas from inception through March 31, 1993. Due to the success of the Travis 14A–28 completion, we recompleted the behind pipe "D" zone in the Travis 14–28 on March 8, 1993. The 14–28 has produced 2,411 barrels of oil through March 31, 1993 or 105 barrels per day.

22803 (DOE/BC/14959–2) **Revitalizing a mature oil play: Strategies for finding and producing unrecovered oil in Frio Fluvial-Deltaic reservoirs of South Texas: Technical progress report, January 1, 1993–March 31, 1993.** Tyler, N. Texas Univ., Austin, TX (United States). Bureau of Economic Geology. 31 Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14959. Order Number DE93014530. Source: OSTI; NTIS; GPO Dep.

During this second project quarter, screening of South Texas fields within the Frio Fluvial-Deltaic Sandstone/Vicksburg Fault Zone oil play was completed. Fields were to identify reservoirs that have a large remaining oil resource, are in danger of premature abandonment, and have geological and production data in sufficient quantity and of suitable quality to facilitate advanced reservoir characterization studies (subtask 1). Two fields have been selected for inclusion in this study: Tijerina-Canales-Blucher (T.C.B.) Field, located in the northern portion of the trend in Jim Wells County, and Rincon Field, located to the south in Starr County. Current plans are to incorporate data from both fields in our reservoir characterization and targeted resource addition studies. Project members met with operators of both fields to review available geologic and production field data and discuss our research plans. The collection of detailed geologic and production data required for the initial reservoir characterization studies (subtask 2) is currently underway. Details outlining specifics of project accomplishments for this quarter are provided.

22804 (DOE/CE/15553–T3) **System to inject steam and product oil from the same wellbore through downhole valve switching: Third quarterly report.** Gondouin, M. S-Cal Research Corp., San Rafael, CA (United States). 11 Jun 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92CE15553. Order Number DE93015355. Source: OSTI; NTIS; GPO Dep.

The detailed design of a sliding sleeve valve operated by wireline has been completed. This Downhole Valve is obtained by modifications of two 2 7/8 in. commercial wireline-retrievable sleeve assemblies,which will be used to connect one of the upper branches of the patented Dual Whipstock to the 2 3/8 in. steam tubing,through a thermal expansion joint. Detailed engineering drawings and materials specifications have been completed. The design of the 30 ft-long joint comprising an H joint at the top a dual whipstock at the bottom and flow control devices for up to three drainholes equipped with 1.75 in. liners has been completed for a 7 in. cased well. This combination may be used in multi-layered reservoirs as well as in single layered reservoirs. It is also compatible with rod pump locations either above the kick-off pointsor near the base of the curved part of the drainhole liners. This design provides sufficient flexibility for most potential applications in the California market.

22805 (DOE/MC/26031–11) **Field verification of CO_2-foam: [Quarterly] report, January 1–March 31, 1993.** Martin, F.D.; Heller, J.P.; Weiss, W.W. New Mexico Inst. of Mining and Technology, Socorro, NM (United States). New Mexico Petroleum Recovery Research Center. 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-89MC26031. (PRRC–93-12). Order Number DE93014517. Source: OSTI; NTIS; GPO Dep.

This project is a cooperactive industry-university-government effort to transfer laboratory research technology to a field demonstration test. The primary objective of the project is to evaluate the use of foam for mobility control and fluid diversion in a field-scale CO_2 flood. Seven tasks were identified for the completion of this four-year project: (1) evaluate and select a field site, (2) develop an initial site-specific plan, (3) conduct laboratory CO_2-foam mobility tests, (4) perform reservoir simulations, (5) design the foam slug, (6) implement a field test, and (7) evaluate results. The East Vacuum Grayburg/San Andres Unit (EVGSAU), operated by Phillips Petroleum Company (PPCo), is the site selected for a comprehensive evaluation of the use of foam for improving the effectiveness of a CO_2 flood. The project began in late 1989, and is now in the fourth and final year. The foam test design called for the initial injection of surfactant solution to satisfy the adsorption requirement of the reservoir followed by a rapid surfactant-alternating-gas (SAG) mode. The rapid SAG mode consists of 3-day cycles of surfactant solution (3000 RB) alternated with 12-day cycles of CO_2 (12,000 RB). Thus, the rapid SAG should closely approach the benefits achieved by simultaneous injection of surfactant solution and CO_2, and would provide an approximate foam quality of 80%. This quarterly report provides an update on the recent results obtained from the foam injection test and a status of supporting research related to the project.

22806 (ETDE/JP-mf–93794512, pp. 243-247) **Well Stimulation technology.: Computer modeling and laboratory experiment of hydraulically induced fractures.** Onoe, S.; Sugiyama, H.; Nanba, T. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

A discussion is given on a simulation model intended to optimize hydraulic fracturing methods, as a research related to the 'well stimulation technology' research program. This paper reports the results obtained during the fiscal year 1991. A development work

was launched on a three-dimensional hydraulic fracturing simulator for a fracture (shape prediction) model based on the investigative studies that had been carried out by the end of the previous fiscal year. The work aims at developing a crack stress analyzing program using a three-dimensional boundary element method, an inter-crack flow analyzing program using a two-dimensional finite element method, and a practical simulator to solve both programs. A basic design was performed on the former two items to begin with. A discussion was given on a method to evaluate a post-fracture model using finite conductivity solution in place of the infinite conductivity solution used in fiscal 1990. Further, efforts were made on improving the experimental accuracy in experimenting the hydraulic fracturing model, which made an experiment with sufficient reproducibility possible by means of integrating the mortar curing conditions. 1 fig., 1 tab.

22807 (ETDE/JP-mf–93794512, pp. 254-258) **Microbial EOR technology.** Murata, S.; Kogachi, T.; Shiroichi, Y. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Investigative studies have been carried out since 1987 on crude oil recovery technologies utilizing microorganisms. This paper is a 1991 annual report for the studies. Secondary screening to identify production capability quantitatively has been made on 20 stocks of microorganisms selected by the previous fiscal year (those having been verified to produce gasses, acids, surfactants, and polymers). Cultivating conditions were reviewed on most promising stocks. An oil recovery experiment was begun using TRC separating microorganisms, and so was a discussion on establishing experimental methods and on methods to evaluate oil recovery capability of the separating microorganisms. As a result, several stocks of microorganisms were discovered that have acid producing capability in excess of those having been found in the previous year, for example. It was revealed that the separation bacteria 18-2-a having the highest surfactant and polymer producing capability can maintain the capability without degradation because of freeze-dry storage or successive subcultures. It was also found that passage cultures somewhat raise the capability of producing various kinds of substances, and the optimal culturing conditions thereof were clarified. 7 tabs.

22808 (ETDE/JP-mf–93794512, pp. 259-275) **Heavy oil EOR technology.: EOR field pilot test in the Ikiztepe oil field, Turkey.** Mitsuishi, Y.; Naito, K.; Mori, S.; Harada, T.; Kubo, S.; Urabe, S. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

The Turkish National Petroleum Corporation (TAPO) and the Japanese Petroleum Public Corporation are conducting field tests as a joint research on the enhanced oil recovery (EOR) technology at the Ikiztepe heavy gravity oil field. The six-year plan for 1988 through 1993 based on the feasibility study in 1987 is being moved forward to a field pilot test. This paper is an annual report on the results during the fiscal year 1991. In the fiscal 1991, the well drilling tests carried out in the previous year continued onto modifying four wells including one waste water treating well and testing additionally three wells. Further, a conduction test was carried out to evaluate fractures recognized between the steam injection well (SI) and a production well (SP1). In addition, 11 wells were given completion works. With respect to oil bed evaluation, three-dimensional oil bed simulations were carried out using the steam method and the carbon dioxide method based on the the then available data, which provided a prospect to an optimum schem. 9 figs., 4 tabs.

22809 (ETDE/JP-mf–93794512, pp. 276-280) **Heavy oil EOR technology.: Well completion technology for EOR field pilot test.** Harada, T.; Kubo, S.; Naito, K.; Mitsuishi, Y. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

This paper reports the result of researches obtained during the fiscal 1991 on well completion technologies being carried out at the Ikiztepe oil field in Turkey as part of expedited heavy gravity oil recovery technology researches. The objective of the research is to establish an economical and optimal completion technology to solve high-temperature hazards in the steam method and corrosion in the carbon dioxide method. Items of equipment had been installed and materials had been supplied for 13 wells by the previous year, and the completion works were performed in 1991. Specifications for tubing in steam forced wells called for heat insulating dual tubing and expansion joints, 13 Cr materials in carbon dioxide forced wells, and ordinary steel and packerless specifications in the steam method. The completion work encountered a trouble caused from defects in manufacture of the high-temperature resistant packers for the steam forced wells, and the trouble was examined in the following year. But other well completion works have ended smoothly without a large problem. 2 figs., 1 tab.

22810 (ETDE/JP-mf–93794512, pp. 281-285) **Heavy oil EOR technology.: Monitoring technology for EOR process.** Kubo, S.; Harada, T.; Suzuki, K.; Mori, S.; Mitsuishi, Y. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

This paper reports the result of researches obtained during the fiscal 1991 on test monitoring techniques being carried out at the Ikiztepe oil field in Turkey as part of expedited heavy gravity oil recovery technology researches. In the steam flooding method in particular, measurements are important on quantity of heat applied to an oil bed in addition to the amount and period of time for steam flooding. Therefore, a well bottom dryness measuring apparatus is under development to meet the requirements of measuring temperatures, pressures, and steam dryness. In the fiscal 1991, systems of capillary tube (inner well pressure observing device) and thermocouple (well bottom temperature observing device) were dropped and installed in four steam flooding wells. Only capillary tubes were installed in six carbon dioxide injection wells. Steam dryness measurements used the cadmium ratio measuring system in the density measuring method using neutron logging of which effectiveness had been verified in the previous year, and the prototype II was designed and fabricated to confirm the characteristics. A patent was applied for the density measuring system using neutron logging. 3 figs., 2 tabs.

22811 (ETDE/JP-mf–93794512, pp. 286-292) **Heavy oil EOR technology.: Basic research on a steam flooding process under high pressure and high temperature for whole core.** Kogachi, T.; Taya, Y. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Investigations are given on steam scavenging processes with simulated experiment on oil bed rocks as part of the steam flooding pilot test, an international joint research, and researches are made to help evaluate numerical simulations and pilot tests. The experiment forced steam into test cores at a constant pressure, and measured the steam and oil recovered from a core holder outlet. Such troubles experienced up to the previous year as blocking of the outlet by high-viscosity crude oil and improper weighing were improved for the experiment (dualizing the pressure control valve, and shortening and simplifying the piping). Although a preliminary experiment which served also as a start-up operation has eliminated the problems having existed prior to the improvement, the core samples from the Ikizpete oil field did not produce fluids even after a lapse of 25 hours in the main experiment using a pressure of 112 kgf/cm^2 at the forcing side and a pressure differential of 5 to 11 kgf/cm^2 at the outlet. The problem awaiting solution is to elucidate overall influence including the pressure differential setting, the core characteristics, and thermal loss at the holder. 6 figs., 4 tabs.

22812 (ETDE/JP-mf–93794512, pp. 293-303) **Heavy oil EOR technology.: Application of thermal reservoir simulation technology to a steam flood field pilot test in a heavy oil reservoir.** Suzuki, K. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

With an objective of improving the accuracy in oil bed behavior evaluation, a thermal reservoir simulator was applied to a steam flooding pilot test under progress at an actual oil field. Its processes and results have been discussed. In the fiscal year 1991,

oil bed behavior presented by field data taken during a period of about 700 days and the simulation results were compared and discussed using a full pattern model. Further, influences of uncertain factors including permeability of faults were discussed and compared with the results of physical exploration. A history matching was carried out using a structured basic model. It was verified that the oil bed behavior during the subject period of time can be reproduced nearly completely. A 1-8 symmetry model cannot reproduce such an oil bed condition that the forced steam in this pilot test contributes biasedly. Next, an investigation on sensitivity relating to permeability of faults revealed that the permeability affects little the reproducibility of the simulation. 4 figs., 2 tabs.

22813 (ETDE/JP-mf–93794512, pp. 304-308) **Enhanced oil recovery.: Field pilot test on CO2 flood.** Yasuda, M.; Urabe, S. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

With objectives to evaluate mechanisms of a tertiary recovery process in the carbon dioxide flooding method and establish a comprehensive technique for actual operation as part of a joint EOR research at IEA, field tests are under progress at the Kubiki oil field in Niigata Prefecture under a five-year plan that started in 1988. This paper is an annual report on results obtained during the fiscal year 1991. Based on the preliminary stage that had been completed by the previous year, carbon dioxide forcing tests were carried out in 1991. Carbon dioxide was forced initially at quantities from 5 tons to 7 tons daily on a trial basis, but the flooding performance has improved gradually up to 15 tons a day. The cumulative amount of flooded gas reached about 4200 tons as of the end of the fiscal 1991. It was revealed from a step rate test that the forcing performance improves as the carbon dioxide forcing progresses over the case of using water. A PI logging verified that residual oil from a water flooding process is moving fluidly as a result of the carbon dioxide flooding, and a CNL logging showed a decrease in porosity inferred to have occurred because of arrival of carbon dioxide. Other laboratory tests have also been conducted. 6 figs., 2 tabs.

22814 (ETDE/JP-mf–93794512, pp. 456-463) **Technologies for offshore marginal oil field development.: Optimization program for SPM system.** Wada, H.; Yokokura, K.; Jingu, N.; Tezuka, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

As a sub-theme for the special research project, 'Technologies for offshore marginal oil field development', a single-point mooring type floating production system was selected suitable for a given condition of oil field at medium depths from 400 m to 500 m. Development works have been carried out on practical programs to analyze motions of the system under a five-year plan from 1990 to 1994. This paper reports the results obtained during the fiscal 1991. The major part of the programs was prepared and a basic plan for verification water tank experiments was planned in the fiscal 1991. Series calculations were performed to expand the optimization data base subsequently to those conducted in the previous year, and new hydrographic data were collected. In preparing the programs, for example, an analytical program was developed for motions and restraining forces on an articulated single-point mooring system in waves, winds, and currents. Also prepared were the programs for analyzing static balance in a turret mooring system, and calculating frequency regions and time regions. 4 figs., 2 tabs.

22815 (ETDE/JP-mf–93794512, pp. 464-472) **Technologies for offshore marginal oil field development.: Optimization program for a new configuration of FPS.** Ohashi, M.; Yokokura, K.; Jingu, N.; Tezuka, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Based on the trend of offshore oil field development going further into sea areas with severer natural conditions, development efforts are being made on a floating production system using new type vessels equipped with high operation rates and required oil storing capacities. The development works are made as a sub-theme for the special research project, 'Technologies for offshore marginal oil field development' under a five-year plan from 1990 to 1994. This paper reports the results obtained during the fiscal 1991. The following results were achieved during the subject fiscal year according to the long-term research schedule: development of static analysis programs for a platform equipped with a position retaining device; discussions on measures to reduce rolls related to the new vessel shape; water tank experiments to obtain data to discuss the measures; and development of a basic calculation part for the program to analyze rolls of new shape vessels. For instance, in the new type platforms, tests were given on mechanisms of submerged flat plates, protruding fins, aerofoil fins, and open-type roll reducing tanks, as measures to reduce a pitch long-cycle motion which has been a problem in a mono-column shape vessels. 6 figs.

22816 (ETDE/JP-mf–93794512, pp. 473-481) **Technologies for offshore marginal oil field development.: Optimum design method for compliant tower.** Ohashi, M.; Matsui, Y.; Tezuka, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Noticing a compliant tower among production facilities for oil fields at medium depths, its structural behavior is identified, and its analyzing technologies and optimization technologies are discussed, as a sub-theme for the special research project, 'Technologies for offshore marginal oil field development' under a five-year plan from 1990 to 1995. This paper reports the results obtained during the fiscal 1991. Different types of compliant towers were compared, an optimal concept was selected, and discussions were given on equivalent linearization methods for pile-ground models as well as seismic responses in the fiscal 1991 according to the long-term research schedule. For instance, with respect to the last item, extents of seismic effects were discussed by investigating the effects of seismic responses on the tower and piles, and comparing the responses with wave responses. As a result, it was revealed that seismic analyses are required if installing locations fall under the Zone-4 and Zone-5 in the RP2A 18th section in the API. 6 figs., 5 tabs.

22817 (ETDE/JP-mf–93794512, pp. 482-489) **Technologies for offshore marginal oil field development.: Application of subsea systems.** Tada, Y.; Wada, H.; Shoda, N.; Takehira, S.; Yokokura, K.; Tezuka, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Discussions are being given on achieving evaluation and optimization of the applicability of a production system using se bottom completing wells, as a sub-theme for the special research project, 'Technologies for offshore marginal oil field development'. This paper reports the results obtained during the fiscal 1991. The research works carried out in the current fiscal year included 'analysis of application records and trends in sea bottom completing systems' and 'investigation on existing technologies and systematization of design methods'. The data base developed by the Subsea Data Services Inc. was used to summarize the current situation and the trends of the systems from the aspects of locations, installing depths, tree types, and control types. Investigation on technical trends was made on those used in North Sea, from which the trends were clarified that design standardization and diver-free technology development are being moved forward positively with emphasis placed on safety and cost. The technology investigation elucidated characteristics of different intervention methods, and problems inherent to completion systems. 4 figs., 2 tabs.

22818 (ETDE/JP-mf–93794512, pp. 490-497) **Technologies for offshore marginal oil field development.: Optimization program for offshore oil field development system.** Tada, Y.; Wada, H.; Shoda, N.; Takehira, S.; Tezuka, N.; Yokokura, K.; Matsui, Y.; Ohashi, M.; Matsuo, T. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Establishing evaluation technologies is targetted to optimize systems by means of defining technical applicability and factor calculations on different elementary facilities constituting an offshore oil field development system, as a sub-theme for the special

research project, 'Technologies for offshore marginal oil field development'. The work is being moved forward under a new five-year plan from the 1990 to 1994 fiscal years based on the previously developed 'system selection program (NEPTUNE)', and keeping the pace with further technical progresses. This paper reports the results obtained during the fiscal 1993. Major items of works carried out during the current fiscal year included renewal of the NEPTUNE registered data, collection of technical trend data in the world, selection of development concepts based thereon, as well as concept designs to structure new evaluation aiding systems. From the aspect of software development, for example, a necessity was recognized that the system be structured well balanced in the data control system, the AI tools and the data base. 6 figs.

22819 (ETDE/JP-mf–93794512, pp. 498-502) **Technologies for offshore marginal oil field development.: Flexible production riser system for deep water.** Wada, H.; Tada, Y.; Tezuka, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991*. Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Development is being made on light-weight flexible production risers for use in a production system used in medium depth sea areas, as a sub-theme for the special research project, 'Technologies for offshore marginal oil field development'. The development is aimed at reducing weight of the conventional production risers for delivering crude oil produced at sea bottoms to the surface that had a loading problem because of their great weight due to the multi-layer steel structure. The development is being moved forward under a four-year plan that started in the 1990 fiscal year. During the fiscal 1991, two prototype risers using fiber reinforced plastics (FRP) in the shaft force reinforcing layer and another two prototypes using high strength steels in the reinforcing layer were fabricated. The two types of FRP reinforced risers were verified capable of withstanding a design pressure of 350 kg/cm^2. Good results were obtained also on the methods of attaching terminal joints to the risers. Also carried out was a water tank experiment simulating a water depth of 400 m to evaluate stability of the riser shapes, investigate problems in the installing techniques, and discuss methods to analyze riser side pressures. 4 figs.

22820 (GBHW–93013128) **[Branched horizontal well drilling].** Grigoryan, A.M. Grigoryan Branched-Horizontal Wells Co., Los Angeles, CA (United States). [1993]. 14p. Source: OSTI; Grigoryan Branched-Horizontal Wells Co., 1637 N. Vine St., Suite 916, Los Angeles, CA 90028.

In the former USSR, invented the technology of drilling and brought the industrial level a new type of oil wells - Grigoryan Branched-Horizontal wells. Tens of experimental wells had been drilled and successfully operated for a long period of time. The technology itself is unique, it was developed in isolation from the West and has left far behind all known methods by its effectiveness and technical characteristics. A single hole horizontal drilling which is being now applied all around the world is a small part of this method. A branched well has several additional holes with their branches. Such well is incomparably more effective than single horizontal hole as the branches penetrate in all directions the whole mass of productive formation by their canals free for oil inflow from distant zones, often isolated. In modern application this method enables to get wells with up to 20 times higher production rates and simultaneously 5 times less oil production costs. In order to commercialize technology a "Grigoryan Branched-Horizontal wells Co." is being established for the development of oil fields, on ownership, lease or contractor basis. The Branched-Horizontal wells are especially effective in high thickness oil reservoirs with highly irregular porosity and rock permeability where the percentage of oil recovery is low while the potential reserves are very large. If in such a field oil Production of conventional well is only 10–20 ton (60–180 barrels) per day, one Branched-Horizontal well will produce an additional 10 million dollars worth of oil even during the first year of operation. This is the oil extracted from the bowels of the earth above the capacity of ordinary wells and inaccessible for them. Taking into consideration the fact that on average, only 20% of natural resources are being extracted around the world, the main advantage of this method is in doubling the recoverable reserves thus moving far ahead the predicted exhaustion of fossil hydrocarbons.

All project goals have been satisfied including. (1) Digitizable images of pore networks have been developed. (2) Video tapes of immiscible and miscible micromodel experiments at reservoir conditions were created. (3) High-pressure, flow visualization apparatus design and high pressure coreflood design are presented. Methodology for understanding 2-D to 3-D scaleup phenomena at the pore-level is demonstrated. (4) Micromodel experiments were simulated with the new multi-porosity, natural fracture oil reservoir simulator. This information will be used in the further development of a new, predictive, oil and gas reservoir simulator which is based upon lattice gas methods. The long range goal for this project is to develop for the independent oil and gas producers in the US a better predictive tool for the determination of oil and gas reservoir performance throughout the life of the field. This information is critically important for the independent to determine correctly the risk of his investment to develop and produce the field.

22822 (NIPER–578) **Feasibility study of heavy oil recovery in the Permian Basin (Texas and New Mexico).** Olsen, D.K.; Johnson, W.I. National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). May 1993. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE93000141. Source: OSTI; NTIS; INIS; GPO Dep.

This report is one of a series of publications assessing the feasibility of increasing domestic heavy oil production. Each report covers select areas of the United States. The Permian Basin of West Texas and Southeastern New Mexico is made up of the Midland, Delaware, Val Verde, and Kerr Basins; the Northwestern, Eastern, and Southern shelves; the Central Basin Platform, and the Sheffield Channel. The present day Permian Basin was one sedimentary basin until uplift and subsidence occurred during Pennsylvanian and early Permian Age to create the configuration of the basins, shelves, and platform of today. The basin has been a major light oil producing area served by an extensive pipeline network connected to refineries designed to process light sweet and limited sour crude oil. Limited resources of heavy oil (10° to 20° API gravity) occurs in both carbonate and sandstone reservoirs of Permian and Cretaceous Age. The largest cumulative heavy oil production comes from fluvial sandstones of the Cretaceous Trinity Group. Permian heavy oil is principally paraffinic and thus commands a higher price than asphaltic California heavy oil. Heavy oil in deeper reservoirs has solution gas and low viscosity and thus can be produced by primary and by waterflooding. Because of the nature of the resource, the Permian Basin should not be considered a major heavy oil producing area.

22823 (NIPER–663) **Imaging techniques applied to the study of fluids in porous media: Scaling up in Class 1 reservoir type rock.** Tomutsa, L.; Brinkmeyer, A.; Doughty, D. National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Apr 1993. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE93000135. Source: OSTI; NTIS; GPO Dep.

A synergistic rock characterization methodology has been developed. It derives reservoir engineering parameters from X-ray tomography (CT) scanning, computer assisted petrographic image analysis, minipermeameter measurements, and nuclear magnetic resonance imaging (NMRI). This rock characterization methodology is used to investigate the effect of small-scale rock heterogeneity on oil distribution and recovery. It is also used to investigate the applicability of imaging technologies to the development of scaleup procedures from core plug to whole core, by comparing the results of detailed simulations with the images ofthe fluid distributions observed by CT scanning. By using the rock and fluid detailed data generated by imaging technology describe, one can verify directly,

in the laboratory, various scaling up techniques. Asan example, realizations of rock properties statistically and spatially compatible with the observed values are generated by one of the various stochastic methods available (fuming bands) and are used as simulator input. The simulation results were compared with both the simulation results using the true rock properties and the fluid distributions observed by CT. Conclusions regarding the effect of the various permeability models on waterflood oil recovery were formulated.

22824 (NIPER–686) **Monthly progress report for April 1993.** National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). May 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE93014219. Source: OSTI; NTIS; GPO Dep.

Accomplishments for the month of April are described briefly for the following tasks: energy production research; fuels research; and supplemental government program. Energy production research includes: reservoir assessment and characterization; TORIS research support; development of improved microbial flooding methods; development of improved chemical flooding methods; development of improved alkaline flooding methods; mobility control and sweep improvement in chemical flooding; gas flood performance prediction improvement; mobility control, profile modification, and sweep improvement in gas flooding; three-phase relative permeability research; thermal processes for light oil recovery; thermal processes for heavy oil recovery; and imaging techniques applied to the study of fluids in porous media. Fuel research includes: development of analytical methodology for analysis of heavy crudes; and thermochemistry and thermophysical properties of organic nitrogen- and diheteratom-containing compounds. Supplemental government program includes: microbial-enhanced waterflooding field project; feasibility study of heavy oil recovery in the midcontinent region–Oklahoma, Kansas, and Missouri; surfactant-enhanced alkaline flooding field project; process- engineering property measurements on heavy petroleum components; development and application of petroleum production technologies; upgrade BPO crude oil data base; simulation analysis of steam-foam projects; DOE education initiative project; field application of foams for oil production symposium; technology transfer to independent producers; compilations and analysis of outcrop data from the Muddy and Almond Formations; implementation of oil and gas technology transfer initiative; and horizontal well production from fractured reservoirs.

22825 (SAND–92-1711) **Analysis of sucker rod and sinkerbar failures.** Waggoner, J.R.; Buchheit, R.G. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013600. Source: OSTI; NTIS; GPO Dep.

This report presents results of a study of performance and failures of the sucker rod/sinkerbar string used in beam-pumping operations through metallography, finite element analysis, and failure data collection. Metallography showed that the microstructure of the steel bar stock needs to be considered to improve the fatigue resistance of the sucker rod strings. The current specification based on tensile strength, or yield strength, may not be appropriate since failure occurs because of fatigue and not yielding, and tensile strength is not always a good measure of fatigue resistance. Finite element analysis of the threaded connection quantitatively assesses the coupling designs under various loading conditions. Subcritical fractures in metallography are also suggested by calculated stress distribution in threaded coupling. Failure data illustrates both magnitude and frequency of failures, as well as categorizing the suspected cause of failure. Application of the results in each of these project areas is expected to yield improved choice of metal bar stock, thread design, and make-up practices which can significantly reduce the frequency of sucker rod failures. Sucker rod failures today are not inherent in the process, but can be minimized through the application of new technology and observation of common-sense practices.

0204 Processing

22826 (BNL–48524) **Fuel quality issues in the oil heat industry.** Litzke, Wai-Lin. Brookhaven National Lab., Upton, NY (United States). Dec 1992. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93011644. Source: OSTI; NTIS; GPO Dep.

The quality of fuel oil plays an essential role in combustion performance and efficient operation of residential heating equipment. With the present concerns by the oil-heat industry of declining fuel-oil quality, a study was initiated to identify the factors that have brought about changes in the quality of distillate fuel. A background of information will be provided to the industry, which is necessary to deal with the problems relating to the fuel. The high needs for servicing heating equipment are usually the result of the poor handling characteristics of the fuel during cold weather, the buildup of dirt and water in storage tanks, and microbial growth. A discussion of how to deal with these problems is presented in this paper. The effectiveness of fuel additives to control these problems of quality is also covered to help users better understand the functions and limitations of chemical treatment. Test data have been collected which measure and compare changes in the properties of fuel using selected additives.

22827 (CONF-9207203–, pp. 219-222) **Suppression of product coke in the hydrotreating process of heavy oil.** Tsumura, O. (Idemitsu Kosan Co. Ltd., Tokyo (Japan)); Kato, K.; Okano, A.; Shimizu, T.; Tanaka, R. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Heavy oil and sand oil produce coke during hydrotreating and refining processes and tend to aggravate the operability and economic effect. Accordingly, discussions were given on relationship between properties of depressurization residual fraction (525°C$^+$; VR) and coke production amount, and methods to reduce the coke production. The heavy oil selected was the one produced at Lloydminster in Canada (Ld), which was compared with heavy oil of Middle East origin (AH). The VR-Ld had higher density, viscosity and V/Ni than the VR-AH, and contained two times as much of resin and asphaltene considered to be coke precursors. Hydrogen donating fraction was added into the heavy oil to perform a pylolytic experiment in an autoclave. The result was that when depressurized light oil is mixed in the VR, the coke production was reduced at more than the dilution effect. This was thought because partial structure with shuttle effect in the depressurized light oil accelerates migration of gaseous hydrogen, and gives hydrogen stabilization to radicals in the asphaltene. 7 figs., 6 tabs.

22828 (CONF-9207203–, pp. 223-226) **Application of HSC residue for in-plant boiler fuel.** Otsubo, T. (Mitsui Kosan Chemicals Co. Ltd., Tokyo (Japan)); Fukuyama, H. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The high conversion soaker cracking (HSC) developed as a high decomposition visbreaker has a long operation history also as a commercial plant. This paper reports the features of the process and application of HSC residue for in-plant boiler fuel. The process has advanced one step ahead of the conventional visbreaking process and realized higher decomposition rates to obtain the residue in stable liquid state. The process features that pyrolysis is carried out in a normal pressure soaker drum with long residence time and sufficient steam blown in; a multi-stage bubble column of gas-liquid counterflow type is used in the reactor to keep the gas and air in good contact; and their mixing in an axial direction is suppressed. The S oil refinery having operated the system for three and half years converts heavy oil into gasoline, and at the same time supplies the residue to a power generation plant located 2 km away,

where the residue is used stably and efficiently as fuel. 2 figs., 2 tabs.

22829 (CONF-9207203–, pp. 233-234) **Study on cyclic gasification catalyst. 2.** Uchida, H. (Tokyo Gas Co. Ltd., Tokyo (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

This paper reports a summary of development of a nickel-based catalyst having excellent activity and durability to be used in a cyclic gasification equipment for manufacturing city gases. A trial fabrication was carried out of a support containing CaO-6Al2O3 and SrO-6Al2O3, a composite oxide of alkali earth metal and aluminum (hereinafter the support A) and a catalyst with mullite (2SiO2-3Al2O3) support loaded with nickel oxide at 5%. It was found that the catalyst with the support A has heat resistance that can maintain a large surface area even under elevated temperatures and as large catalyst specific area as 8 m^2 when compared to that of 1 m^2 in conventional silica and alumina supports, which provided good dispersion of activated metals. To explain, in a steaming test at 800°c for 15 hours, production of nickel aluminate which can cause thermal degradation was less, and in butane gasification test, the gas productivity and selectivity were superior. 3 refs., 2 figs., 1 tab.

22830 (CONF-9207203–, pp. 235-236) **Development of efficient desulfurization process of diesel fuel using oxidation reaction.** Aida, T. (Kinki University, Osaka (Japan). Faculty of Engineering); Ito, T.; Sakata, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

In a situation that different types of efficient desulfurization process are studied, this paper discusses application of the coal oxidation-alkaline decomposition process developed as reported in the previous papers. The process oxidizes selectively organic sulfur component in coal and separates it utilizing changes in its physicochemical properties. For example, when dimethyl sulfide is oxidized into dimethyl sulfoxide, its boiling point changes largely from 38°C to 189°C, and it becomes water soluble. These changes could occur to benzothiophene in light oil or dibenzothiophene derivatives. Accordingly, as a result of oxidizing light oil in a formic acid/hydrogen peroxide system and comparing GC chart distributions of sulfur component before and after the oxidation, noticeable changes were recognized in the boiling point and the polarity in organic sulfur compound. This oxidized oil was desulfurized using distillation, solvent extraction, adsorption and separation, where a sulfur content of 0.05% was achieved easily. 2 refs., 2 figs.

22831 (DOE/BC/14853–3) **Continued support of "The Natural Resources Information System (NRIS) for the State of Oklahoma": Quarterly technical progress report, January 1, 1993–March 31, 1993.** Mankin, C.J. (Oklahoma Geological Survey, Norman, OK (United States)); Rizzuti, T.P. Oklahoma Geological Survey, Norman, OK (United States). 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92BC14853. Order Number DE93014642. Source: OSTI; NTIS; GPO Dep.

The objective of this research program is to continue developing, editing, maintaining, utilizing and making publicly available the Oil and Gas Well History file portion of the Natural Resources Information System (NRIS) for the State of Oklahoma. The Oklahoma Geological Survey, working with Geological Information Systems at the University of Oklahoma Sarkeys Energy Center, has undertaken to construct this information system in response to the need for a computerized, centrally located library containing accurate, detailed information on the state's natural resources. Particular emphasis during this phase of NRIS development is being placed on computerizing information related to the energy needs of the nation, specifically oil and gas. The NRIS Well History file contains historical and recent completion records for oil and gas wells reported to the Oklahoma Corporation Commission on Form 1002-A. At the start of this quarter, the Well History file contained 283,751 records, providing geographical coverage for most of Oklahoma (all but the northeast part of the State). Data elements on this file include API well number, lease name and well number, location information, elevations, dates of significant activities for the well and formation items (e.g., formation names, completion and test data, depths and perforations). In addition to the standard Well History file processing, special projects are undertaken to add supplemental data to the file from well logs, scout tickets, and core and sample documentation.

22832 (DOE/EIA–0109(93/04)) **Petroleum supply monthly, April 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 4 May 1993. 178p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013203. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Supply Monthly (PSM) is one of a family of four publications produced by the Petroleum Supply Division within the Energy Information Administration (EIA) reflecting different levels of data timeliness and completeness. The other publications are the Weekly Petroleum Status Report (WPSR), the Winter Fuels Report, and the Petroleum Supply Annual (PSA). Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in primary supply. Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United States. Data presented in the PSM are divided into two sections: Summary Statistics and Detailed Statistics.

22833 (DOE/EIA–0130(93/04)) **Natural gas monthly, April 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 3 May 1993. 149p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012896. Source: OSTI; NTIS; GPO; GPO Dep.

The Natural Gas Monthly (NGM) highlights activities, events, and analyses of interest to public and private sector organizations associated with the natural gas industry. Volume and price data are presented each month for natural gas production, distribution, consumption, and interest pipeline activities. Producer-related activities and underground storage data are also reported. From time to time, the NGM features articles designed to assist readers in using and interpreting natural gas information. This month's feature article is titled Revisions to Monthly Natural Gas Data.

22834 (DOE/EIA–0520(93/04)) **International petroleum statistics report, April 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 29 Apr 1993. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013129. Source: OSTI; NTIS; GPO; GPO Dep.

The International Petroleum Statistics Report presents data on international oil production, demand, imports, exports, and stocks. The report has four sections. Section 1 contains time series data on world oil production, and on oil demand and stocks in the Organization for Economic Cooperation and Development (OECD). This section contains annual data beginning in 1980, and monthly data for the most recent two years. Section 2 presents an oil supply/demand balance for world. This balance is presented in quarterly

intervals for the most recent two years. Section 3 presents data on oil imports by OECD countries. This section contains annual data for the most recent year, quarterly data for the most recent two quarters, and monthly data for the most recent twelve months. Section 4 presents annual time series data on world oil production and oil stocks demand and trade in OECD countries. World oil production and OECD demand data are for the years 1970 through 1991; OECD stocks from 1973 through 1991; and OECD trade from 1982 through 1991.

22835 (ETDE/JP-mf–93794512) **Record of TRC's activities in the fiscal year 1991.** Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). Order Number DE93794512. Source: OSTI; NTIS; Available from Japan National Oil Corp., 2-2, Uchisaiwaicho 2-chome, Chiyoda-ku, Tokyo, Japan.

Since its foundation in 1972, the Technology Research Center has been continuing with various activities to perform centrally and comprehensively introduction of new technologies, development and improvement of existing technologies, technical transfer, technical services, and engineer training as a core organization to support petroleum developing technologies in Japan. The present paper is a record of these activities, covering organizations, budgets, facilities, research operations to education and training operations, and internationally cooperative research operations. The research and development operations implemented and created results during the fiscal 1991 include: eight themes including the 'microorganism EOR technology' as the working research program; nine themes including the 'surface geochemical technology for mine probing' as the large-scale research program; and six themes including the 'well stimulation technology' as the special research program. The education and training operations opened in succession to those in the previous year three courses for mine prospecting, oil bed engineerings, and geology and geochemistry inviting 49 engineers from 19 nations. International joint researches in cooperation with organizations in other countries were also conducted actively including invitation of 11 persons and long-term dispatch of 5 persons.

22836 (IFP–40394-1) **The world economy of petroleum products and the strategy of a petroleum company from exporting country: Cases of SONATRACH (Algeria), KPC (Kuwait), PEMEX (Mexico), PDVSA (Venezuela). First volume.** Preure, M. Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Technip, 92 - Rueil-Malmaison (France). Dec 1992. [320p.] (In French). Order Number DE93626477. Source: OSTI; NTIS (US Sales Only); INIS.

This thesis contains 2 volumes. In this first volume, the author describes in a first part the world economy of petroleum and natural gas products: Historical aspects and relationships between the different actors; General structure of the world economy of petroleum and gas products and actual trends. In a second part, the relationships between petroleum products, national economic development and problem of technology conservation are studied. The cases of Algeria, Kuwait, Mexico and Venezuela are given. 258 refs., 103 tabs.

22837 (IFP–40394-2) **The world economy of petroleum products and the strategy of a petroleum company from exporting country: Cases of SONATRACH (Algeria), KPC (Kuwait), PEMEX (Mexico), PDVSA (Venezuela). Second volume.** Preure, M. Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Technip, 92 - Rueil-Malmaison (France). Dec 1992. [388p.] (In French). Order Number DE93626478. Source: OSTI; NTIS (US Sales Only); INIS.

This thesis contains 2 volumes. In this second volume, the author describes the industrial and technological developments and the strategy of petroleum companies in exporting countries. The main industrial strategies studied are national integration strategy in a planned economy (case of Algeria) or in a controlled-liberal economy (case of Mexico) and international integration strategies to the lower part of petroleum industry and external growth (cases of Kuwait and Venezuela). Technological strategies studied are development of a national engineering, information, research programs/development and innovation. The last chapter takes stock of research and development programs for petroleum products (case of Mexico) . 258 refs., 103 tabs.

0208 Waste Management

22838 (DOE/MT/92007–2) **Characterization of oil and gas waste disposal practices and assessment of treatment costs engineering: [Quarterly] report, January 1, 1993–March 31, 1993.** Bedient, P.B. Rice Univ., Houston, TX (United States). Dept. of Environmental Sciences and Engineering. 22 Apr 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92007. Order Number DE93014604. Source: OSTI; NTIS; GPO Dep.

This report covers work completed during the third quarter for the project. The project consists of three tasks: the first relates to developing a database of waste volumes and disposal methods used by theindustry; the second and third-tasks are aimed at investigating technologies that could be used for the treatment of produced waters and developing cost estimates for those technologies. Efforts in the past quarter were aimed at finalizing the design of the planned survey for this project. The selected design divides the survey by topic into three sections: (1) drilling wastes; (2) associated wastes; and (3) producedwater. A literature survey of the environmental impacts of oil and gas activities was conducted. Maps of oil and gas fields in each state were compiled. To date, maps for the following states have been received: Alabama, Alaska, Arkansas, California, Colorado, Michigan, Montana, Nevada, New York, North Dakota, Ohio, Oklahoma, Pennsylvania, South Dakota, Tennessee, Utah, and Wyoming. Maps from other states are being pursued. During the past quarter, contact was made with several individuals thought to have some pertinent information regarding this project. Most notable among the material received was a study conducted by Remediation Technologies, Inc. in conjunction with Gas Research Institute that was used to develop management strategies to handle environmental problems encountered in the natural gas production industry. This study has provided a blueprint for the spreadsheet based model that win compute the costs of waste management scenarios in an iterative fashion for this project.

22839 (DOE/MT/92008–1) **Development of a cost-effective environmental compliance technology for stripper well brines: Quarterly report, October 1, 1992–December 31, 1992.** Adewumi, M.A.; Watson, R.W. Pennsylvania State Univ., University Park, PA (United States). Dept. of Mineral Engineering. 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92008. Order Number DE93014602. Source: OSTI; NTIS; GPO Dep.

In order to demonstrate to the EPA that both from both stripper oil and marginal gas wells in the Appalachain Basin are capable of being treated and disposed of by discharge to streams in an effort on stripper oil well brines will be continued and expanded to examine the range of brines produced from marginal gas wells. The specific object of the research is to demonstrate that the characteristics of wastewater from stripper oil wells and marginal gas wells are sufficiently similar to be treated under a standardized treatment methodology, that the environmental impacts of the discharge of treated brines from both stripper oil and marginal wells can be adequately regulated, and that the inclusion of marginal gas wells in the same category as stripper oil wells is appropriate especially for wells operating in the Appalachian Basin. During this quarter, work on the critical pH studies was completed and work was initiated on determining the catalytic effect of one metal on another. In particular, the studies of copper's effect on aluminum were completed. This series of tests proved that the experimental techniques used for the measurement of catalytic effects are effective.

22840 (DOE/MT/92008–2) **Development of a cost effective environment compliance technology for stripper brine wells: [Quarterly] report, January 1, 1993–March 31, 1993.** Adewumi, M.A.; Watson, R.W.; Tian, S.; Heckman, S.; Safargar, S. Pennsylvania State Univ., University Park, PA (United States). Dept. of Mineral Engineering. 17 May 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92008. Order Number DE93014603. Source: OSTI; NTIS; GPO Dep.

The specific objective of the research is to demonstrate that the characteristics of wastewater from stripper oil wells and marginal gas wells are sufficiently similar to be treated under a standardized treatment methodology, that the environmental impacts of the discharge of treated brines from both snipper oil and marginal gas

wells can be adequately regulated, and that the inclusion of marginal gas wells in the same category as stripper oil wells is appropriate, especially for wells operating in the Appalachian Basin. During this reporting period, the catalytic effect studies were completed including the effect of copper on lead and zinc as well as the effects of lead and zinc as catalysts. The field studies were to be extended to investigate the system's effectiveness in removing organics as well as the other heavy metals. The major accomplishment during this quarter was establishing the system's effectiveness in removing organics from the field brines. The supporting data are presented in this report.

22841 (DOE/MT/92009–T1) **Evaluation of the freeze-thaw/evaporation process for the treatment of produced waters: Quarterly technical progress report, January 1–March 31, 1993.** Boysen, J.; Morotti, J. Resource Technology Corp., Laramie, WY (United States). Apr 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92009. Order Number DE93014508. Source: OSTI; NTIS; GPO Dep.

Water purification by using natural conditions to promote freezing appears to be an extremely attractive freeze-crystallization process for the treatment of contaminated water in many areas where natural climatic conditions will seasonally promote freezing. The natural freezing process can be coupled with natural evaporative processes to treat oil and gas produced waters year round in regions with favorable climatic conditions. The objectives of this research are related to development of a commercially-economic natural freeze-thaw/evaporation (FTE) process for the treatment and purification of water produced in conjunction with oil and gas. During the reporting period of 1/1/93 to 3/31/93, project research concentrated on the completion of the Task 1 Summary Report. Task 1 objectives to develop an economic model and determine the commercial viability, economically significant parameters, and research issues of the FTE process have been achieved. Regulatory requirements and associated costs for an FTE facility were found to be similar to those of conventional processes. Two benefits of the FTE process, that make it more environmentally acceptable are: (1) the treated water may be beneficially used and (2) the volume of brine disposal is small compared to disposal of the production water by conventional methods. Based upon the results of the economic evaluation, the FTE process is commercially feasible if operated as described in the base case scenario. In fact, current disposal cost data acquired in Subtask 1.3 indicates the base case water treatment cost of $0.20/bbl is very favorable, less than one-third of the current costs independent producers are paying for disposal at a commercial injection well.

Task 3 (Environmental Field Sampling and Analysis of NORM, Heavy Metals, and Organics) activities included the continuation of the platform selection process. A revised sampling plan and a projected cost estimate were prepared for Task 3. A letter detailing the revised plan was sent to the Scientific Review Committee (SRC). Task 4 (Monitoring of the Recovery of Impacted Wetland and Open Bay Produced Water Discharge Sites in Coastal Louisiana and Texas) activities involved receiving the final approval for sampling two facilities and requesting approval for a third alternative facility. A revised Task 4 sampling plan and projected estimated costs were prepared. The sampling plan was presented to the SRC for comment. Mobilization activities for the first quarterly sampling were initiated. Task 5 (Assessment of Economic Impactsof Offshore and Coastal Discharge Requirements on Present and Future Operations in the Gulf of Mexico Region) activities included refining the model for estimating the impact of increased environmental compliance costs on remaining reserves in coastal and offshore fields. Task 6 (Synthesis of Gulf of Mexico Seafood Consumption and Use Patterns) activities involved completion and field testing of most survey forms. Retail surveys were initiated and contacts were made with the Vietnamese community. Task 7 (Technology Transfer Plan) work has included scheduling the presentation of information concerning this project at the DOE Contractor Review Meeting in July in Oklahoma. Task 8 (Project Management and Deliverables) activities have involved the submission of the necessary reports and routine management.

22843 (NEI-NO–338) **Environmental program. Phase 1: Summary report.** Oljeindustriens Landsforening, Stavanger (Norway). Dec 1991. 32p. (In Norwegian). Order Number DE93794943. Source: OSTI; NTIS; INIS.

The Norwegian Oil Industry Association (OLF) has initiated an environmental program that has been carried out in cooperation with the Ministry of Petroleum and Energy and the Ministry of the Environment. The program is directed towards emissions to air and discharges to sea from Norwegian offshore oil and gas production operations. The objective is to elucidate the relation between environmental improvements and the costs attached to these improvements. The program is carried through in two phases. In phase 1, emissions and discharge quantities from the industry were established, ongoing studies and research work among the OLF member companies were mapped, and an initial evaluation of emission and discharge reduction measures was performed. Phase 1 also recommended areas to be further evaluated in phase 2. 10 figs., 8 tabs.

22844 (NEI-NO–339) **Environmental program. Phase 2: Summary report.** Oljeindustriens Landsforening, Stavanger (Norway). Mar 1993. 134p. Order Number DE93794945. Source: OSTI; NTIS; INIS.

The Norwegian Oil Industry Association (OLF) has between 1991 and 1993 conducted an environmental program. The objectives were to: Enhance the knowledge of emissions to air and discharges to sea from Norwegian offshore oil and gas production operations. Evaluate the technology and the associated costs for potential reduction of continuous emissions and discharges. Phase 2 of the program has in particular focused on the relationship between the cost and benefit of emission and discharge reduction measures. The purpose has been to identify the measures giving the largest reductions per unit cost. This has now been performed and is documented in 24 technical reports. Total production of oil and gas from the Norwegian sector was 130 million tons oil equivalents (toe) in 1992, most of which was exported to markets in Europe. All this will ultimately be consumed, primarily through energy conversion processes, with release of CO_2 and other greenhouse emission gases. The current gas production of 26 million toe per year will increase rapidly during the coming ten years, while the present increase in oil production is expected to culminate in the same period. Reduction of atmospheric emissions from the Norwegian oil and gas industry may be achieved primarily through energy efficiency measures. Approximately 2.5% of the fossil fuel energy is consumed in the production and transportation process. Different environmental standards between producing nations will primarily affect production cost. The competitiveness of the various producing regions, rather than the overall environmental impact of the petroleum industry and its products, will be effected. 36 refs., 61 figs., 33 tabs.

22845 (UCRL-JC–109677) **Bacterial distribution and metabolic activity in subsurface sediments from a gasoline spill.** Krauter, P.W.; Hanna, M.L.; Taylor, R.T.; Rice, D.W. Jr. Lawrence Livermore National Lab., CA (United States). May 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920851–92: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93012505. Source: OSTI; NTIS; INIS; GPO Dep.

At the Lawrence Livermore National Laboratory (LLNL) in California, a records inspection in 1979 indicated an inventory of about 17,500 gal was missing from underground fuel tanks. A leak or leaks in the southernmost tank and/or pipe lines were suspected to be the source of the loss. All four tanks were taken out of service

and filled with sand in 1980. The gasoline spill cleanup effort affords an opportunity to study the collective effect of fuel hydrocarbons (HCs) on the indigenous microbial population within the heterogeneous alluvial subsurface environment. This paper presents the early results of an ongoing study to (1) characterize naturally acclimated microbial populations capable of transforming HCs and (2) understand the effects of environmental factors on these biotransformations.

22846 (DOE/MT/92012–3) **Evaluation of using cyclocranes to support drilling and production of oil and gas in wetland areas: Third quarterly technical progress report, First quarter, 1993.** Eggington, W.J. Mission Research Corp., San Diego, CA (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92012. Order Number DE93014605. Source: OSTI; NTIS; GPO Dep.

The planned program falls under wetlands area research related to drilling, production, and transportation of oil and gas resources. Specifically the planned program addresses an evaluation of using cyclocraft to transport drill rigs, mud, pipes and other materials and equipment in a cost effective and environmentally safe manner to support oil and gas drilling and production operations in wetland areas. The cyclocraft is a proven hybrid aircraft that utilizes aerostatic and aerodynamic lift. This type of aircraft has considerable payload capacity, VTOL capability, high controllability, low operating cost, low downwash and high safety. The benefits of using a cyclocraft to transport drill rigs and materials over environmentally-sensitive surfaces would be significant. The cyclocraft has considerable cost and operational advantages over the helicopter. The major activity during the report period was focussed on Task 4, Preliminary Design. The selected design has been designated H.1 Cyclocraft by MRC. The preliminary design work was based on the results of the three preceding tasks. A report was initiated that contains descriptions of the H.1 Cyclocraft and its subsystems; options available for the final aircraft design process; performance, geometry, weights and power data; logistics and considerations relating to cyclocraft operations in wetlands.

22847 (CONF-9207203–, pp. 65) **Spray characteristics in spray combustion.** Hiroyasu, H. (Hiroshima University, Hiroshima (Japan). Faculty of Engineering). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Study was made of spray characteristics influential on the combustion of liquid fuel. Because of non-luminous flame combustion without producing soot, introduction was made of not conventional swirling combustor but non-luminous flame combustor which jetted air flow from the baffle plate drilled with some ten nozzles and made it collide against a hollow-cone shape fuel spray. In the direct injection type diesel, the L/D (where L and D are length and diameter, respectively of the nozzle) influences the spray characteristics, and changes the fuel cost and total hydrocarbons contained in the exhaust gas. Particulates in the exhaust gas quantitatively reduced with heightening in injection pressure. The heightening of injection velocity above that in the turbulent flow region generally forms a spray region the surrounding portion of which is immediately atomized by touching the air. However, liquid inside the spray remains forming a liquid column which is vibrating. The length of that column shortens proportionally to the injection velocity. However above a certain injection velocity, no longer split occurs in spite of heightening of velocity and the liquid column remains of a constant length in the central portion. For the combustion, it is difficult to exactly optimize the particulate size distribution of spray as influenced by many factors. 4 refs., 7 figs.

Introduction was made of natural gas originating in igneous activity (magmatism). Green tuff (GT) stratum originates in a large scale volcanic activity on the seabed about 15 million years ago and forms the Sea of Japan's seaboard of Tohoku District. Natural gas (GT gas) produced there remarkably differs in contained He isotopes from that which biologically originates and is produced on the Pacific seaboard. 15 million years ago, the present western half of Japan's north-eastern part was submerged on the shallow seabed and there existed a large Graben lengthening from north to south. Along the central axis of that Graben. violent volcanic activity on the seabed produced lava with surface fractures, through which seawater penetrated. The Graben was buried under volcanic clastics containing seawater which was left intact of a high temperature state so that magmatic gas was confined in the clastics by a hydrostatic pressure of 1000m in sea depth. With a continuation of GT action by the igneous activity, mutual action proceeded between the rock and seawater during the geological elapsing of time, which then produced GT rock stratum. In parallel with it, CO2 contained in the magmatic gas finally changed into methane, which was so stored in the GT stratum as to form a very large natural gas layer. 2 refs., 1 fig., 1 tab.

22849 (CONF-9207203–, pp. 32-35) **Deep gas.** Hoshino, K. (Shimizu Construction Co. Ltd., Tokyo (Japan)). 22 Jul 1992. 320p. (In Japanese). Research was explained on non-conventional type natural gas which had become a conspicuous object of research with appearance of the theory that the natural gas originates in the inorganic methane. The natural gas (methane) which is being presently mined is mostly so-called oil-associated gas and founds the organic origination theory. However, entering the 1980's, attention was paid to the inorganic origination theory by Prof. Gold and Prof. Wakita. Intention which has recently become strong is to grasp the natural gas not only based on the inorganic gas hypothesis but also inclusively of natural gas existing or originating in the deep earth by investigating the actual conditions of geological deep earth structure and magmatic activity, and deep gas properties depending upon those conditions. For example, the deep gas is classified into abiogenic gas, subduction gas and deep sedimentary gas. Natural gas which is discussable both organically and inorganically was discovered in the deep earth of some of the existing gas fields in the US. In Europe, trace quantity of methane was discovered also in altered rock zones of the Precambrian Period. Research has started on the deep gas also in Japan. 13 refs.

22850 (CONF-9207203–, pp. 36-38) **Natural gas hydrate.** Okuda, Y. (Geological Survey of Japan, Tsukuba (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. Meeting. Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Out of natural gas hydrates existing underground, methane hydride is described. This is a sherbet-ice-state clathrate consisting of molecules of methane and water. It is said that methane obtained from the depth originates from biological fermentation, and that from the shallow place originates from thermal decomposition. In the sections recorded in marine seismic prospecting in the marginal region of the continent, reflection surfaces of strong amplitude called BSR (bottom simulating reflector) are often seen in parallel to the sea bottom surface and correspond to the bottom surface of the stable region of methane hydrate. Distribution of resources is expected in most of continental slopes inside the Pacific trench, continental slopes in the Atlantic-continental rises, and sea areas around the Antarctic Continent. BSR lies around 100-1100m below the sea bottom and some of it is confirmed by deepsea drilling. In the land area, it exists only inside the permafrost in Siberia, Canada and Alaska. In Japan it is said that it exists in slopes inside Nankai trough, the sea area of the offing of Tokachi-the offing of Hidaka, the offing of Tsugaru, etc. The worldwide amount of resource is several tens of trillion m^3in the land and several thousands of trillion m^3 in the sea.

22851 (CONF-9207203–, pp. 39-42) **Development of gas fields in arctic region.** Saka, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The paper describes exploration and development of oil and gas fields mainly in th arctic region. The region is under severe conditions such s ultra-low temperature down to -50°C, storm, sea ice, permafrost reaching down to several hundreds of meters underground and is very far from the existing infrastructure. Special specifications for the polar region are used for quality of materials and machinery. For safety, working facilities are as well as survival systems are perfectly shut out from outside, thermally insulated, and air-heated. For most of the pipelines and flow lines, freezing-prevention measures are taken such as thermally insulation and displacement of inert gas. Since the permafrost loses its bearing power of soil when it melts, the sites and roads are thermally insulated by gravel pads, and production modules are separated from the ground and installed on vertical support members. Drilling easing is designed to stand fracture loads using heat insulating materials and cushioning materials in order to prevent freezing fracture. Necessary facilities are separated in module for transportation, installation and assembly at sites which are very far. 1 fig., 1 tab.

22852 (DOE/MC/20422–3319) **Well log evaluation of natural gas hydrates.** Collett, T.S. Geological Survey, Denver, CO (United States). Oct 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI21-83MC20422. Order Number DE93000255. Source: OSTI; NTIS; GPO Dep.

Gas hydrates are crystalline substances composed of water and gas, in which a solid-water-lattice accommodates gas molecules in a cage-like structure. Gas hydrates are globally widespread in permafrost regions and beneath the sea in sediment of outer continental margins. While methane, propane, and other gases can be included in the clathrate structure, methane hydrates appear to be the most common in nature. The amount of methane sequestered in gas hydrates is probably enormous, but estimates are speculative and range over three orders of magnitude from about 100,000 to 270,000,000 trillion cubic feet. The amount of gas in the hydrate reservoirs of the world greedy exceeds the volume of known conventional gas reserves. Gas hydrates also represent a significant drilling and production hazard. A fundamental question linking gas hydrate resource and hazard issues is: What is the volume of gas hydrates and included gas within a given gas hydrate occurrence? Most published gas hydrate resource estimates have, of necessity, been made by broad extrapolation of only general knowledge of local geologic conditions. Gas volumes that may be attributed to gas hydrates are dependent on a number of reservoir parameters, including the areal extent ofthe gas-hydrate occurrence, reservoir thickness, hydrate number, reservoir porosity, and the degree of gas-hydrate saturation. Two of the most difficult reservoir parameters to determine are porosity and degreeof gas hydrate saturation. Well logs often serve as a source of porosity and hydrocarbon saturation data; however, well-log calculations within gas-hydrate-bearing intervals are subject to error. The primary reason for this difficulty is the lack of quantitative laboratory and field studies. The primary purpose of this paper is to review the response of well logs to the presence of gas hydrates.

22853 (ETDE/JP-mf–93794512, pp. 240-242) **Well stimulation technology.: Field experiment of massive hydraulic fracturing.** Sugiyama, H.; Nanba, T.; Onoe, S. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

A field test was performed on a hydraulic fracturing method applied to reservoir rocks comprising multi-lithofacies at great depths, as part of the special research program, 'well stimulation technology' at the Technology Development Center of Japan National Oil Corporation, which aims at establishing an integrated technology. This paper is a 1991 annual report describing evaluations on well capacity changes and fracture shapes after the fracturing (MHF) was carried out in the previous fiscal year at the Nagaoka gas field. As a result of conducting a three-point isochronal test in July 1991, nearly one year after the MHF implementation, and comparing the result with the test in the previous fiscal year, the well capacity was judged to have changed very little. With an objective of evaluating the fracture shapes, a long-term flow test was conducted after the above test, with a flow for 12 days and a shut-in for 40 days. As a result, the fracture length was inferred to be as short as 10 m as in the test immediately after the MHF. A second well for a verification test was selected from among the suspended wells. 3 figs.

22854 (ETDE/JP-mf–93794512, pp. 248-252) **Well stimulation technology.: Hydraulic fracturing for coal bed methane.** Onoe, S.; Sugiyama, H. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

Results of hydraulic fracturing in coal bed gas developing wells were discussed as part of the research program, 'well stimulation technology' at the Technology Development Center of Japan National Oil Corporation, which aims at establishing a hydraulic fracturing technology for naturally fractured reservoirs. This paper is a 1991 annual report describing the discussions which have been given while carrying out hydraulic fracturing tests at the Nagaoka gas field since 1988. An investigation work was commissioned in fiscal 1991 to Gaffney, Cline and Associates in the U.S.A. on the 'current status of coal bed methane gas development'. The investigation has provided a large number of useful information when referred to abnormal pressure phenomena that have been experienced in the previous tests. The information included investigations on patterns of abnormal behavior in hydraulic fracturing of coal beds and post-drilling of hydraulically fractured coal beds, and proposals on fracture designs. Studies on technology improvement will be moved forward based on these investigation results. In addition, it would be necessary to develop a simulator that can perform quantitative evaluation, for example. 2 figs.

Energy and the 70th Foundation Anniversary Meeting. Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Methane which is the main content of natural gas was taken up as base material. Study was done of a C2 hydrocarbon synthesis by supplying oxygen to it with the use of thin lead oxide membrane reactor. Lead oxide working effectively for the selective oxidative coupling reaction, lattice oxygen oxidatively dehydrogenates the methane and produces methyl radicals, which then produce C2 hydrocarbon through their bonding among themselves. Simultaneously supplied oxygen, though necessary for the reoxidation of methane-reduced lead, by-produces COx through oxidizing even the methyl radicals. A membrane reaction system was proposed to avoid it. An outer methane passage tube of porous support was slurry-coated with lead oxide catalyst film and sintered. Lattice oxygen is supplied by having oxygen pass inside the film and diffusing it by oxygen ion concentration gradient into the outer methane passage tube, which supply prevents COx from being by-produced by the passing oxygen and heightens the selectivity of reaction. The reaction speed could be expressed by a membrane reaction model which took both the reaction speed on surface and moving rate of oxygen inside film into consideration so that the membrane reaction system could be demonstrated in mechanism. 4 refs., 5 figs.

22856 (CONF-9207203–, pp. 51-54) **Development of low-temperature distillation process of methane.** Kurahashi, K. (Tokyo Gas Co. Ltd., Tokyo (Japan)); Nishiguchi, Y.; Haga, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Research was explained on the low temperature precision distillation/fraction of $^{13}CH4$ for the diversified utilization of LNG. The frequency of electromagnetic wave which has nuclear magnetic resonance occur is almost determined by the nuclear species and intensity of external magnetic field, and however, generates a minute gap (chemical shift) which reflects the value of electronic density around the atomic nucleus. The structure of organic compound and metabolism of biological tissue can be analyzed by using the chemical shift of ^{13}C-marked compound. Low cost ^{13}C is expected to be stably supplied. Diamond the raw material of which is ^{12}C is even 1.6 times as high as usual in thermal conductivity and gives an expectation of being applied to the semiconductor and laser. In the distillation/fraction and enrichment of ^{13}C, the theoretically necessary number of stages is large because of lowness in relative volatility (α). Pressure-reducing distillation was selected because of utilizing the fact that the α enlarges with lowering in temperature. By the pilot plant from raw methane of 500Nl/h, production was made of 95.0% concentricity $^{13}CH4$ of 0.4Nl/h and 99.9% concentricity $^{12}CH4$ of 5Nl/h with a possible recovery of residue as high purity methane.

22857 (DOE/PC/92111–T2) **Conversion of light hydrocarbon gases to metal carbides for production of liquid fuels and chemicals: Quarterly technical status report, January 1–March 31, 1993.** Diaz, A.F.; Modestino, A.J.; Howard, J.B.; Peters, W.A. Massachusetts Inst. of Tech., Cambridge, MA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92111. (FE-MIT–92111-2). Order Number DE93014962. Source: OSTI; NTIS; GPO Dep.

Work on this project will be performed according to two tasks: Task 1, Industrial Chemistry and Applied Kinetics of Light Hydrocarbon Gas Conversion to Metal Carbides H_2 and CO. We are building a laboratory-scale electric are discharge reactor, in which to assess the technical feasibility of producing Mg_2C_3, H_2, and CO from methane and MgO. We will also do experimental runs with CaO as well as mixtures of CaO and MgO and measure conversions of methane, CaO and/or MgO, and yields of Mg_2C_3, and/or CaC_2, H_2, and CO to identify the operating conditions of interest for implementing these reactions on a commercial scale. Reaction conditions and parameters will be chosen based on the previous work at MIT with CaO and CH, and on results of thermodynamic and thermochemical kinetics calculations. Task 2: Mechanistic Foundations-For Convertings Light Hydrocarbon Gases to Metal Carbides-H_2 and CO. We will evaluate the technical feasibility of carrying out methane reactions with CaO and MgO by thermal (e.g. 1500–2000°C) rather than under plasma conditions by performing experiments with the use of electrical screen heaters, heated tubular reactors, or other suitable apparatus. Extents and global rates of methane conversion, and yields as well as global production rates of CaC_2, Mg_2C_3, H_2 and CO will be measured upon subjecting mixtures of methane and CaO and/or MgO to high temperatures and controlled residence times. We will conduct hypothesis-testing of possible mechanistic pathways with selected experiments and perform reaction modeling to better understand the underlying chemical and physical processes that could influence process scale-up possibilities.

22858 (ETDE/JP-mf–93794512, pp. 437-448) **Direct conversion of natural gas to liquid fuel.** Suzuki, N.; Takehira, S.; Tada, Y.; Tezuka, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

A number of natural gas accumulating structures have been discovered recently in the southeastern Asia. In order to promote effective utilization of natural gas produced in such remote areas, developmental researches have been carried out since 1990 on processes to synthesize the major component of the gas, methane, into liquid fuel such as gasoline through direction conversion and polymerization processes. This paper is a report on the results obtained during the fiscal 1993. Based on the results achieved by the previous year, developments have been made on new catalysts for direct conversion and polymerization reactions utilizing methane's oxidation coupling reaction, and materials that can withstand high temperatures and corrosion under high-temperature oxidizing conditions in the oxidation coupling reaction. Among other results including discussion on high-temperature catalysts for a direct reaction of C1 → C2, for example, several types of natural calcium based catalysts including coral sand were found to have performance to satisfy the target. The result of a life test, however, showed that the catalysts have a time-based activity decreasing trend that should have been caused from sintering due to generated steam. 2 refs., 7 figs., 2 tabs.

22859 (SAND–92-2545) **Effects of cavern spacing on the performance and stability of gas-filled storage caverns.** Hoffman, E.L. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013497. Source: OSTI; NTIS; GPO Dep.

Three-dimensional finite element analyses of gas-filled storage caverns in domal salt were performed to investigate the effects of cavern spacing on surface subsidence, storage loss, and cavern stability. The finite element model used for this study models a seven cavern storage field with one center cavern and six hexagonally spaced surrounding caverns. Cavern spacing is described in

terms of the P/D ratio which is the pillar thickness (the width between two caverns) divided by the cavern diameter. With the stratigraphy and cavern size held constant, simulations were performed for P/D ratios of 6.0, 3.0, 2.0, 1.0, and 0.5. Ten year simulations were performed modeling a constant 400 psi gas pressure applied to the cavern lining. The calculations were performed using JAC3D, a three dimensional finite element analysis code for nonlinear quasistatic solids. For the range of P/D ratios studied, cavern deformation and storage volume were relatively insensitive to P/D ratio, while subsidence volume increased with increasing P/D ratio. A stability criterion which describes stability in terms of a limiting creep strain was used to investigate cavern stability. The stability criterion indicated that through-pillar instability was possible for the cases of P/D = 0.5 and 1.0.

Source: OSTI; NTIS; GPO Dep.

The Devonian oil shales of the Eastern United States are a significant domestic energy resource. The overall objective of the multi-year program, initiated in October 1987 by the US Department of Energy is to perform the research necessary to develop the Pressurized Fluidized-Bed Hydroretorting (PFH) process for producing oil from Eastern oil shales. The program also incorporates research on technologies in areas such as raw shale preparation, beneficiation, product separation, and waste disposal that have the potential of improving the economics and/or environmental acceptability of recovering oil from oil shales using the PFH process. The results of the original 3-year program, which was concluded in May 1991, have been summarized in a four-volume final report published by IGT. DOE subsequently approved a 1-year extension to the program to further develop the PFH process specifically for application to beneficiated shale as feedstock. Studies have shown that beneficiated shale is the preferred feedstock for pressurized hydroretorting. The program extension is divided into the following active tasks. Task 3. testing of process improvement concepts; Task 4. beneficiation research; Task 5. operation of PFH on beneficiated shale; Task 6. environmental data and mitigation analyses; Task 7. sample procurement, preparation, and characterization; and Task 8. project management and reporting. In order to accomplish all the program objectives, the Institute of Gas Technology (IGT), the prime contractor, worked with four other institutions: the University of Alabama/Mineral Resources Institute (MRI), the University of Kentucky Center for Applied Energy Research (UK-CAER), the University of Nevada (UN) at Reno, and Tennessee Technological University (TTU). This report presents the work performed during the program extension from June 1, 1991 through May 31, 1992.

22861 (DOE/MC/25045–3342) **Economic assessment of government-managed tar sand deposits in Utah: Final report.** Bunger, J.W. (Utah Univ., Salt Lake City, UT (United States)); Berry, C.W.; Devineni, P.A.V.; Deng, R. Department of the Interior, Washington, DC (United States); Utah Univ., Salt Lake City, UT (United States). Sep 1992. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI21-88MC25045. Order Number DE93000279. Source: OSTI; NTIS; INIS; GPO Dep.

In 1989 the US Department of the Interior asked the University of Utah to evaluate the economic potential of tar sand resources located in Utah. Particular emphasis was to be placed on tar sand resources located on Federal land. The primary purpose of this study was to provide the Federal government with information useful in developing policy, development programs, and in facilitating land management issues. Because these resources are valuable energy properties, many of which are owned by the Federal and State governments, development of these resources will not only contribute to domestic energy supplies but will provide revenues to the government. This study defines those areas in which impediments exist for development. Impediments may relate to physical characteristics of the deposit, state of technology development, product value, and markets. Impediments also may relate to institutional factors including legal, regulatory, and policy matters. Collectively, lack of critical information increases the investment risk factor. Investments are inhibited if there is a lack of definitive information in one or more critical areas. This study defines those areas of economic importance and a framework is established to help define remaining research and development requirements. Economic analysis has resulted in specific conclusions regarding the utilization of various deposits.

0409 Waste Management

22862 (UCRL-JC–110320-Pt.1) **Catalytic activity of oxidized (combusted) oil shale for removal of nitrogen oxides with ammonia as a reductant in combustion gas streams, Part 1.** Reynolds, J.G.; Taylor, R.W.; Morris, C.J. Lawrence Livermore National Lab., CA (United States). 10 Jun 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920815–22-Pt.1: 204. American Chemical Society (ACS) national meeting, Washington, DC (United States), 23-28 Aug 1992). Order Number DE93012587. Source: OSTI; NTIS; GPO Dep.

Oxidized oil shale from the combustor in the LLNL hot recycle solids oil shale retorting process has been studied as a catalyst for removing nitrogen oxides from laboratory gas streams using NH_3 as areductant. Combusted Green River oil shale heated at 10°C/min in an $Ar/O_2/NO/NH_3$ mixture (~93%/6%/2000 ppm/4000 ppm) with a gas residence time of ~0.6 sec exhibited NO removal between 250 and 500°C, with maximum removal of 70% at ~400°C. Under isothermal conditions with the same gas mixture, the maximum NO removal was found to be ~64%. When CO_2 was added to the gas mixture at ~8%, the NO removal dropped to ~50%. However, increasing the gas residence time to ~1.2 sec, increased NO removal to 63%. These results are not based on optimized process conditions, but indicate oxidized (combusted) oil shale is an effective catalyst for NO removal from combustion gas streams using NH_3 as the reductant.

22863 (DOE/MC/27401–3332) **A feasibility study of oil shale fired pulse combustors with applications to oil shale retorting: Final report.** Morris, G.J.; Johnson, E.K.; Zhang, G.Q.; Roach, R.A. West Virginia Univ., Morgantown, WV (United States). Dept. of Mechanical and Aerospace Engineering. Jul 1992. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-90MC27401. Order Number DE93000269. Source: OSTI; NTIS; GPO Dep.

The results of the experimental investigation performed to determine the feasibility of using pulverized Colorado oil shale to fuel a bench scale pulse combustor reveal that oil shale cannot sustain

pulsations when used alone as fuel. Trace amounts of propane mixed with the oil shale enabled the pulsations, however. Up to 80% of the organic material in the oil shale was consumed when it was mixed with propane in the combustor. Beyond the feasibility objectives, the operating conditions of the combustor fuel with propane and mixtures of oil shale and propane were characterized with respect to pulsation amplitude and frequency and the internal combustor wall temperature over fuel lean and fuel rich stoichiometries. Maximum pressure excursions of 12.5 kPa were experienced in the combustor. Pulsation frequencies ranged from 50 to nearly 80 Hz. Cycle resolved laser Doppler anemometry velocities were measured at the tail pipe exit plane. Injecting inert mineral matter (limestone) into the pulse combustor while using propane fuel had only a slight effect on the pulsation frequency for the feed rates tested.

22867 (POEF-T–3545) **Calculating atomic number densities for uranium compounds.** Taylor, R.W. Jr. (Battelle, Columbus, OH (United States)); Davis, T.C.; Newvahner, R.L. Portsmouth Gaseous Diffusion Plant, OH (United States). Jan 1993. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00001. Order Number DE93008985. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a set of standardized methods for calculating the densities of selected mixtures of uranium compounds and moderating materials. The mixtures specifically analyzed are: UO_2 and water, U_3O_8 and water, UF_6 and HF, and UO_2F_2 and water. The densities of the various isotopes (especially hydrogen and U-235) in such mixtures are important input parameters in nuclear criticality safety analyses. The use of a standardized set of methods for calculating the densities will promote consistency and comparability in criticality safety calculations. The equations used to determine the densities for the various mixtures of interest have been incorporated into a computer program to facilitate calculations. The computer program, NUMDEN, is written in FORTRAN and can calculate mixture densities, densities of each element, atomic number densities of each element and uranium isotope, the weight fractions of each element, and determine which of the resonance corrected cross sections for U-235 and U-238 from the 16-group Hansen Roach set should be used. Standard FORTRAN is used to allow the code to be compiled on a wide variety of platforms. The program can write output files that are compatible with KENO Va, KENO IV, or KENO PC.

22868 (UCRL-ID–113745) **Issues and recommendations related to replacement of CFC-114 at the uranium enrichment gaseous diffusion plant: Task title: Chlorofluorocarbon (CFC) Program Review, Final report, August 1, 1991–October 1, 1992.** Anderson, B.L.; Banaghan, E. Lawrence Livermore National Lab., CA (United States). 31 Mar 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014681. Source: OSTI; NTIS; INIS; GPO Dep.

The operating uranium enrichment gaseous diffusion plants (GDPs) in Portsmouth, Ohio and Paducah, Kentucky, which are operated for the United States Department for Energy by Martin Marietta Energy Systems (MMES), currently use a chlorofluorocarbon (CFC-114) as the primary process stream coolant. Due to recent legislation embodied in the Clean Air Act, the production of this and other related chlorofluorocarbons (CFCS) are to be phased out with no production occurring after 1995. Since the plants lose approximately 500,000 pounds per year of this process stream coolant through various leaks, the GDPs are faced with the challenge of identifying a replacement coolant that will allow continued operation of the plants. MMES formed the CFC Task Team to identify and solve the various problems associated with identifying and implementing a replacement coolant. This report includes a review of the work performed by the CFC Task Team, and recommendations that were formulated based on this review and upon original work. The topics covered include; identifying a replacement coolant, coolant leak detection and repair efforts, coolant safety concerns, coolant level sensors, regulatory issues, and an analytical decision analysis.

22869 (UCRL-LR–111984-93-1, pp. 1-3) **U-AVLIS program overview.** Lawrence Livermore National Lab., CA (United States). 1992. In *Isotope separation and advanced manufacturing technology: Semiannual report, April-September 1992, Volume 1, No. 1.* 32p. Order Number DE93006256. Source: OSTI; NTIS (US Sales Only).

The Uranium Enrichment Enterprise of the US Department of Energy (DOE) is vital to the fuel supply of nuclear power plants in the US and abroad. From the inception of the Uranium Atomic Vapor Laser Isotope Separation (U-AVLIS) Program, its purpose has been to provide the US with an enrichment technology that produces nuclear fuel at a lower cost than the current technologies - gaseous diffusion and gas centrifuge. The US role in the international uranium enrichment market has historically been important to this country for reasons of energy security, national security, technological leadership, economic competitiveness, balance of trade, safeguards and nonproliferation policies, and employment. Deployment of U-AVLIS can help us to achieve our policy objectives in these significant areas. Evolving market, economic, and technological forces all point to this country's need for a new, low-cost, environmentally clean uranium enrichment capability. An assessment of foreign competition, enrichment market demand, and the aging equipment in our existing gaseous diffusion plants indicates

that the US Uranium Enrichment Enterprise is likely to become increasingly less competitive beyond the mid-1990s. The overall objectives of the AVLIS Program are to develop, demonstrate, and document a uranium enrichment process capable of maintaining a competitive US Uranium Enrichment Enterprise in the long-term.

22870 (UCRL-LR–111984-93-1, pp. 4-9) **Production plant laser system conceptual design.** Lawrence Livermore National Lab., CA (United States). 1992. In *Isotope separation and advanced manufacturing technology: Semiannual report, April-September 1992, Volume 1, No. 1.* 32p. Order Number DE93006256. Source: OSTI; NTIS (US Sales Only).

A full conceptual design of a U-AVLIS production plant capable of producing ~1700 metric tons of enriched uranium per year has been accomplished as a first step in the deployment of AVLIS enrichment technology. This article describes the design of the plant laser system which is characterized by the work breakdown structure (WBS). The other major systems in the U-AVLIS production plant will be described in subsequent issues. The principal elements of the laser system for the U-AVLIS production plant are the copper laser system, tunable laser systems, beam transport systems, separator optical systems, and the laser buildings. The primary interfaces of the laser system are to the separator system and the control systems.

22871 (UCRL-LR–111984-93-1, pp. 10-15) **Beam quality improvements in copper vapor laser oscillators.** Lawrence Livermore National Lab., CA (United States). 1992. In *Isotope separation and advanced manufacturing technology: Semiannual report, April-September 1992, Volume 1, No. 1.* 32p. Order Number DE93006256. Source: OSTI; NTIS (US Sales Only).

The use of copper lasers in uranium isotope separation and other applications such as precision material processing would benefit from a near-diffraction-limited output beam. The simplest technique to improve the beam quality from high-gain and high-Fresnel-number laser media such as copper is to use a high-magnification unstable resonator. However, in such an oscillator cavity, only the latter part of the output pulse can reach the near-diffraction limit since only a small number of cavity round trips (typically 3 or 4) can be established during the 50- to 70-ns optical pulse. High-magnification unstable cavities also result in lower output powers and severe pulse temporal modulation, which are undesirable effects. In order to obtain a low beam-divergence output for the entire duration of the output pulse without significant power reduction, an injection-seeding configuration was implemented for the copper lasers in the Laser Demonstration Facility (LDF). In this configuration, the output of an unstable-resonator master oscillator (MO) with a magnification of M~15 is injected into a second unstable-resonator injection-locked oscillator (ILO) which also has a magnification of M~15. This particular injection scheme still has several shortcomings, however. It produces an ILO output beam with dual output modes; a beam divergence which is still far from diffraction limited (10-15 XDL), and undesired parasitic oscillation which results from intense injection feedback to the MO. An improved MO/ILO cavity and injection design is needed to resolve these issues. A parametric study was therefore done to analyze the effect of different cavity designs and alternate injection schemes on ILO output beam quality and power.

22872 (UCRL-LR–111984-93-1, pp. 16-20) **High-average power copper-pumped dye lasers.** Lawrence Livermore National Lab., CA (United States). 1992. In *Isotope separation and advanced manufacturing technology: Semiannual report, April-September 1992, Volume 1, No. 1.* 32p. Order Number DE93006256. Source: OSTI; NTIS (US Sales Only).

For several years, the AVLIS Program has been developing a kilowatt-class tunable laser system for isotopic separation of uranium. In order to produce an economically viable photoionization process, system considerations indicate the requirement for kilohertz-pulse repetition rates, near-diffraction-limited beam quality, accurate spectral control, and stable, long-term operation. The AVLIS dye laser system, the world's highest-average power, visible, tunable laser system, demonstrates all of these characteristics simultaneously.

22873 (UCRL-LR–111984-93-1, pp. 21-32) **Measurements of the thermal radiative properties of liquid uranium.** Havstad, M.A.; McLean, W. II; Self, S.A. Lawrence Livermore National Lab., CA (United States). 1992. In *Isotope separation and advanced manufacturing technology: Semiannual report, April-September 1992, Volume 1, No. 1.* 32p. Order Number DE93006256. Source: OSTI; NTIS (US Sales Only).

The thermal radiative properties of the surfaces of various metals at high temperature, both below and above the melting point, are important to a wide range of research and development activities, including laser isotope separation, laser welding, metal refining, electron-beam processing, and vacuum-arc remelting. These properties, namely the reflectivity, absorptivity, and emissivity, influence the energy balance and heat transfer in such applications and thereby determine performance and economic viability. Thermal radiative properties are often vital input data for heat transfer computations performed during development of a process. The accuracy of the input data determines the results of calculations that provide the understanding needed to make design changes and successfully complete development. The properties of uranium in particular have only rarely been measured, and then only over limited parameter ranges. Accurate information is required on the three surface radiative properties as a function of wavelength, temperature, and angle relative to the surface normal over an appropriately wide range of the latter three parameters. Studies of liquid metals are relatively rare. A review of the reported work in this area indicates a large scatter in the data and general lack of agreement between results of various workers. These discrepancies are probably caused by the difficulties in performing measurements on liquid metal surfaces, which are sufficiently free of impurities. Ultrahigh vacuum (UHV) conditions ~10^{-9} Torr are necessary because liquid metal surfaces are highly reactive.

22876 (ANL/FC/CP–76768) **Integral Fast Reactor fuel pin processor.** Levinskas, D. Argonne National Lab., Idaho Falls, ID (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930403–47: 5. topical meeting on robotics and remote systems, Knoxville, TN (United States), 26-29 Apr 1993). Order Number DE93009957. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the pin processor which receives metal alloy pins cast from recycled Integral Fast Reactor (IFR) fuel and prepares them for assembly into new IFR fuel elements. Either full

length as-cast or precut pins are fed to the machine from a magazine, cut if necessary, and measured for length, weight, diameter and deviation from straightness. Accepted pins are loaded into cladding jackets located in a magazine, while rejects and cutting scraps are separated into trays. The magazines, trays, and the individual modules that perform the different machine functions are assembled and removed using remote manipulators and master-slaves.

22877 (ANL/FC/CP–76869) **Advanced control system for the Integral Fast Reactor fuel pin processor.** Lau, L.D.; Randall, P.F.; Benedict, R.W.; Levinskas, D. Argonne National Lab., Idaho Falls, ID (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930403–45: 5. topical meeting on robotics and remote systems, Knoxville, TN (United States), 26-29 Apr 1993). Order Number DE93009976. Source: OSTI; NTIS; INIS; GPO Dep.

A computerized control system has been developed for the remotely-operated fuel pin processor used in the Integral Fast Reactor Program, Fuel Cycle Facility (FCF). The pin processor remotely shears cast EBR- reactor fuel pins to length, inspects them for diameter, straightness, length, and weight, and then inserts acceptable pins into new sodium-loaded stainless-steel fuel element jackets. Two main components comprise the control system: (1) a programmable logic controller (PLC), together with various input/output modules and associated relay ladder-logic associated computer software. The PLC system controls the remote operation of the machine as directed by the OCS, and also monitors the machine operation to make operational data available to the OCS. The OCS allows operator control of the machine, provides nearly real-time viewing of the operational data, allows on-line changes of machine operational parameters, and records the collected data for each acceptable pin on a central data archiving computer. The two main components of the control system provide the operator with various levels of control ranging from manual operation to completely automatic operation by means of a graphic touch screen interface.

22878 (ANL/FC/CP–78468) **Simplified probabilistic risk assessment in fuel reprocessing.** Solbrig, C.W. Argonne National Lab., Idaho Falls, ID (United States). Fuel Cycle Div. [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930404–13: International topical meeting on mathematical methods and supercomputing in nuclear applications (M&C+SNA '93), Karlsruhe (Germany), 19-23 Apr 1993). Order Number DE93009973. Source: OSTI; NTIS; INIS; GPO Dep.

An evaluation was made to determine if a backup mass tracking computer would significantly reduce the probability of criticality in the fuel reprocessing of the Integral Fast Reactor. Often tradeoff studies, such as this, must be made that would greatly benefit from a Probably Risk Assessment (PRA). The major benefits of a complete PRA can often be accrued with a Simplified Probabilistic Risk Assessment (SPRA). An SPRA was performed by selecting a representative fuel reprocessing operation (moving a piece of fuel) for analysis. It showed that the benefit of adding parallel computers was small compared to the benefit which could be obtained by adding parallelism to two computer input steps and two of the weighing operations. The probability of an incorrect material moves with the basic process is estimated to be 4 out of 100 moves. The actual values of the probability numbers are considered accurate to within an order of magnitude. The most useful result of developing the fault trees accrue from the ability to determine where significant improvements in the process can be made. By including the above mentioned parallelism, the error move rate can be reduced to 1 out of 1000.

22879 (CEA-CONF–11229) **Purex process improvements for the UP3 spent fuel reprocessing plant at La Hague, France.** Leudet, A. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Fournier, W.; Hugelmann, D.; Dalverny, G.; Bernard, C.; Miquel, P. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1990. [7p.] (CONF-9007123– : ISEC'90: international solvent extraction conference, Kyoto (Japan), 16-21 Jul 1990). Order Number DE93625344. Source: OSTI; NTIS (US Sales Only); INIS.

The UP3 reprocessing plant commissioned for active operation in November 1989 features numerous innovations both for the process flowsheet and the associated equipment. These innovations yielded positive results following initial active testing and are of considerable interest for solvent extraction specialists. This paper describes the main improvements introduced for the extraction cycles used to separate and purify uranium and plutonium. Specifically, these improvements include: adaptation of the first extraction cycle flowsheet for technetium decontamination and tritium confinement; solvent purification process based on distillation, a key element in the solvent system; flowsheets adapted for maximum recycling of liquid organic and mineral streams (solvent or nitric acid); use of annular or cylindrical pulsed columns with high-efficiency packing.

22880 (DOE/FTR–93013409) **Japanese chemical separations (partitioning) and transmutation activities: Foreign trip report, July 17–25, 1992.** Mellinger, G. Pacific Northwest Lab., Richland, WA (United States). 24 Aug 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013409. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The primary focus of partitioning research and development in Japan is to separate the non-uranium elements in spent fuel into four groups: (1) transuranics (TRUs), (2) Sr and Cs, (3) Tc and platinum group metals, and (4) others. The Power Reactor and Nuclear Fuel Development Corporation (PNC) is pursuing improvements in the PUREX process to allow extraction of Np as well as U and Pu in a first PUREX extraction cycle. PNC is developing the TRUEX process to extract Am, Cm and any higher actinides present in the PUREX raffinate. Current plans call for separation of Am and Cm from the lanthanides by a TALSPEAK-type process. The Japan Atomic Energy Research Institute is evaluating solvent extraction processes that are alternatives to TRUEX and TALSPEAK. Mitsubishi is evaluating the use of crystallization techniques for separating U from dissolved spent fuel and the use of "insoluble tannin" for removal of U and TRUs from nitric acid solutions. PNC is developing an electrolytic deposition process to recover platinum group metals plus Ag and Tc from spent fuel dissolver solution. A molten lead extraction process is also being developed to recover these elements from spent fuel dissolver residue. Brief descriptions of visits to the Tokai Vitrification Facility, Joyo experimental fast breeder reactor,and Monju prototype LMFBR reactor are included in the report. The primary area of interest to the US was solvent extraction technology for separating TRUs and other radionuclides from high-level waste (HLW). Other potential areas of interest included noble metals separations and advanced sequestering agents for TRU removal from HLW. A recommendation will be made to the DOE that a plan be formulated and presented to PNC for information exchange in these areas.

22881 (DOE/ID–10423) **Recycling of nuclear spent fuel with AIROX processing.** Majumdar, D. (ed.) (USDOE Idaho Field Office, Idaho Falls, ID (United States)); Jahshan, S.N.; Allison, C.M.; Kuan, P.; Thomas, T.R. USDOE Idaho Field Office, Idaho Falls, ID (United States). Dec 1992. 67p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012141. Source: OSTI; NTIS; INIS; GPO Dep.

This report examines the concept of recycling light water reactor (LWR) fuel through use of a dry-processing technique known as the AIROX (Atomics International Reduction Oxidation) process. In this concept, the volatiles and the cladding from spent LWR fuel are separated from the fuel by the AIROX process. The fuel is then reenriched and made into new fuel pins with new cladding. The feasibility of the concept is studied from a technical and high level waste minimization perspective.

22882 (DPW–3652) **Separations – denitration of UNH.** Evans, L.C. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Atomic Energy Div. 30 Oct 1951. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–520). Order Number DE93012048. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In 1951 a program was initiated to determine the suitability of recovered Purex UNH for further processing. As of October 30, 1951 all of the test UNH has been denitrated to UO_3 at the Mallinckrodt Chemical Works (MCW) in St. Louis. A small portion of the UO_3 was retained at MCW and converted to UO_2 than to UF_4. This UF_4 was to be converted to metal in the near future. The remaining and major portion of the UO was to be processed immediately at K-25 and evaluated for the diffusion process.

22883 (HW–43332) **Summary analysis of the Redox Plant sand filter radiation measurements.** Slater, R. E. Hanford Atomic Products Operation, Richland, WA (United States). 26 Mar 1956. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012368. Source: OSTI; NTIS (US Sales Only); GPO Dep.

"An Analysis of Redox Sand Filter Data," issued June 18, 1954, discussed increases in sand filter activity during the preceding six months, based upon air samples taken by Regional Radiation Measurement Unit of Radiological Sciences Department and upon vertical gamma radiation traverses (unshielded probe) made by the Redox Plant Radiation Monitoring Unit. "Estimated Activity in the Redox Sand Filter" dated July 15, 1954, were accurately defined the distribution of the activity within the sand filter by means of a radiation traverse with a partially shielded probe and by analyzing sand filter sand samples. Analysis of the shielded probe traverse data from the period following the last report through the most current data available reveals that the maximum radiation levels as measured by the shielded probe method were observed in July, 1954, and declined steadily, to an equilibrium, primarily from ruthenium decay.

22884 (INIS-mf–13503, pp. 215-220) **Total data management in the La Hague reprocessing plant.** Berthion, Y. (COGEMA/Etablissement de la Hague, Cherbourg (France)); Perot, J.P.; Silie, P. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Due to the complexity of a spent fuel reprocessing plant and its nuclear characteristics, the operators must have real-time access to updated information on many subjects. To meet these requirements effectively, Cogema has installed a number of diversified data processing systems linked by a communications network called Haguenet. The whole system forms the La Hague Total Data Management System (TDMS) which performs a full range of functions, namely production data management, maintenance data management, technical documentation and miscellaneous. Some examples of the main process data management applications implemented within the La Hague TDMS are briefly described (nuclear materials and waste follow-up, analytical data management, operating procedures management and site inspection management). Also presented are some examples of the maintenance-related systems implemented within the La Hague TDMS (diagnostic assistance system, software maintenance center, maintenance interventions demand and spare parts data management). (Z.S.).

22885 (JAERI–1328) **Demonstration test on the safety of a cell ventilation system during a hypothetical explosive burning in a fuel reprocessing plant.** Suzuki, Motoe (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nishio, Gunji; Takada, Junichi; Tsukamoto, Michio; Koike, Tadao. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1993. 104p. (In Japanese). Order Number DE93797595. Source: OSTI; NTIS; INIS.

To demonstrate the safety of an air ventilation system of cells in a fuel reprocessing plant under a postulated explosive burning caused by solvent fire or by thermal decomposition of nitrated solvent, four types of demonstration tests have been conducted using a large-scale facility simulating a cell ventilation system of an actual reprocessing plant, thus revealing effective mitigation by cell and duct structures on the pressure and temperature pulses generated by explosive burning. In boilover burning tests, solvent fire in a model cell was observed with various sizes of burning surface area as a main parameter, and analysis was performed on the factors dominating the magnitude of boilover burning, revealing that the magnitude strongly depends on accumulated amounts and their ratio of oxygen and solvent vapor present in the cell. In deflagration tests, solid rocket fuel was burned in the cell to simulate the explosive source. The generated pressure and temperature pulses were effectively declined by the cell and duct structures and the integrity of the ventilation system was kept. In blower tests, a centrifugal turbo blower was imposed by a lump of air with a larger flow rate than the rated one by about six times to observe the transient response of the blower fan and motor. It was found that integrity of the blower was kept. In pressure transient tests, compressed air was blown into the cell to induce a mild transient state of fluid dynamics inside the facility, and a variety of data were successfully obtained to be used for the verification and improvement of a computer code. In all the tests, transient overloading of gas caused no damage on HEPA filters, and overloading on the blower motor was avoided either by the slipping of transmission belt or by the acceleration of blower fan rotation during peak flow. (author).

22886 (JAERI-M–93-014) **Formation characteristics and its numerical models of the third phase in the U(IV)-HNO_3-TBP-n-dodecane system.** Ami, Norio (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Suzuki, Shinichi; Abe, Hiroshi; Tachimori, Shoichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 48p. (In Japanese). Order Number DE93797584. Source: OSTI; NTIS; INIS.

Extraction experiments were carried out to study characteristics of the third phase formation in the 30 % TBP-n-dodecane-U(IV)-HNO_3 system. The third phase is formed by mixing 10 ml of aqueous solution and 10 ml of TBP-n-dodecane. Volumes and concentrations of U(IV) and HNO_3 of the aqueous, light organic and the third phases were measured after an equilibrium. Concentrations of TBP, n-dodecane and H_2O in two organic phases were also measured. The numerical equations which calculate the volume and the concentrations of U(IV) and HNO_3 not only for the third phase but also for the light organic phase were deduced by the regression analysis method as functions of concentrations of U(IV) and HNO_3 in the initial aqueous solution. The results of present study are as follows: 1) U(IV) concentration and volume of the third phase increased from 70 to 190 g/l and from 1.5 to 3.5 ml, respectively, with increasing in U(IV) concentration of the initial aqueous solution, from 40 to 130 g/l. 2) There were good correlation between U(IV) concentration of the initial aqueous solution and U(IV) concentration of the third phase, and between volume of the third phase and U(IV) concentration of the initial aqueous solution. 3) The TBP concentrations of the third phase (50 to 80 %) were correlated to U(IV) (40 to 130 g/l) and HNO_3 concentrations (1.5 to 6 mol/l) of the initial aqueous solution. 4) The concentrations of U(IV) and HNO_3 in the equilibrium aqueous phase were equal to the values calculated with an equation for distribution ratio without taking into account the third phase formation. (author).

22887 (JAERI-M–93-019) **Large-scale demonstration tests of solvent fire and boilover burning during the fire in fuel-reprocessing plant.** Nishio, Gunji (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Suzuki, Motoe; Takada, Junichi; Koike, Tadao; Tukamoto, Michio. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 215p. (In Japanese). Order Number DE93797599. Source: OSTI; NTIS; INIS.

The demonstration test of solvent fire was performed in JAERI under auspices of the Science and Technology Agency to evaluate the safety of air-ventilation system in the event of hypothetical fire accident as DBA in a cell of the extraction process of the fuel-reprocessing plant of Japan. The demonstration test was carried out by focussing on fire behavior in the cell and HEPA filter plugging by smoke under a steady-state burning of solvent, using a large-scale test facility. Also a degree of the explosion due to a boilover burning during the fire was elucidated in the test. Test data in the report intend to use verify a computer code CELVA for the safety evaluation of air-ventilation system in the event of fire accident. (author).

22888 Plutonium recovery from spent reactor fuel by uranium displacement. Ackerman, J.P. To Dept. of Energy. 1991. Filed date 21 May 1991. USA patent application 7-703,641. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011998. Source: OSTI; NTIS; GPO Dep.

This report discusses a process for separating uranium values and transuranic values from fission products containing rare earth values when the values which are contained together in a molten chloride salt electrolyte. A molten chloride salt electrolyte with a first ratio of plutonium chloride to uranium chloride is contacted with both a solid cathode and an anode having values of uranium and fission products including plutonium. A voltage is applied across the anode and cathode electrolytically to transfer uranium and plutonium from the anode to the electrolyte while uranium values in the electrolyte electrolytically deposit as uranium metal on the solid cathode in an amount equal to the uranium and plutonium transferred from the anode causing the electrolyte to have a second ratio of plutonium chloride to uranium chloride. Then the solid cathode with the uranium metal deposited thereon is removed and molten cadmium having uranium dissolved therein is brought into contact with the electrolyte resulting in chemical transfer of plutonium values from the electrolyte to the molten cadmium and transfer of uranium values from the molten cadmium to the electrolyte until the first ratio of plutonium chloride to uranium chloride is re-established.

22889 (WINCO–1093-Del.Ver.) **ICPP Special Fuels Canning and Characterization Facility.** Sire, D.L.; Bendixsen, C.L.; Armstrong, E.F.; Henry, R.N.; Frandsen, G.B. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Apr 1992. 61p. Sponsored by USDOE, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93014821. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report examines the functional mission of a Special Fuels Canning and Characterization Facility (SFCCF) for the Idaho Chemical Processing Plant (ICPP) and presents justification for its implementation as part of Westinghouse Idaho Nuclear Co., Inc. (WINCO) long-range plans. The SFCCF would be built as the first phase of an overall facility for dispositioning special fuels. Issues related to feasibility, cost, and preconceptual design criteria are also discussed in this report. A preconceptual facility layout based on existing information was developed to enhance the preconceptual design criteria and support a rough order-of-magnitude cost estimate for the construction of the SFCCF. The US Department of Energy (DOE) is the landlord of a large quantity of spent nuclear fuel and related materials. A significant quantity of this inventory, approximately 730,000 kg total fuel mass, is labeled as "special fuel" because no specific processing technique and/or facility to disposition this material is available in the NMP complex. The dispositioning of this fuel is especially complex because of the variety of fuel types. Of these special fuels, approximately 90 %wt are stored at the INEL. Timely dispositioning of the fuels would avoid expenditures of funds for a second generation of storage facilities at the INEL and other DOE facilities and would demonstrate to the public that solutions to nuclear fuel dispositioning exist and that a plan is being executed. The SFCCF is required to characterize, verify the storage can contents, and, if necessary, recan the special fuels to help assure safe, interim storage (i.e. fission product containment and criticality control) until the special fuels processing facility is operating.

22890 (WSRC-TR–92-582-Rev.1) **Elucidation of noble metal/formic acid chemistry during DWPF feed preparation: Revision 1.** Landon, L.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1991]. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012791. Source: OSTI; NTIS; GPO Dep.

Eleven reports are included: evaluation of noble metal compounds as catalysts for aerobic decomposition of formic acid; reaction of $NaNO_3$ and $NaNO_2$ with formic acid under argon; effects of Ru, Rh, Pd chlorides on formic acid decomposition in presence of IDMS (pH=11.0) sludge; effects of additives on catalysts on decomposition of formic acid to hydrogen; Rh-catalyzed decomposition of formic acid; the question of whether this decomposition can be heterogeneous catalysis; inhibition of this reaction by additives; nitrilotriacetic acid inhibitor; uses of gelatin and other water soluble polymers to control flocculation rate; comparison of catalytic activities of Rh, Ru, Pd in Purex and HM sludges; experiments on homogeneous vs heterogeneous nature of Rh catalyst. Figs, refs, tabs.

22891 (CONF-930408–46) **Site and facility waste transport planning documents (SPDs) status and findings.** Schmid, S.P. (Science Applications International Corp., Oak Ridge, TN (United States)); Danese, F.L.; Wankerl, M.W. Oak Ridge National Lab., TN (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International high-level radioactive waste management conference; Las Vegas, NV (United States); 25-29 Apr 1993. Order Number DE93009721. Source: OSTI; NTIS; INIS; GPO Dep.

Site and Facility Waste Transportation Services Planning Documents (SPDS) are detailed desk-top reference documents that initiate planning for shipping commercial spent nuclear fuel (SNF) from the sites where it is currently generated and/or stored to another location. Because of the unique design features and individual variations in the spent fuel handling and cask loading operation requirements for each facility, one SPD will be written for each of the commercial facilities currently expected to deliver SNF into the Civilian Radioactive Waste Management System (CRWMS) disposal system. One primary purpose of an SPD is to initiate the discussions that will lead to a determination of the type of spent fuel cask and transport mode that will be used to transport spent fuel from each facility. The initial assessment of which cask type and mode would best serve each facility is based on the principle that the largest possible capacity casks should be used at the greatest number of facilities to reduce the total number of spent fuel shipments. The final selection of cask and transportation mode will be arrived at following discussion with the facility licensed operator. Once agreed upon by OCRWM and the facility owner, the SPD wig be used as a primary input to the development of a Site Specific Servicing Plan (SSSP) that will detail chosen servicing options for the individual site. This paper will discuss the purpose and development of SPDs and the preliminary results of an evaluation of the ability of delivering facilities to handle and ship spent fuel casks within the confines of the local nation infrastructure.

22892 (DOE/FTR–93012145) **[Meeting of the IAEA standing advisory group on safe transport of radioactive materials (SAGSTRAM)]: Foreign trip report, October 3–10, 1992.** Luna, R.E. Sandia National Labs., Albuquerque, NM (United States). 28 Oct 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012145. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This was the ninth meeting of SAGSTRAM, which is the primary advisory group to the IAEA on the conduct of their transportation safety program. At this meeting the author was an advisor to the DOE participant, F. P. Falci (EM-56). The meeting provided guidance to the Agency in many areas, but most important in this meeting were those associated with: the progress of the regulatory revision, interaction with the IMO on special requirements for ships carrying spent fuel,continuing changes to the LSA/LCO provisions in the regulations, and interactions with IAEA on the publication policy for transportation related documents.

22893 (DOE/LLW–160) **Savannah River Site offsite hazardous waste shipment data validation report.** Casey, C.; Kudera, D.E.; Page, L.A.; Rohe, M.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (INEL/MISC–93016). Order Number DE93012176. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of data validation is to verify that waste shipments reported in response to the US Department of Energy Headquarters (DOE-HQ) data request are properly categorized according to DOE-HQ definitions. This report documents all findings and actions resulting from the independent review of the Savannah River Site (SRS) data submittal and provides a summary of the SRS data submittal and data validation strategy. The overall hazardous waste management and offsite release process from 1987 through 1991 is documented along with an identification and description of the hazardous waste generation facilities. The SRS did not ship any hazardous waste offsite before 1987. Sampling and analysis and surface surveying procedures and techniques used in determining offsite releasability of the shipments are also described in this report.

Short communication. SPENT FUEL STORAGE/storage facilities; SLOVAK REPUBLIC; SPECIFICATIONS

22895 (NEA-CRP-L–338) **NEACRP comparison of codes for the radiation protection assessment of transportation packages. Solutions to problems 5 and 6.** Locke, H.F. UKAEA Atomic Energy Establishment, Winfrith (United Kingdom). Materials Technology Div. Mar 1992. [32p.] Order Number DE93626122. Source: OSTI; NTIS (US Sales Only); INIS.

The results for Problems 5 and 6 of the NEACRP code comparison as submitted by six participating countries are presented in summary. These problems concentrate on the prediction of the neutron and gamma-ray sources arising in fuel after a specified irradiation, the fuel being uranium oxide for problem 5 and a mixture of uranium and plutonium oxides for problem 6. In both problems the predicted neutron sources are in good agreement for all participants. For gamma-rays however there are differences, largely due to the omission of bremstrahlung in some calculations. This discrepancy occurs at low energies and is not significant for shielding calculations, although it would be important for predicting heating rates in some circumstances.

22896 (NEA-CRP-L–339) **Summary of the results of the comparison of calculations and measurements for the TN12 flask carried out under the NEACRP intercomparison of shielding codes.** Locke, H.F. UKAEA Atomic Energy Establishment, Winfrith (United Kingdom). Materials Technology Div. Mar 1992. [46p.] Order Number DE93626123. Source: OSTI; NTIS (US Sales Only); INIS.

Measurements of neutron and gamma-ray dose-rates made outside a TN-12 flask loaded with 12 PWR fuel elements were chosen as an experimental benchmark for the NEACRP Intercomparison of Codes. The results of calculations carried out by eight participants are compared with the measured dose-rates. The agreement is mostly very good for the dose-points at the mid-height of the flask, although at positions opposite the top and bottom of the fuel there are bigger discrepancies. The latter are attributed to the greater uncertainties in defining the sources and the shield materials in these regions. The study demonstrated the need to use an accurate response function for the dosimeter rather than assuming it to have a true dose response. One area of inconsistency in the conclusions drawn by participants was in the need for explicit modelling of the copper fins on the outside of the steel flask. Further work is needed to resolve this. Overall the comparison shows that the methods of calculation are accurate in most cases, and gives confidence in their application to flask design.

22897 (ORNL/CSD/FTR–4423) **[Travel to Japan for the 10th international symposium on the packaging and transportation of radioactive materials]: Foreign trip report, September 14, 1992–October 2, 1992.** Whitesides, G.E. Oak Ridge National Lab., TN (United States). 16 Oct 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012112. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report details a trip to Japan by an ORNL site manager. The purpose of the trip was to attend the 10th International Symposium on the Packaging and Transportation of Radioactive Materials (PATRAM '92) and to visit the Takai-mura facilities of the Japanese Atomic Energy Research Institute (JAERI), the Power Reactor and Nuclear Fuel Development Corporation (PNC), and the Nuclear Safety Research Association in Tokyo.

22898 (ORNL/FTR–4429) **[Safe transport of radioactive materials]: Foreign trip report, October 3–10, 1992.** Rawl, R.R. Oak Ridge National Lab., TN (United States). 26 Oct 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009924. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler participated in the ninth meeting of SAGSTRAM, the IAEA's senior advisory group on transportation safety matters. SAGSTRAM provides advice to the IAEA Director General concerning the direction and content of IAEA's transportation program. Several areas were discussed that have been identified as major issues related to the ongoing revision of the IAEA "Regulations for the Safe Transport of Radioactive Materials," Safety Series No. 6. Activities were initiated that will result in a complete revision of Safety Series No. 6 by 1996, and each major issue was reviewed to ensure that it will be adequately addressed during the revision process. Other aspects of the IAEA transportation program, such as information collection and coordinated research programs, were also reviewed, and advice was provided on future direction for these projects.

22899 (ORNL/FTR–4569) **[A trip to Austria to participate in the "Technical Committee on the Impact of the New ICRP Recommendations on the IAEA Regulations for the Safe Transport of Radioactive Materials"]: Foregin trip report, March 12–20, 1993.** Rawl, R.R. Oak Ridge National Lab., TN (United States). 5 Apr 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011561. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler participated in the second meeting of the IAEA Technical Committee TCM-M to consider the impacts of changes in the radiation protection recommendations of the International Commission on Radiological Protection (ICRP) on the IAEA transportation regulations. A few of the changes introduced in the new ICRP Publication 60 have the potential to cause significant impacts on the radiation protection-related approaches incorporated into the transport regulations. All of the new (or revised) ICRP recommendations were reviewed, and evaluations were made to determine if changes are needed in the transport regulations. In some cases, changes were needed; in others, justifications were developed for keeping the present transport requirements.

22900 (ORNL/TM–12090) **INTERLINE 5.0 – An expanded railroad routing model: Program description, methodology, and revised user's manual.** Johnson, P.E. (Oak Ridge National Lab., TN (United States)); Joy, D.S.; Clarke, D.B.; Jacobi, J.M. Oak Ridge National Lab., TN (United States). Mar 1993. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013471. Source: OSTI; NTIS; INIS; GPO Dep.

A rail routine model, INTERLINE, has been developed at the Oak Ridge National Laboratory to investigate potential routes for transporting radioactive materials. In Version 5.0, the INTERLINE routing algorithms have been enhanced to include the ability to predict alternative routes, barge routes, and population statistics for any route. The INTERLINE railroad network is essentially a computerized rail atlas describing the US railroad system. All rail lines, with the exception of industrial spurs, are included in the network. Inland waterways and deep water routes along with their interchange points with the US railroadsystem are also included. The network contains over 15,000 rail and barge segments (links) and over 13,000 stations, interchange points, ports, and other locations (nodes). The INTERLINE model has been converted to operate on an IBM-compatible personal computer. At least a 286 computer with a hard disk containing approximately 6 MB of free space is

recommended. Enhanced program performance will be obtained by using arandom-access memory drive on a 386 or 486 computer.

22901 (ORNL/TM–12124) **HIGHWAY 3.1: An enhanced HIGHWAY routing model: Program description, methodology, and revised user's manual.** Johnson, P.E. (Oak Ridge National Lab., TN (United States)); Joy, D.S.; Clarke, D.B.; Jacobi, J.M. Oak Ridge National Lab., TN (United States). Mar 1993. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013472. Source: OSTI; NTIS; GPO Dep.

The HIGHWAY program provides a flexible tool for predicting highway routes for transporting radioactive materials in the United States. The HIGHWAY data base is essentially a computerized road atlas that currently describes over 240,000 miles of highways. Complete descriptions of all Interstate System and most US highways (except those that parallel a nearby Interstate highway) are included in the data base. Many of the principal state highways and a number of local and county highways are also identified. The data base also includes locations of nuclear facilities and major airports. Several different types of routes may be calculated, depending on a set of user-supplied constraints. Routes are calculated by minimizing the total impedance between the origin and the destination. Basically, the impedance is defined as a function of distance and driving time along a particular highway segment. Several routing constraints can be imposed during the calculations. One of the special features of the HIGHWAY model is its ability to calculate routes that maximize use of Interstate System highways. This feature allows the user to predict routes for shipments of radioactive materials that conform to the US Department of Transportation routing regulations. Other features of the model include the ability to predict routes that bypass a specific state, city, town, or highway segment. Two special features have been incorporated in HIGHWAY, version 3.1. The first is the ability to automatically calculate alternative routes. Frequently, there are a number of routes between the source and destination that vary slightly in distance and estimated driving time. The HIGHWAY program offers a selection of different but nearly equal routes. The second special feature is the capability to calculate route-specific population density statistics. The population density distribution is calculated for each highway segment in the route and is reported on a state-by-state basis.

22902 (PNL-SA–21727) **Status of work at PNL supporting dry storage of spent fuel.** Cunningham, M.E.; McKinnon, M.A.; Michener, T.E.; Thomas, L.E.; Thornhill, C.K. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930182–1: 10. Institute of Nuclear Materials Management spent fuel management seminar, Washington, DC (United States), 13-15 Jan 1993). Order Number DE93007879. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses three projects related to dry storage of light-water reactor spent fuel which are being conducted at Pacific Northwest Laboratory. Performance testing of six dry storage systems (four metal casks and two concrete storage systems) has been completed and results compiled. Two computer codes for predicting spent fuel and storage system thermal performance, COBRA-SFS and HYDRA-II, have been developed and have been reviewed by the US Nuclear Regulatory Commission. Air oxidation testing of spent fuel was conducted from 1984 through 1990 to obtain data to support recommendations of temperature-time limits for air dry storage of spent light-water reactor fuel.

22903 (SAND–93-0469C) **Waste minimization/pollution prevention at R&D facilities: A cradle-to-grave tracking and information system for Sandia National Laboratories.** Kjeldgaard, E.A.; Gillenwater, M.W. Sandia National Labs., Albuquerque, NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930483–2: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993). Order Number DE93011578. Source: OSTI; NTIS; INIS; GPO Dep.

Critical information required for Environment, Safety, and Health (ES&H) protection can be acquired with a comprehensive cradle-to-grave tracking and information system. The cradle-to-grave concept makes two initial assumptions. First, it is more effective to gather information at the origination of a process or entry point of a material and maintain that information during the rest of its life-cycle than to collect data on an ad hoc basis. Second, the information needs of the various ES&H programs have many commonalties. A system which adheres to a methodology based upon these assumptions requires a significant technical and administrative commitment; however, this investment, will in the long-term, reduce the effort and duplication of ES&H programs, improve the efficiency of ES&H and line personnel, and increase the scope and accuracy of ES&H data. The cradle-to-grave system being developed at Sandia National Laboratories (SNL) is designed to provide useful information on materials, personnel, facilities, hazards, wastes, and processes to fulfill the mission of pollution prevention, risk management, industrial hygiene, emergency preparedness, air/water quality, and hazardous and radioactive waste management groups. SNL is currently linking system modules, which are at various stages of development and production, to realize a cradle-to-grave tracking and information system that is functional for a large research and development laboratory.

22904 (UCRL-ID–110445) **A guide for thermal testing transport package for radioactive material: Hypothetical accident conditions.** VanSant, J.H.; Carlson, R.W.; Fischer, L.E.; Hovingh, J. Lawrence Livermore National Lab., CA (United States). 9 Feb 1993. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93008624. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides guidelines for planning, conducting, and reporting thermal tests on transport packages for radioactive material. Test conditions and acceptance criteria are for the hypothetical accident conditions specified in Part 71 of Title 10 Code of Federal Regulations (10 CFR 71). All type B packages for transport of radioactive material must be tested to these conditions, by physical or analytical test, and meet the acceptance criteria for certification by a U.S. regulatory agency as being in compliance with federal safety standards. The principal objective of this Thermal Test Guide (TTG) is to provide an applicant with general recommendations for development of a physical test program. Also, the TTG is in accord with the general philosophy for reviewing safety analysis reports for packaging and provides a common basis for applicants and reviewers. As there can be a large variety of package designs, the TTG is not all-inclusive. An applicant should appropriately apply the TTG to ensure acceptable test conditions and results for a particular package design. Recommended test conditions are based on a proposed ruling of 10 CFR 71 that was published in the US Federal Register. Thermal test conditions in the proposed ruling exceed those specified in the current ruling. Also, they are effectively equivalent to thermal test conditions specified by the International Atomic Energy Agency (IAEA) for Type B packages. Thus, by following the TTG recommendations, an applicant would be assured of meeting future 10 CFR 71 requirements and also complying with IAEA requirements.

22905 (UCRL-JC–110999) **Truck accident involving unirradiated nuclear fuel.** Carlson, R.W.; Fischer, L.E. Lawrence Livermore National Lab., CA (United States). Jul 1992. 5p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9207102–77: Institute of Nuclear Materials Management (INMM) annual meeting, Orlando, FL (United States), 19-22 Jul 1992). Order Number DE93012488. Source: OSTI; NTIS; INIS; GPO Dep.

In the early morning of Dec. 16, 1991, a severe accident occurred when a passenger vehicle traveling in the wrong direction collided with a tractor trailer carrying 24 nuclear fuel assemblies in 12 containers on Interstate 1-91 in Springfield, Massachusetts. This paper documents the mechanical circumstances of the accident and the physical environment to which the containers were exposed and the response of the containers and their contents. The accident involved four impacts where the truck was struck by the car, impacted on the center guardrail, impacted on the outer concrete barrier and came to rest against the center guardrail. The impacts were followed by a fire that began in the engine compartment, spread to the.tractor and cab, and eventually spread to the trailer and payload. The fire lasted for about three hours and the packages were involved in the fire for about two hours. As a result

of the fire, the tractor-trailer was completely destroyed and the packages were exposed to flames with temperatures between 1300°F and 1800°F. The fuel assemblies remained intact during the accident and there was no release of any radioactive material during the accident. This was a very severe accident; however, the injuries were minor and at no time was the public health and safety at risk.

22906 (WHC-SA–1414) **Uranium hexafluoride packaging tiedown systems overview at Portsmouth Gaseous Diffusion Plant, Piketon, Ohio.** Becker, D.L.; Lindquist, M.R. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930702–20: Pressure vessel and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93013001. Source: OSTI; NTIS; INIS; GPO Dep.

The Portsmouth Gaseous Diffusion Plant (PORTS) in Piketon, Ohio operated by Martin Marietta Energy Systems, Inc., through the US Department of Energy-Oak Ridge Operations Office (DOE-ORO) for the US Department of Energy Headquarters, Office of Nuclear Energy. The PORTS conducts those operations that are necessary for the production, packaging, and shipment of enriched uranium hexafluoride (UF_6). Uranium hexafluoride enriched greater than 1.0 wt percent ^{235}U shall be packaged in accordance with the US Department of Transportation (DOT) regulations of Title 49 CFR Parts 173 (Reference 1) and 178 (Reference 2), or in US Nuclear Regulatory Commission (NRC) or US Department of Energy (DOE) certified package designs. Concerns have been expressed regarding the various tiedown methods and condition of the trailers being used by some shippers/carriers for international transport of the UF_6 cylinders/overpacks (Reference 3). Because of the concerns about international shipments, the US Department of Energy-Headquarters (DOE-HQ) Office of Nuclear Energy, through DOE-HQ Transportation Management Division, requested Westinghouse Hanford Company (Westinghouse Hanford) to review UF_6 packaging tiedown and shipping practices used by PORTS, and where possible and appropriate, provide recommendations for enhancing these practices. Consequently, a tram of two individuals from Westinghouse Hanford visited PORTS on March 5 and 6, 1990, for the purpose of conducting this review. The paper provides a brief discussion of the review activities and a summary of the resulting findings and recommendations. A detailed reporting of the review is documented in Reference 4.

22907 (WHC-SA–1867) **Risk management of onsite transportation of nuclear waste.** Field, J.G.; Wang, O.S.; Mercado, J.E. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930608–2: Safewaste '93: the final disposal of nuclear waste, Avignon (France), 14-18 Jun 1993). Order Number DE93011352. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy (DOE) Hanford Site recently has undergone a significant change in mission. The focus of operations has shifted from plutonium production to environmental restoration. This transition has caused a substantial increase in quantities of nuclear waste and other hazardous materials packaged and transported onsite. In response to the escalating transportation activity, Westinghouse Hanford Company (Westinghouse Hanford), the Hanford Site operations and engineering contractor, is proposing an integrated risk assessment methodology and risk management strategy to enhance the safety of onsite packaging and transportation operations involving nuclear waste. The proposed methodology consists of three integral parts: risk assessment, risk acceptance criteria, and risk minimization. The purpose of the methodology is to ensure that the risk for each ongoing transportation activity is acceptable and to minimize the overall risk for current and future onsite operations.

22908 (WSRC-TR–93-001) **P-V-T-C accuracy for RTF metal hydride bed callbration.** Klein, J.E. Westinghouse Savannah River Co., Aiken, SC (United States). 15 Jan 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013693. Source: OSTI; NTIS (US Sales Only); GPO Dep.

SRCT was asked to determine the accuracy of pressure-volume temperature-composition (P-V-T-C) calculations for the RTF mix tanks so bed loading accuracies for the in-bed accountability (IBA) Test Acceptance Criteria for RTF start-up could be defined. To meet the 4-to-1 calibration accuracy ratio (CAR) requirement for the hydride beds, the uncertainties in the P-V-T-C calculations needed to be four times greater than tritium measurement uncertainty using the IBA technique. To meet the 4-to-1 CAR for the two "large size" RTF metal hydride storage beds, only procedural changes are needed to raise the CAR from 2.5-to-1 to 4.4-to-1. It is recommended that the large size bed IBA calibration procedures be revised to use the method described in this report. For the "normal size" hydride beds, the 4-to-1 CAR can not be met with the current equipment, and three options for RTF start-up are available: first, obtain a waiver to approve a CAR of 1.6-to-1; second, improve the CAR to 3.3-to-1 by temporary use (during IBA calibrations) of a lower pressure range (1000 torr), high accuracy (± 1.5 torr), pressure transducer for 1500 L RTF mix tank pressures (waiver still required); and third, improve the CAR to 4.4-to-1 by temporary use (during IBA calibrations) of a lower pressure range (1000 torr), high accuracy (± 1.5 torr), pressure transducer for the 1000 L RTF mix tank pressures (waiver not required). Option one is undesirable due to its low accuracy, while option three, the calibration of the six normal size hydride beds using the one 1000 L mix tank, will take longer than is practical based on the RTF start-up schedule. It is recommended that 1000 ± 1.5 torr pressure transducers be temporarily used on the 1500 L mix tanks for IBA calibrations of the normal size beds and a waiver be requested justifying a CAR of 3.3-to-1.

22909 (ANL/EAIS/TM–88) **Analysis of the formation, expression, and economic impacts of risk perceptions associated with nuclear facilities.** Allison, T.; Hunter, S.; Calzonetti, F.J. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Oct 1992. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93010594. Source: OSTI; NTIS; INIS; GPO Dep.

This report investigates how communities hosting nuclear facilities form and express perceptions of risk and how these risk perceptions affect local economic development. Information was collected from site visits and interviews with plant personnel, officials of local and state agencies, and community activists in the hosting communities. Six commercial nuclear fuel production facilities and five nuclear facilities operated for the US Department of Energy by private contractors were chosen for analysis. The results presented in the report indicate that the nature of risk perceptions depends on a number of factors. These factors are (1) level of communication by plant officials within the local community, (2) track record of the facility. operator, (3) process through which community and state officials receive information and form opinions, (4) level of economic links each plant has with the local community, and (15) physical characteristics of the facility itself. This report finds that in the communities studied, adverse ask perceptions have not affected business location decisions, employment levels in the local community, tourism, or agricultural development. On the basis of case-study findings, this report recommends that nuclear facility siting programs take the following observations into account when addressing perceptions of risk. First, the quality of a facility's participation with community activists, interest groups, and state agencies helps to determine the level of perceived risk within a community. Second, the development of strong economic links between nuclear facilities and their host communities will produce a higher level of acceptance of the nuclear facilities.

22910 (SR/H–526) **[Hanford Department Histories]: Village Operation, Part 2.** Plant Histories. Hanford Engineer Works, Richland, WA (United States). [1946]. 132p. 22911 (ANL/CMT/CP–77655) **Study on the colloids generated from testing of high-level nuclear waste glasses.** Feng, X.; Buck, E.C.; Mertz, C.; Bates, J.K.; Cunnane, J.C.; Chaiko, D.J. Argonne National Lab., IL (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930205–18: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93008655. Source: OSTI; NTIS; INIS; GPO Dep.

The generation of colloids in the interaction of high-level nuclear waste glasses with groundwater at 90°C has been investigated. The stability of the colloidal suspensions has been characterized with respect to salt concentration, pH time, particle size, and zeta potential. The compositions and the morphology of the colloids have also been determined with transmission electron microscopy (TEM). From ourtest results combined with earlier ones, we conclude that the waste glass may contribute to the colloid formation by increasing ion concentration in groundwater, which causes nucleation of colloids; by releasing radionuclides that adsorb onto existing groundwater colloids; and by spalling colloidal-size fragments from the surface layer of the reacted glass. The colloids are silicon-rich particles, such as smectites and uranium silicates. When the salt concentration in the solution is high the colloidal suspensions agglomerate. However, the agglomerated particles can be resuspended if the salt concentration is lowered by dilution with groundwater. The colloids agglomerate quickly after the leachate is cooled to room temperature. Most of the colloids settle out of the solution within a few days at ambient temperature. The isoelectric point is at a pH of approximately 1.0. Between pH 1 and 10.5, the colloids are negatively charged, which suggests that they will deposit readily on, positively charged surfaces. The average particle size islargest at the isoelectric point and is smallest around pH 6.

22912 (ANL/CMT/CP–79163) **Factors influencing chemical durability of nuclear waste glasses.** Feng, Xiangdong; Bates, J.K. Argonne National Lab., IL (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9303134–1: 9. international conference on advanced science and technology, Schaumburg, IL (United States), 27 Mar 1993). Order Number DE93009983. Source: OSTI; NTIS; INIS; GPO Dep.

A short summary is given of our studies on the major factors that affect the chemical durability of nuclear waste glasses. These factors include glass composition, solution composition, SA/V (ratio of glass surface area to the volume of solution), radiation, and colloidal formation. These investigations have enabled us to gain a better understanding of the chemical durability of nuclear waste glasses and to accumulate.a data base for modeling the long-term durability of waste glass, which will be used in the risk assessment of nuclear waste disposal. This knowledge gained also enhances our ability to formulate optimal waste glass compositions.

22913 (ANL/CMT/CP–79523) **Applications of microwave radiation environmental remediation technologies.** Krause, T.R.; Helt, J.E. Argonne National Lab., IL (United States). Chemical Technology Div. [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930438–12: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012903. Source: OSTI; NTIS; INIS; GPO Dep.

A growing number of environmental remediation technologies (e.g., drying, melting, or sintering) utilize microwave radiation as an integral part of the process. An increasing number of novel applications, such as sustaining low-temperature plasmas or enhancing chemical reactivity, are also being developed. An overview of such technologies being developed by the Department of Energy is presented. A specific example being developed at Argonne National Laboratory, microwave-induced plasma reactors for the destruction of volatile organic compounds, is discussed in more detail.

22914 (ANL/EAIS/CP–78642) **Managing nuclear waste: Social and economic impacts.** Hemphill, R.C. (Argonne National Lab., IL (United States)); Bassett, G.W. Jr. Argonne National Lab., IL (United States); Chicago Univ., IL (United States). Dept. of Economics. [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930408–54: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93009953. Source: OSTI; NTIS; INIS; GPO Dep.

Recent research has focused on perceptions of risk dominant source of economic impacts due to siting a high level radioactive waste facility. This article addresses the social and economic considerations involved with the issue of risk perception and other types of negative imagery. Emphasis is placed on ways of measuring the potential for economic effects resulting from perceptions prior to construction and operation of a HLW facility. We describe the problems in arriving at defensible estimates of economic impacts. Our review has found that although legal and regulatory bases may soon allow inclusion of these impacts in EIS and for compensation purposes, credible scientific methods do not currently exist for predicting the existence or magnitude of changes in economic decision-making. Policy-makers should recognize the potential for perception-based economic impacts in determining the location and means of managing radioactive waste; but, they also need be cognizant of the current limitations of quantitative estimates of impacts in this area.

22915 (ANL/EAIS/TM–89) **Postremediation dose assessment for the Elza Gate site, Oak Ridge, Tennessee.** Nimmagadda, M.; Yu, C. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Mar 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011504. Source: OSTI; NTIS; GPO Dep.

Potential maximum radiation dose rates were calculated for the Elza Gate site in Oak Ridge, Tennessee. The RESRAD computer code, which implements the methodology described in the US Department of Energy's manual for implementing residual radioactive material guidelines, was used in this evaluation. Currently, the site is not being used. Four potential future use scenarios were considered for the Elza Gate site; the scenarios vary with regard to time spent at the site, sources of water used, and sources of food consumed. In Scenario A (the expected scenario), industrial use of the site is assumed; in Scenario B (a plausible scenario), recreational use of the site is assumed. Both Scenarios C and D (possible but unlikely scenarios) assume the presence of a resident farmer in the immediate vicinity of the site. The difference between Scenarios C and D is the source of water used. For Scenario C, an adjacent pond provides 100% of the water for drinking, irrigation, and raising livestock; for Scenario D, groundwater drawn from a well located at the downgradient edge of the contaminated zone is the only source of water for drinking, investigation, and raising livestock. The results of the evaluation indicate that the US Department of Energy dose limit of 100 mrem/yr would not be exceeded for any scenario. The potential maximum dose rates for Scenarios A, B, C, and D are 1.5, 0.66, 12, and 42 mrem/yr, respectively.

22916 (ANL/MCT/CP–75243) **Crack growth behavior of candidate waste container materials in simulated underground water.** Park, J.Y.; Shack, W.J.; Diercks, D.R. Argonne National Lab., IL (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921119–3: American Society for Testing and Materials (ASTM) symposium on application of accelerated corrosion tests to life prediction of materials, Miami, FL (United States), 16-17 Nov

1992). Order Number DE93008648. Source: OSTI; NTIS; INIS; GPO Dep.

Fracture-mechanics crack growth tests were conducted on 25.4-mm-thick compact tension specimens of Types 304L and 316L Stainless steel and Incoloy 825 at 93°C and 1 atmosphere of pressure in simulated J-13 well water, which is representative of the groundwater at the Yucca Mountain site in Nevada that is proposed for a high-level nuclear waste repository. Crack growth rates were measured under various load conditions: load ratios of 0.2–1.0, frequencies of 2×10^{-4}–1 Hz, rise times of 1–5000 s, and peak stress intensities of 25–40 MPa·m$^{\frac{1}{2}}$. The measured crack growthrates are bounded by the predicted rates from the current ASME Section 11 correlation for fatigue crack growth rates of austenitic stainless steel in air. Environmentally accelerated crack growth was not evident in any of the three materials under the test conditions investigated.

22917 (ASD-NMP–93-0014) **Implementation impacts of PRL methodology.** Caudill, J.A.; Krupa, J.F.; Meadors, R.E.; Odum, J.V.; Rodrigues, G.C. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013659. Source: OSTI; NTIS; INIS; GPO Dep.

This report responds to a DOE-SR request to evaluate the impacts from implementation of the proposed Plutonium Recovery Limit (PRL) methodology. The PRL Methodology is based on cost minimization for decisions to discard or recover plutonium contained in scrap, residues, and other plutonium bearing materials. Implementation of the PRL methodology may result in decisions to declare as waste certain plutonium bearing materials originally considered to be a recoverable plutonium product. Such decisions may have regulatory impacts, because any material declared to be waste would immediately be subject to provisions of the Resource Conservation and Recovery Act (RCRA). The decision to discard these materials will have impacts on waste storage, treatment, and disposal facilities. Current plans for the de-inventory of plutonium processing facilities have identified certain materials as candidates for discard based upon the economic considerations associated with extending the operating schedules for recovery of the contained plutonium versus potential waste disposal costs. This report evaluates the impacts of discarding those materials as proposed by the F Area De-Inventory Plan and compares the De-Inventory Plan assessments with conclusions from application of the PRL. The impact analysis was performed for those materials proposed as potential candidates for discard by the De-Inventory Plan. The De-Inventory Plan identified 433 items, containing approximately 1% of the current SRS Pu-239 inventory, as not appropriate for recovery as the site moves to complete the mission of F-Canyon and FB-Line. The materials were entered into storage awaiting recovery as product under the Department's previous Economic Discard Limit (EDL) methodology which valued plutonium at its incremental cost of production in reactors. An application of Departmental PRLs to the subject 433 items revealed that approximately 40% of them would continue to be potentially recoverable as product plutonium.

22918 (BfS-ET–14/92-REV-1) **Requirements on radioactive wastes to be disposed and measures for product control of radioactive wastes - Morsleben repository for radioactive wastes (ERAM) - as of November 1992.** Kugel, K. (Bundesamt fuer Strahlenschutz, Braunschweig (Germany). Fachbereich Nukleare Entsorgung und Transport); Noack, W.; Bard, C.; Giller, H.; Martens, B.R. Bundesamt fuer Strahlenschutz, Salzgitter (Germany). Mar 1993. 107p. (In German). Order Number DE93795327. Source: OSTI; NTIS (US Sales Only); INIS.

The waste categories 'solid wastes' and 'sealed sources' can be emplaced in the Morsleben repository (ERAM). The requirements on the wastes to be disposed of must be fulfilled by the waste producer upon delivery of the wastes. Concerning solid wastes, requirements on the waste forms and activity limitations for radionuclides and radionuclide groups must be fulfilled. Furthermore, requirements on packagings must be kept. Concerning sealed sources, basic requirements must be fulfilled and activity limitations depending on their packaging must be kept. Some radionuclides contained in the wastes must be indicated. The fulfilment of the requirements on radioactive wastes to be disposed of is proved within the framework of the waste package quality control. Organizational and administrative regulations and the check and control measures performed within the framework of the waste package quality control are described. The fulfilment of the requirements is proved by the qualification of conditioning procedures and following independent control measures performed during conditioning or by a random sampling inspection of waste packages. Furthermore, independent control measures at waste containers are performed. (orig.).

22919 (BfS-ET–17/93) **Amount of radioactive wastes in the Federal Republic of Germany - waste inquiry for the year 1991.** Hollmann, A.; Brennecke, P. Bundesamt fuer Strahlenschutz, Braunschweig (Germany). Fachbereich Nukleare Entsorgung und Transport. Feb 1993. 29p. (In German). Order Number DE93792571. Source: OSTI; NTIS (US Sales Only); INIS.

On behalf of the Ministry for Environment, Nature Conservation and Nuclear Safety the amount of radioactive wastes arising in the Federal Republic of Germany is surveyed every year by the Federal Office for Radiation Protection (BfS). This survey includes residues and primary wastes, as well as the amounts of arising and already existing conditioned wastes, and, moreover, a prognosis for the following year. It comprises the results of this investigation for the year 1991 and a prognosis for the radioactive waste to be expected in the future up to and including the year 2000, as well as considerations concerning the capacity of interim waste storages at the institutions liable to hand in their waste. For the time being BfS pursues the Konrad and Gorleben repository projects. Additionally, the Morsleben repository (ERAM) is prepared for the emplacement of radioactive wastes with comparably low-alpha activities. (orig.).

22920 (BNL–48607) **Polyethylene encapsulation of single shell tank low-level wastes.** Kalb, P.D.; Fuhrmann, M.; Colombo, P. Brookhaven National Lab., Upton, NY (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930205–56: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93010868. Source: OSTI; NTIS; INIS; GPO Dep.

Polyethylene encapsulation is being explored for potential use in treating nitrate salts and sludges at US Department of Energy (US DOE) underground storage tank facilities. Some of these wastes contain high concentrations of fission products and are expected to maintain equilibrium temperatures of 50–70°C for many years. The potential effects of elevated temperature and high radiation conditions on key waste form properties (e.g., mechanical integrity, leachability) are examined. After 6 months of thermal conditioning, waste form tests specimens show no degradation in mechanical integrity. Leaching at elevated temperature resulted in a small increase in leach rate (a factor of less than two), while diffusion remained the dominant mechanism of release. Full-scale polyethylene waste forms containing 50–70 wt % nitrate salt can be expected to leach a total of 5–17% of the original contaminant source term after 300 years of leaching under worst-case conditions (fully saturated at 70°C).

22921 (BNL–52361) **Seismic design and evaluation guidelines for the Department of Energy high-level waste storage tanks and appurtenances.** Bandyopadhyay, K.; Cornell, A.; Costantino, C.; Kennedy, R.; Miller, C.; Veletsos, A. Brookhaven National Lab., Upton, NY (United States). Jan 1993. 321p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93011793. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides guidelines for the design and evaluation of underground high-level waste storage tanks due to seismic loads. Attempts were made to reflect the knowledge acquired in the last two decades in the areas of defining the ground motion and calculating hydrodynamic loads and dynamic soil pressures for underground tank structures. The application of the analysis approach is illustrated with an example. The guidelines are developed for specific design of underground storage tanks, namely double-shell structures. However, the methodology discussed is applicable for other types of tank structures as well. The application of these and of suitably adjusted versions of these concepts to other structural types will be addressed in a future version of this document.

22922 (BNL–52365) **Polyethylene encapsulation of single-shell tank low-level wastes: Annual progress report.** Kalb, P.D.; Fuhrmann, M.; Cassidy, J.; Colombo, P.; Franz, E.M.; Fuhrmann, M.; Heiser, J. III; Kalb, P.D.; Klages, J.; Pietrzak, R. Brookhaven National Lab., Upton, NY (United States). Sep 1992. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93012805. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes work supported by the UST-ID, conducted at Brookhaven National Laboratory I (BNL), to develop and demonstrate a polyethylene waste encapsulation process for low-level radioactive (LLW) and hazardous mixed wastes (HMW) stored in underground tanks. During FY 1992, studies were completed on the effects of elevated temperature on waste form integrity, strength and leachability. No changes in waste form integrity or compressive yield strength were detected after storing polyethylene waste forms containing 50, 60 and 70 wt% sodium nitrate at 70°C for 3 months. Leaching of polyethylene waste forms with similar nitrate salt loadings at temperatures up to 70°C resulted in slight increases in leachability (< a factor of 2), compared with leaching at ambient temperatures. Leaching of sodium nitrate from polyethylene waste forms was diffusion-controlled, enabling extrapolation of laboratory leach data to full-scale waste forms over long time periods. Full-scale polyethylene waste forms containing 50 to 70 wt% nitrate salt could be expected to leach a total of 5% to 17% of the original contaminant source term after 300 years of leaching under worst-case (70°C, fully saturated) conditions. This is about 25 to 75 times lower leachability than conventional cement grout waste forms containing a maximum of 20 wt% nitrate salts.

22923 (CEA-CONF–11231) **Balance carried out on an alpha waste incinerator in order to qualify its filtration system.** Cartier, R. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Burghofer, P.; Tregoures, A.; Maurel, J.M.; Vendel, J. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. [17p.] (CONF-910559–: 10. annual international incineration conference: environmental concerns and controls, Knoxville, TN (United States), 13-17 May 1991). Order Number DE93626417. Source: OSTI; NTIS (US Sales Only); INIS.

A balance was carried out on a pilot incinerator of inactive solid waste running at 4 kg/h. Various measurements were taken in order to qualify the prefiltration system of the incineration process operating by pyrolysis, afterburning and calcination: determining the ventilation characteristics of the plant (gas flow rates and residence time) and the physico-chemical characteristics of the effluent (mass flow and granulometric range of particles, chemical composition of gases). Various methods of sampling and of analyzing the gases were adopted and a thermochemical model was produced. Its results are reasonably close to the experimental measurements. The emission consists of submicronic particles and porous layers are the best adapted cleaning system.

22924 (CONF-920791–, pp. 6, Paper 15) **Remote chemical characterization.** Mech, S.J.; Reich, F.R.; Winkelman, W.D. US-DOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

To support the safe and environmentally responsible operation and surveillance of the hazardous wastes at Hanford, new and innovative technology must be implemented. An important class of technology, referred to as remote sensing, will allow non-contacting sensing and characterization of materials in place. A technology of specific interest is non-contacting, optical spectroscopy. In general this method records the light reflectance and transmission properties of materials in the infrared region of the electromagnetic spectrum and analyzes this information to perform chemical and mineralogical identification and characterization. Such material has a unique spectroscopy fingerprint.

22925 (CONF-920791–, pp. 7, Paper 16) **Integrated instrument platform for in situ characterization of tank wastes.** DeLisle, G.V. (Westinghouse Hanford Co., Richland, WA (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Development of the Integrated Instrument Platform (IIP) for In-situ Characterization of Tank Wastes is one of many activities supporting the Underground Storage Tanks Integrated Demonstration (UST-ID). The overall summary work scope, planning, and funding guidance is provide in Technical Task Plan (TTP) RL421211. Success of this TTP is dependent on characterization and deployment technologies being developed as part of several separate TTPs and private industries. A key sub-task of this TTP is to identify those technologies that are applicable, transfer them, and integrate them into a complete and working system.

22926 (CONF-930205–17) **US Department of Energy, Office of Technology Development, mixed-waste treatment research, development, demonstration, testing, and evaluation.** Berry, J.B. (Oak Ridge National Lab., TN (United States)); Backus, P.M.; Conley, T.B.; Coyle, G.J.; Lurk, P.W.; Wolf, S.M. Oak Ridge National Lab., TN (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '93; Tucson, AZ (United States); 28 Feb - 4 mar 1993. Order Number DE93007862. Source: OSTI; NTIS; INIS; GPO Dep.

Department of Energy (DOE) mixed waste is contaminated with both chemically hazardous and radioactive species. The DOE is responsible for regulating radioactive species while the Environmental Protection Agency (EPA) is responsible for regulating hazardous species. Dual regulations establish treatment standards and therefore affect the treatment technologies used to process mixed waste. This duality is reflected in technology development initiatives. Significant technology development has been conducted for either radioactive or hazardous waste, but limited technology development, specifically addressing mixed waste treatment issues, has been completed. Technology has not been designed, developed, demonstrated, or tested to produce a low-risk final waste form that increases the probability that the final waste form will be disposed.

22927 (CONF-930205–53) **Planning for and managing environmental restoration waste.** Miller, J.Q. Oak Ridge National Lab., TN (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC05-76OR00001. From Waste management '93; Tucson, AZ (United States); 28 Feb - 4 mar 1993. Order Number DE93009726. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the approach used to support the management of environmental restoration (ER) waste. A general description is provided of the tools and techniques that have been developed and applied to produce waste generation forecast data and treatment, storage, and disposal capacity needs. The ER Program can now consistently manage ER waste streams from initial generation through ultimate disposal. Utilizing the valuable information that results from application of strategically planned systems and techniques demonstrates the ability to provide the necessary waste management support for the ER cleanup process.

22928 (CONF-930364–1) **Development of treatment technologies for the processing of US Department of Energy mixed waste.** Backus, P.M. (Oak Ridge National Lab., TN (United States)); Berry, J.B.; Coyle, G.J.; Lurk, P.W.; Wolf, S.M. Oak Ridge National Lab., TN (United States). [1993]. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Spring national meeting of the American Institute of Chemical Engineers; Houston, TX (United States); 28 Mar - 1 apr 1993. Order Number DE93010831. Source: OSTI; NTIS; INIS; GPO Dep.

Waste contaminated with chemically hazardous and radioactive species is defined as mixed waste. Significant technology development has been conducted for separate treatment of hazardous and radioactive waste, but technology development addressing mixed-waste treatment has been limited. Management of mixed waste

requires treatment which must meet the standards established by the US Environmental Protection Agency for the specific hazardous constituents while also providing adequate control of the radionuclides. Technology has not been developed, demonstrated, or tested to produce a low-risk final waste form specifically for mixed waste. Throughout the US Department of Energy (DOE) complex, mixed waste is a problem because definitive treatment standards have not been established and few disposal facilities are available. Treatment capability and capacity are also limited. Site-specific solutions to the management of mixed waste have been initiated; however, site-specific programs result in duplication of technology development between various sites. Significant progress is being made in developing technology for mixed waste under the Mixed Waste Integrated Program. The status of the technical initiatives in chemical/physical treatment, destruction/stabilization technology, off-gas treatment, and final waste form production/assessment is described in this paper.

22929 (CONF-930396–10) **Potential impact of DOE's performance objective for protection of inadvertent intruders on low-level waste disposals at Oak Ridge National Laboratory.** Kocher, D.C. Oak Ridge National Lab., TN (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '93; Tucson, AZ (United States); 1-5 Mar 1993. Order Number DE93010823. Source: OSTI; NTIS; INIS; GPO Dep.

Performance objectives for disposal of low-level radioactive waste at Department of Energy (DOE) sites include limits on radiation dose to inadvertent intruders. This paper investigates the potential impact of DOE's performance objective for protection of inadvertent intruders on the acceptability of low-level waste disposals at Oak Ridge National Laboratory (ORNL). The analysis is based on waste volumes and radionuclide inventories for recent disposals and estimated doses to an inadvertent intruder for assumed exposure scenarios. The analysis indicates that more than 99% of the total volume of waste in recent disposals meets the performance objective for inadvertent intruders, and the volume of waste found to be unacceptable for disposal is only about 16 m^3. Therefore, DOE's performance objective for protection of inadvertent intruders probably will not have unreasonably adverse impacts on acceptable waste disposals at ORNL.

22930 (CONF-930408–69) **Using QA classification to guide design and manage risk.** Lathrop, J. (Strategic Insights, Los Altos, CA (United States)); DeKlever, R.; Petrie, E.H. Raytheon Services Nevada, Las Vegas, NV (United States). 28 Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-91NV10833. From International high-level radioactive waste management conference; Las Vegas, NV (United States); 25-29 Apr 1993. Order Number DE93012990. Source: OSTI; NTIS; INIS; GPO Dep.

Raytheon Services Nevada has developed a classification process based on probabilistic risk assessment, using accident/impact scenarios for each system classified. Initial classification analyses were performed for the 20 systems of Package IA of the Exploratory Studies Facility (ESF). The analyses demonstrated a solid, defensible methodological basis for classification which minimizes the use of direct engineering judgment. They provide guidance for ESF design and risk management through the identification of: The critical characteristics of each system that need to be controlled; and the parts of the information base that most need to be further developed through performance assessment or other efforts.

22931 (CORR–83-0124-Del.Ver.) **Savannah River Plant Nuclear Material Production and Defense Waste Management Facilities upgrading study, Savannah River Plant: First annual reappraisal.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. Jan 1980. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035 ;AC09-76SR00001. Order Number DE93009747. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document reports the results of an appraisal of the condition of equipment in the facilities operated by Du Pont at the Savannah River Plant for the Department of Energy.

22932 (DOE/DP/00789–T268) **Test plan: WIPP Materials Interface Interactions Test (MIIT).** Molecke, M.A. (Sandia National Labs., Albuquerque, NM (United States)); Wicks, G.G. Sandia National Labs., Albuquerque, NM (United States); Savannah River Lab., Aiken, SC (United States). Jul 1986. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012199. Source: OSTI; NTIS; INIS; GPO Dep.

The WIPP Materials Interface Interactions Test (MIIT) multinational, cooperative, in situ experiments to be replaced in the Waste Isolation Pilot Plant (WIPP) starting in 1986. The MIIT involves the in situ evaluation of various waste package materials interactions in a repository-relevant, brine environment. The predominant emphasis in these tests is (1) to assess the performance.of defense high-level waste glass representative of that to be produced at the Defense Waste Processing Facility (DWPF), and (2) to obtain a fuller understanding of the relative behavior of this glass by comparing it to the behavior of many other high-level and transuranic glass waste forms in an Identical salt repository environment. For the purpose of ed to denote waste glass behavior this Test Plan, the term "performance" is used in the specific environment considered or tested. The tested glass waste forms come from various US and foreign laboratories. This assessment involves the long-term, in situ leaching and surface interactions testing in brine, in boreholes in the WIPP, at 90°C. It is anticipated that segments of the WIPP MIIT will continue for as long as 5 years. All glass waste forms used in this test series are nonradioactive.

22933 (DOE/DP/00789–T273) **Test plan: WIPP simulated CH and RH TRU waste tests: Technology experiments (TRU TE) (Container durability, backfill interactions, and nuclide migration).** Molecke, M.A. Sandia National Labs., Albuquerque, NM (United States). Apr 1986. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012204. Source: OSTI; NTIS; GPO Dep.

The WIPP Simulated CH and RH TRU Waste Tests are a collection of related technology experiments and operational demonstrations. These technology experiments (TE) evaluate the in situ durability or containment integrity (i.e., the corrosion behavior and crush resistance) of contact-handled transuranic waste (CH TRU) drums and remote-handled transuranic waste (RH TRU) canisters. Also to be evaluated are the interactions of the waste containers and several backfill materials, and the migration behavior 'of nonradioactive, chemical tracers representative of radionuclides eventually released from the waste containers in the long term. The behavior of TRU waste forms will not be evaluated in these tests. The degradation behavior of TRU waste matrices was characterized previously in the laboratory, and is reviewed in Section 9.1. All CH TRU drums and RH TRU canisters used in these tests are simulated only in the sense that they contain no radioactive materials.

22934 (DOE/DP/00789–T274) **Test plan: Air intake shaft performance test – Addendum for obtaining cores in the Culebra for radionuclide retardation studies.** Gelbard, F. Sandia National Labs., Albuquerque, NM (United States). Oct 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012205. Source: OSTI; NTIS; INIS; GPO Dep.

Core samples are needed for obtaining data on radionuclide retardation. The cores will be used to first determine local basic properties of Culebra rock such as permeability, structural integrity, fracture spacing, and fracture size. These quantities will then be used to design a laboratory experimental program to determine radionuclide retardation in a column flow apparatus using the cores obtained in this project. This addendum covers only the coring activities necessary to retrieve Culebra cores. The laboratory work will be documented in a separate test plan. It is anticipated that Culebra rock samples will be highly fractured, with a fracture spacing on the order of 2 to 3 inches To obtain representative core samples that are intact, horizontal cores about 6 inches in diameter and several feet long will be needed. These cores will provide a good indication of Culebra rock fracturing and provide several samples needed to conduct column flow experiments. If the rock is so fractured that only rubble is obtained, then the rubble will be used

in the column experiments. In addition, as a byproduct of the coring operation, natural groundwater collected from the holes will be used to develop a synthetic brine for the laboratory experiments.

22935 (DOE/DP/00789–T275) **Test plan appendix: WIPP simulated RH TRU waste add-on tests (Additional rock mechanics and waste package performance).** Molecke, M.A.; Munson, D.E. Sandia National Labs., Albuquerque, NM (United States). Aug 1987. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012206. Source: OSTI; NTIS; GPO Dep.

Simulated RH TRU waste technology experiments have been subjected to heated-environment operations in WIPP Room T since September 1986, as part of program. The scope of the expanded at this time to address a (radioactive) PH TRU waste storage in the WIPP in "reference" storage roam configurations, or modifications thereto. specifically, more data are needed on the rock mechanics behavior of the RH TRU storage roams and adjacent pillars, closure deformation for both unlined boreholes and sleeved boreholes, and related waste package performance considerations. The data will be applicable to both the initial five-year period of retrievability (using sleeved boreholes) and the post-retrieval period (with unlined boreholes). In situ testing data will also be compared to 3-dimensional computer modeling of rock mechanics behavior. Such data and associated modeling studies obtained and interpreted as early as possible will allow the WIPP project (including operations, scientific support, and performance assessment) to assess the consequences of maximum thermal loading during the pilot phase of operations. Data and testing experience will support the design, emplacement, and retrieval operations, and related concerns associated with these operations. RH TRU data gathered in the nonradioactive test environment of Room T will be useful and timely to the WIPP project and will minimize testing expenses and difficulties.

22936 (DOE/DP/00789–T276) **Test plan: WIPP horizon in situ permeability measurements.** Peterson, E.W. (S-Cubed, La Jolla, CA (United States)); Stormont, J.C. Sandia National Labs., Albuquerque, NM (United States); S-Cubed, La Jolla, CA (United States). Aug 1984. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012207. Source: OSTI; NTIS; GPO Dep.

In situ gas permeability tests are to be conducted at the proposed repository horizon at the Waste Isolation Pilot Plant (WIPP) site in southeastern New Mexico. These tests, as well as others, are part of the Plugging and Sealing Program. The tests described in this test plan represent the initial effort to obtain a detailed in situ measure of the flow characteristics of the formation adjacent to the underground workings at the proposed repository site. Measurements will be made in boreholes drilled in the vertically up, vertically down, and horizontal directions. Tests will be performed at various hole depths to obtain data in both the disturbed and free-field regions. These permeability tests will provide data on the repository near-field permeability properties and will aid in identifying future test requirements. In addition, these data may be used as input to various performance assessment analyses and preliminary plug designs.

22937 (DOE/DP/00789–T278) **1986 WIPP horizon permeability measurements.** Stormont, J. Sandia National Labs., Albuquerque, NM (United States). 16 Dec 1985. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012209. Source: OSTI; NTIS; GPO Dep.

Addendum to "Test plan: WIPP horizon in situ permeability measurements," E. Peterson and J. Stormont, August 1984.

A series of permeability measurements in the WIPP facility have been planned for fiscal year 1986. These measurements are to be made by S-Cubed and SNL and follow from and supplement previous measurements. These measurements are part of the overall WIPP horizon permeability testing and are justified and described in general terms in the previously published test plan; this paper discusses the technical motivation and test design concepts of these particular measurements.

22938 (DOE/DP/00789–T280) **Test series C of the small scale seal performance tests.** Stormont, J.C. Sandia National Labs., Albuquerque, NM (United States). 30 Sep 1986. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012211. Source: OSTI; NTIS; GPO Dep.

Test Series C will evaluate the performance of salt and salt/bentonite block-type seal components. These seal components are essentially a "backfill," but emplaced at a higher density and with more control over the material composition and its installation. These type of seal components are presently being considered as part of the multiple-component drift seals and perhaps as a portion of the shaft seals. The objectives of Test Series C are: 1. To develop and evaluate a technique for the manufacture and installation of block-type seal components; 2. To obtain data on the fluid flow performance of salt and salt/bentonite block-type seal systems; 3. To obtain data on the structural performance of salt and salt/bentonite block-type seal systems; and 4. To provide data for the development and validation of predictive numerical codes and models.

22939 (DOE/DP/00789–T281) **Field operations plan for permeability testing in the WIPP-site underground facility.** Saulnier, G.J. Jr. (Intera Technologies, Inc., Austin, TX (United States)). Sandia National Labs., Albuquerque, NM (United States); Intera Technologies, Inc., Austin, TX (United States). 9 Aug 1988. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012212. Source: OSTI; NTIS; GPO Dep.

This Field Operations Plan (FOP) describes the objectives, design, equipment, and methodology for permeability tests to be conducted in boreholes drilled from the underground facility currently under construction at the 655-meter depth level at the Waste Isolation Pilot Plant (WIPP) site in southeastern New Mexico into relatively undisturbed portions of the Salado formation. The WIPP is a U. S. Department of Energy research and development facility designed to demonstrate safe disposal of transuranic radioactive wastes resulting from the United States's defense programs. The testing described in this FOP will be conducted by INTERA Technologies, Inc., under contract to the Earth Sciences Division of Sandia National Laboratories (SNL). The testing program is part of the WIPP-site Hydrogeologic Characterization and Plugging and Sealing programs being conducted by SNL's Earth Sciences and Experimental Programs Divisions, respectively.

22940 (DOE/DP/00789–T285) **Test plan: Intermediate scale borehole test–WIPP in situ testing.** Munson, D.E. Sandia National Labs., Albuquerque, NM (United States). Aug 1989. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012216. Source: OSTI; NTIS; INIS; GPO Dep.

This Intermediate Scale Borehole Test is in response to a request by the WIPP Panel of the National Academy of Sciences to investigate influence of scale (i.e., the size of an underground opening) effects on the creep closure of a natural salt deposit, in situ. The purpose of this intermediate scale test is to evaluate the possible influence of test scale on the creep response of salt. The results are to be usedas partial input to the resolution of the discrepancy between calculated and measured in situ closures. The test consists of an instrumented, large diameter, horizontal borehole emplaced in the existing pillar between Rooms C2 and C1. The depth of the core hole will be at least 9.2 m (30 ft). Because most of the instruments will be emplaced prior to drilling of the intermediate scale borehole, the instruments will monitor the changes in ground displacements and stresses as the borehole is drilled.

22941 (DOE/DP/00789–T287) **Test plan: Gas-threshold-pressure testing of the Salado Formation in the WIPP underground facility.** Saulnier, G.J. Jr. (INTERA, Inc., Austin, TX (United States)). Sandia National Labs., Albuquerque, NM (United States); INTERA, Inc., Austin, TX (United States). Mar 1992. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012218. Source: OSTI; NTIS; INIS; GPO Dep.

Performance assessment for the disposal of radioactive waste from the United States defense program in the WIPP underground

facility must assess the role of post-closure was generation by waste degradation and the subsequent pressurization of the facility. be assimilated by the host formation will Whether or not the generated gas can be assimilated by the host formation will determine the ability of the gas to reach or exceed lithostatic pressure within the repository. The purpose of this test plan is (1) to present a test design to obtain realistic estimates of gas-threshold pressure for the Salado Formation WIPP underground facility including parts of the formation disturbed by the underground of the Salado, and (2) to provide a excavations and in the far-field or undisturbed part framework for changes and amendments to test objectives, practices, and procedures. Because in situ determinations of gas-threshold pressure in low-permeability media are not standard practice, the methods recommended in this testplan are adapted from permeability-testing and hydrofracture procedures. Therefore, as the gas-threshold-pressure testing program progresses, personnel assigned to the program and outside observers and reviewers will be asked for comments regarding the testing procedures. New and/or improved test procedures will be documented as amendments to this test plan, and subject to similar review procedures.

22942 (DOE/FTR–93012360) **[Travel to Russia to convene a technology exchange workshop at the Khlopin Radium Institute in St. Petersburg in the area of chemical separations or partitioning of elements from radioactive waste streams and to hold the second meeting of the US/Russian Joint Coordinating Committee on Environmental Restoration and Waste Management (JCCEM) with MINATOM senior staff in Moscow]: Foreign trip report, October 29–November 7, 1992.** Bradley, D.J. (Pacific Northwest Lab., Richland, WA (United States)); Frank, C.W.; Fryberger, T.A.; De LaTorre, G.; Solecki, J.E. USDOE, Washington, DC (United States). 6 Dec 1992. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012360. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A US Department of Energy (DOE) delegation, led by Dr. Clyde Frank, visited Russia from November 1–6, 1992 to conduct a technology exchange workshop at the Khlopin Radium Institute in St. Petersburg in the area of chemical separations or partitioning. This technology is of interest due to the possibility of reducing the amount of radioactive materials, via chemical separation and concentration, that may have to be disposed of. An initial joint US DOE/Khlopin Radium Institute study, completed in September 1992, was reviewed and the final report from this work is attached as Appendix A. Presentations on separations chemistry activities were presented by both US and Russian scientists. A basis for a continuing scope of work for application of Russian separations technology for processing US radioactive wastes was prepared for review. Waste streams in addition to those at Hanford will also be considered.

22943 (DOE/FTR–93012926) **[Travel to the United Kingdom for information exchange on plutonium waste, manufacturing processes, Complex 21 and Rocky Flats programs]: Foreign trip report, March 23–25, 1992.** Rising, T.L. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 16 Jun 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE93012926. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to exchange information on plutonium waste, D&D and manufacturing processes and issues for the advancement of Complex 21 and Rocky Flats programs. Additionally, Dr. Rising took a trip up to AEA's (Atomic Energy Authority) Dounreay facility to discuss the practicality of using mediated Electrochemical Oxidation (MEMO) for destruction of organic wastes. While at Dounreay, Dr. Rising toured their operating supercompator facility.

22944 (DOE/FTR–93013558) **[Travel to Mol, Belgium and Karlsruhe, Germany to discuss decommissioning technology and noble metals testing]: Foreign trip report, June 29–July 17, 1992.** Calmus, R.B. (comp.). Westinghouse Hanford Co., Richland, WA (United States). 1992. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93013558. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Based on discussions between Belgoprocess, the company responsible for conducting the Belgian Radioactive Waste Management Program and Hanford staff, Dr. E. C. Norman of the US Department of Energy, Richland Field Office (RL), and Mr. R. B. Calmus, Westinghouse Hanford Company (WHC), during the subject trip to Mol, Belgium, there is a distinct potential for establishing a decommissioning technology information exchange agreement between US Department of Energy and the Belgian State. It appears that if the PAMELA decommissioning activities are relevant to Hanford activities [specifically Hanford Waste Vitrification Plant (HWVP) melter decommissioning] and, if decommissioning activities at Hanford are of interest to the Belgians, a bilateral technology exchange agreement could be established. Kernforschunqszentrum GmbH ESM Testing. The HWVP noble metals testing being conducted at Kernforschungszentrum GmbH [Karlsruhe Nuclear Research Center, (KfK)] in Karlsruhe, Germany, includes feed preparation and vitrification of five batches of HWVP FY 1991 reference simulant feed (four with noble metals and one without). The first batch scheduled for processing is void of noble metals (NM) and is being tested to provide equipment verification and melter operating parameters information. The remaining batches (4) contain the reference noble metals composition. The noble metals testing is expected to provide important information on noble metals effects on melter, and ancillary equipment, performance and provide input data to the HWVP melter performance assessment activity.

22945 (DOE-HMIP-RR–92.099) **Comparative study of humic and fulvic substances in groundwaters. Pt. 3: Metal complexation with humic substances.** Higgo, J.J.W. (British Geological Survey, Keyworth (United Kingdom). Fluid Processes Research Group); Davis, J.; Smith, B. Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution. 1992. [75p.] Contract PECD-7/9/533;WE/92/12. Order Number DE93626424. Source: OSTI; NTIS (US Sales Only); INIS.

Humic and fulvic acids were extracted from large volumes of three different groundwaters. After purification they were characterised in terms of proton-binding properties, molecular weight, UV spectra and trace impurities. Conditional stability constants were measured for fulvic and humic binding with cobalt, nickel, calcium and uranium. From these, intrinsic binding constants were calculated using Humic Ion-Binding Model V which was found to describe the dependence of binding strength on pH and ionic strength reasonably well. Species distributions in the groundwaters were calculated and the effects of competition with alkali earths are discussed. All the experimental data are reported in a separate volume (Appendix A and B) so that they are available for testing other models. (author).

22946 (DOE-HMIP-RR–92.118) **Procedures for the elicitation of expert judgements in the probabilistic risk analysis of radioactive waste repositories: an overview.** Watson, S.R. Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution. 1992. [36p.] Contract PECD-7/9/637. Order Number DE93626425. Source: OSTI; NTIS (US Sales Only); INIS.

In modelling the consequences of a radioactive waste repository using Probabilistic Risk Analysis, it is necessary to use the judgement of experts both in assessing probabilities subjectively, and in choosing suitable analytic frameworks. This report presents the literature on these topics, first discussing the meaning of probability in PRA, and then giving an extensive review of what is known about how to elicit probabilities from experts. The report then provides an overview of the less well developed field of how best to use expertise in the construction of models for PRA. (author).

22947 (DOE/ID–10415) **Waste handling plan for the INEL Oversight Program (As required under the Waste Handling Memorandum of Agreement).** EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (INEL/MISC–93014). Order Number DE93012171. Source: OSTI; NTIS; INIS; GPO Dep.

The State of Idaho will generate various quantities and types of waste during monitoring activities associated with the Idaho National Engineering Laboratory (INEL) Oversight Program. This waste, referred to as INEL Oversight Program (IOP) waste, is the

waste resulting from field season activities of the IOP. Wastes generated at the INEL are broadly categorized by the types of contaminants they contain. These include: hazardous waste; high-level waste; low-level waste; mixed waste; sanitary waste; and transuranic waste. To the extent possible, generation of allowable MOA (Waste Handling Memorandum of Agreement) wastes should be minimized. Minimization of waste includes waste prevention, reduction of waste components, and recycling. The following are some general waste minimization techniques which pertain to current monitoring activities such as purging and sampling existing monitoring wells and associated activities. Regulations affecting the management of IOP can differ depending upon the site designation of the waste generation point. Possible site designations at the INEL include: non-regulated sites; comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) sites; sites regulated under the authority of RCRA; and newly discovered contaminated sites. (AT)

22948 (DOE/LLW–162) **Management plan for revision for DOE Order 5820.2A: National Low-Level Waste Management Program.** Kudera, D.E.; McMurtrey, C.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (INEL/MISC–92154). Order Number DE93012170. Source: OSTI; NTIS; GPO Dep.

This document discusses how the US Department of Energy (DOE) will manage the revision of DOE Order 5820.2A, "Radioactive Waste Management," and describes personnel involved in the effort, estimated cost and schedule, and administrative and reporting requirements. The organizational structure and responsibilities and approval authorities for the revision are discussed. A planning package is included that provides details on the schedule, budget, and justification and assumptions used in developing the plan for revision.

22949 (DOE/LLW–166) **Sealed source and device removal and consolidation feasibility study: National Low-Level Waste Management Program.** Ward, J.E. (Pacific Northwest Lab., Richland, WA (United States)); Carter, J.G.; Meyers, R.L. EG and G Idaho, Inc., Idaho Falls, ID (United States); Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013696. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is to assess the feasibility of removing Greater-Than-Class C (GTCC) sealed sources from their containment device and consolidating them for transport to a storage or disposal facility. A sealed source is a sealed capsule containing a radioactive material that is placed in a device providing radioactive containment. It is used in the medical, industrial, research, and food-processing communities for calibrating, measuring, gauging, controlling processes, and testing. This feasibility study addresses the key operational, safety, regulatory, and financial requirements of the removal/consolidation process. This report discusses the process to receive, handle, repackage, and ship these sources to an interim or dedicated storage facility until a final disposal repository can be built and become operational (~ c. 2010). The study identifies operational and facility requirements to perform this work. Hanford, other DOE facilities, and private hot-cell facilities were evaluated to determine which facilities could perform this work. The personnel needed, design and engineering, facility preparation, process waste disposal requirements, and regulatory compliance were evaluated to determine the cost to perform this work. Cost requirements for items that will have to meet future changing regulatory requirements for transportation, transportation container design and engineering, and disposal were not included in this study. The cost associated with in-process consolidation of the sealed sources reported in this study may have not been modified for inflation and were based on 1992 dollars. This study shows that sealed source consolidation is possible with minimal personnel exposure, and would reduce the risk of radioactive releases to the environment. An initial pilot-scale operation could evaluate the possible methods to reduce the cost and consolidate sources.

22950 (DOE/LLW–172) **Greater-than-Class C Low-Level Radioactive Waste Program 1992 baseline strategy.** EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013738. Source: OSTI; NTIS; INIS; GPO Dep.

This baseline strategy document describes Department of Energy (DOE) goals, objectives, and strategy for fulfilling its responsibility to dispose of greater-than-Class C low-level radioactive waste (GTCC LLW) according to the requirements of Section 3(b) of the Low-Level Radioactive Waste Policy Amendments Act of 1985, Public Law 99-240. This document describes the baseline strategy being employed at the end of FY 1992. The strategy for fulfilling the above responsibility consists of three tasks: interim storage of limited quantities of GTCC LLW at a currently operating DOE facility to eliminate a potential public health and safety threat; acceptance of GTCC LLW for storage in a DOE dedicated facility on an as-needed basis pending disposal; and disposal in a facility licensed by the Nuclear Regulatory Commission. The objectives, assumptions, and strategies for each of these tasks are presented in this plan.

22951 (DOE/NV/10872–8) **Identification and characterization of conservative organic tracers for use as hydrologic tracers for the Yucca Mountain Site Characterization Project: Quality Assurance Project Plan: Quarterly technical progress report, January 1, 1993–March 31, 1993.** Stetzenbach, K.J. Nevada Univ., Las Vegas, NV (United States). Harry Reid Center for Environmental Studies. 25 Feb 1993. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE93014228. Source: OSTI; NTIS; INIS; GPO Dep.

Studies continued on organic tracers for use as hydrologic tracers as part of the Yucca Mountain Site Characterization project. This subject report for the quarter 01/01/93 through 03/31/93 discusses the following issues: project organization and responsibilities; quality assurance program; design control; procurement document control; instructions, procedures, and drawings; document control; control of purchased items and services; identification and control of items; control of processes; inspection; test control; control of measuring and test equipment; handling, storage, and shipping; inspection, test, and operating status; control of nonconforming items and conditions; corrective action; quality assurance records; audits; software quality assurance; and scientific investigation.

22952 (DOE/NV/10872–T55) **Quarterly progress report on the Waste Package Project at the University of Nevada, Las Vegas, January 1, 1993–March 31, 1993.** Ladkany, S.G. Nevada Univ., Las Vegas, NV (United States). 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE93014241. Source: OSTI; NTIS; GPO Dep.

Accomplishments for the past quarter are briefly described for: task A.2.1 on criticality studies and drift emplacement model; and for task A.2.2. on waste container alternate design considerations.

22953 (DOE/OR–01-1100-D3) **RCRA Closure Plan for the Bear Creek Burial Grounds B Area and Walk-In Pits at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Energy Systems Environmental Restoration Program; Y-12 Environmental Restoration Program.** Oak Ridge Y-12 Plant, TN (United States). Apr 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (Y/ER–53-D3). Order Number DE93013251. Source: OSTI; NTIS; INIS; GPO Dep.

In June 1987, the RCRA Closure/Postclosure Plan for the Bear Creek Burial Grounds (BCBG) was submitted to the Tennessee Department of Environment and Conservation (TDEC) for review and approval. TDEC modified and issued the plan approved on September 30, 1987. Y/TS-395 was initially intended to apply to A Area, C-West, B Area, and the Walk-In Pits of BCBG. However, a concept was developed to include the B Area (non-RCRA regulated) in the Walk-In Pits so that both areas would be closed under one cap. This approach included a tremendous amount of site preparation with an underlying stabilization base of 16 ft of sand for blast protection. In January 1993, the Closure Plan was revised to include inspection and maintenance criteria and to reflect that future monitoring and remediation would be conducted as part of

the ongoing Comprehensive Environmental Response, Compensation, and Liability Act activities at the Oak Ridge Y-12 Plant. This Closure Plan revision is intended to reflect the placement of the Kerr Hollow Quarry debris at the Walk-In Pits, revise the closure dates, and acknowledge that the disposition of a monitoring well within the closure site cannot be verified.

22954 (DOE-RAS–92.003) **Induced polarisation and the assessment of sorption/diffusion at radioactive waste repository sites: Final report.** Bouda, S. (Exeter Univ. (United Kingdom). Earth Resources Centre); Durrance, E.M.; Grainger, P. Department of the Environment, London (United Kingdom). Radioactive Substances Div. 1992. [75p.] Contract PECD-7/9/442. (ERC–91-22.). Order Number DE93626426. Source: OSTI; NTIS (US Sales Only); INIS.

Induced polarisation is a geophysical technique used in mineral exploration in search of metallic ore deposits. Clay minerals also polarise when subjected to an electric current, although the mechanism differs from that of metallic bodies, and involves, amongst other properties, the clay mineral species, the interlayer spacing of the clay, and the nature and abundance of mobile ions in the pore fluid. As a result, it was proposed that induced polarisation of clays could be used as a method for determining their permeability and diffusivity. The work carried out in developing experimental procedures, and evaluating the feasibility of the proposal is presented in this report. (author).

22955 (DOE/RL–91-39-Rev.1A) **Waste water pilot plant research, development, and demonstration permit application: Revision 1A.** USDOE Richland Field Office, WA (United States). Mar 1993. 295p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93012618. Source: OSTI; NTIS; INIS; GPO Dep.

This permit application has been prepared to obtain a research, development, and demonstration permit to perform pilot-scale treatability testing on the 242-A Evaporator process condensate waste water effluent stream. It provides the management framework, and controls all the testing conducted in the waste water pilot plant using dangerous waste. It also provides a waste acceptance envelope (upper limits for selected constituents) and details the safety and environmental protection requirements for waste water pilot plant testing. This permit application describes the overall approach to testing and the various components or requirements that are common to all tests. This permit application has been prepared at a sufficient level of detail to establish permit conditions for all waste water pilot plant tests to be conducted.

22956 (DOE/RL–92-51) **100 Area soil washing treatability test plan.** USDOE Richland Field Office, WA (United States). Mar 1993. 58p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012617. Source: OSTI; NTIS; INIS; GPO Dep.

This test plan describes specifications, responsibilities, and general methodology for conducting a soil washing treatability study as applied to source unit contamination in the 100 Area. The objective ofthis treatability study is to evaluate the use of physical separation systems and chemical extraction methods as a means of separating chemically and radioactively contaminated soil fractions from uncontaminated soil fractions. The purpose of separating these fractions is to minimize the volume of soil requiring permanent disposal. It is anticipated that this treatability study will be performed in two phases of testing, a remedy screening phase and a remedy selection phase. The remedy screening phase consists of laboratory- and bench-scale studies performed by Battelle Pacific Northwest laboratories (PNL) under a work order issued by Westinghouse Hanford Company (Westinghouse Hanford). This phase will be used to provide qualitative evaluation of the potential effectiveness of the soil washing technology. The remedy selection phase, consists of pilot-scale testing performed under a separate service contract to be competitively bid under Westinghouse Hanford direction. The remedy selection phase will provide data to support evaluation of the soil washing technology in future feasibility studies for Interim Remedial Measures (IRMs) or final operable unit (OU) remedies. Performance data from these tests will indicate whether applicable or relevant and appropriate requirements (ARARs) or cleanup goals can be met at the site(s) by application of soil washing. The remedy selection tests wig also allow estimation of costs associated with implementation to the accuracy required for the Feasibility Study.

22957 (DOE/RW–0345P) **DOE's Yucca Mountain studies.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). Education and Information Div.; USDOE Yucca Mountain Site Characterization Project Office, Las Vegas, NV (United States). Dec 1992. 21p Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS.

This booklet is about the disposal of high-level nuclear waste in the United States. It is for readers who have a general rather than a technical background. It discusses why scientists and engineers thinkhigh-level nuclear waste may be disposed of safely underground. It also describes why Yucca Mountain, Nevada, is being studied as a potential repository site and provides basic information about those studies

22958 (DOE/RW–0410) **Program Baseline Change Control Board charter.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). Feb 1993. 7p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012192. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Charter is to establish the Program Baseline Change Control Board (PBCCB) for the Office of Civilian Radioactive Waste Management (OCRWM) Program, and to describe its organization, responsibilities, and basic methods of operation. Guidance for implementing this Charter is provided by the OCRWM Baseline Management Plan (BMP) and OCRWM Program Baseline Change Control Procedure.

22959 (DOE/RW–0411) **Technical career opportunities in high-level radioactive waste management.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). 1993. 15p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS.

Technical career opportunities in high-level radioactive waste management are briefly described in the areas of: Hydrology; geology; biological sciences; mathematics; engineering; heavy equipment operation; and skilled labor and crafts.

22960 (DOE/RW–0416) **OCRWM baseline management procedure for document identifiers.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). Mar 1993. 22p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013733. Source: OSTI; NTIS; INIS; GPO Dep.

This procedure establishes a uniform numbering system (document identifier) for all Program and project technical, cost, and schedule baselines, and selected management and procurement documents developed for and controlled by the Office of Civilian Radioactive Waste Management (OCRWM) for the Civilian Radioactive Waste Management System (CRWMS). The document identifier defined in this procedure is structured to ensure that the relational integrity between configuration items (CIs) and their associated documentation and software is maintained, traceable, categorical, and retrievable for the life of the program.

22961 (DOE/WIPP–89-011-Rev.1) **Test phase plan for the Waste Isolation Pilot Plant: Revision 1.** USDOE Albuquerque Field Office, NM (United States). Waste Isolation Pilot Plant Project Integration Office; Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 235p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012198. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) has prepared this Test Phase Plan for the Waste Isolation Pilot Plant to satisfy the requirements of Public Law 102-579, the Waste Isolation Pilot Plant (WIPP) Land Withdrawal Act (LWA). The Act provides seven months after its enactment for the DOE to submit this Plan to the Environmental Protection Agency (EPA) for review. A potential geologic repository for transuranic wastes, including transuranic mixed wastes, generated in national-defense activities, the WIPP is being constructed in southeastern New Mexico. Because these wastes remain radioactive and chemically hazardous for a very long time, the WIPP must provide safe disposal for thousands of years. The

DOE is developing the facility in phases. Surface facilities for receiving waste have been built and considerable underground excavations (2150 feet below the surface) that are appropriate for in-situ testing, have been completed. Additional excavations will be completed when they are required for waste disposal. The next step is to conduct a test phase. The purpose of the test phase is to develop pertinent information and assess whether the disposal of transuranic waste and transuranic mixed waste in the planned WIPP repository can be conducted in compliance with the environmental standards for disposal and with the Solid Waste Disposal Act (SWDA) (as amended by RCRA, 42 USC. 6901 et. seq.). The test phase includes laboratory experiments and underground tests using contact-handled transuranic waste. Waste-related tests at WIPP will be limited to contact-handled transuranic and simulated wastes since the LWA prohibits the transport to or emplacement of remote-handled transuranic waste at WIPP during the test phase.

22962 (DOE/WIPP–89-022-Rev.1) **Waste retrieval plan for the Waste Isolation Pilot Plant: Revision 1.** USDOE Albuquerque Operations Office, Carlsbad, NM (United States). Waste Isolation Pilot Plant Project Office; Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012197. Source: OSTI; NTIS; INIS; GPO Dep.

The US DOE has prepared this plan to meet the requirements of Public Law 102579, the Waste Isolation Pilot Plant (WIPP) LWA, The purpose. is to demonstrate readiness to retrieve from the WIPP underground transuranic radioactive waste that will be used for testing should retrieval be needed. The WIPP, a potential geologic repository for transuranic wastes generated in national-defense activities, has been constructed in southeastern New Mexico. Because the transuranic wastes will remain radioactive for a very long time, the WIPP must reasonably ensure safe performance over thousands of years. The DOE therefore decided to develop the facility in phases, to preclude premature decisions and to conduct the performance assessments needed to demonstrate long-term safety. Surface facilities for receiving waste have been built, and considerable underground excavation, 2150 feet below the surface, has been completed. The next step is a test phase, including underground experiments called "bin tests" and "alcove test(s)" with contact-handled transuranic waste. The objective of these waste tests is to collect relevant data about the gas-generation potential and volatile organic compound (VOC) source term of the waste for developing a basis for demonstrating long term safety by compliance with the applicable disposal regulations (40 CFR 191, 264 and 268). The test phase will end when a decision is made to begin disposal in the WIPP or to terminate the project if regulatory compliance cannot be determined and demonstrated. Authorization to receive transuranic waste at the WIPP for the test phase is given by the WIPP LWA provided certain requirements are met.

22963 (DPSTSA–200-10-Suppl.-18-Del.Ver.) **Safety analysis, 200 Area, Savannah River Plant separations area operations: Liquid radioactive waste handling facilities: Supplement 18.** Legler, B.M.; McDonell, W.R.; Perkins, W.C.; Stephenson, A.T. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab. Aug 1988. 582p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001 ;AC09-89SR18035. Order Number DE93009745. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report documents operations at the Savannah River Plant's 200 Area. Topics discussed include liquid radioactive waste handling, storage tanks, and meteorology at the Savannah River Plant. A glossary and tank inventories are included also.

22964 (DPW–3637) **Notes on meeting of Waste Processing Committee.** Winsche, W.E. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 29 Oct 1951. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–465). Order Number DE93011160. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this memorandum is to summarize an October, 1951 meeting of the duPont Waste Processing Committee for internal use prior to issue of formal minutes.

22965 (DPW–4300) **Solid waste disposal.** Purdie, O.D. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Atomic Energy Div. 10 Jan 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–459). Order Number DE93011154. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this January 1952 memo, from Otis Purdie, outlines possible alternatives for handling solid combustible wastes at the Savannah River site. Three alternatives were considered. These were incineration, baling, and storage without processing. After a cost analysis, it was decided that incineration was undesirable and that there were uncertainties in the baling process. It was recommended that storage without processing be adopted, at least for plant startup. The method of waste storage was still under discussion.

22966 (EGG-LLW–9525) **Commercial radioactive waste minimization program development guidance.** Fischer, D.K. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1991. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93011395. Source: OSTI; NTIS; INIS; GPO Dep.

This document is one of two prepared by the EG&G Idaho, Inc., Waste Management Technical Support Program Group, National Low-Level Waste Management Program Unit. One of several Department of Energy responsibilities stated in the Amendments Act of 1985 is to provide technical assistance to compact regions Host States, and nonmember States (to the extent provided in appropriations acts) in establishing waste minimization program plans. Technical assistance includes, among other things, the development of technical guidelines for volume reduction options. Pursuant to this defined responsibility, the Department of Energy (through EG&G Idaho, Inc.) has prepared this report, which includes guidance on defining a program, State/compact commission participation, and waste minimization program plans.

22967 (EGG-WM–9185-Rev.1) **Waste minimization for commercial radioactive materials users generating low-level radioactive waste: Revision 1.** Fischer, D.K. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Gitt, M.; Williams, G.A.; Branch, S.; Otis, M.D.; McKenzie-Carter, M.A.; Schurman, D.L. EG and G Idaho, Inc., Idaho Falls, ID (United States); Science Applications International Corp., Idaho Falls, ID (United States). Jul 1991. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93011396. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this document is to provide a resource for all states and compact regions interested in promoting the minimization of low-level radioactive waste (LLW). This project was initiated by the Commonwealth of Massachusetts, and Massachusetts waste streams have been used as examples; however, the methods of analysis presented here are applicable to similar waste streams generated elsewhere. This document is a guide for states/compact regions to use in developing a system to evaluate and prioritize various waste minimization techniques in order to encourage individual radioactive materials users (LLW generators) to consider these techniques in their own independent evaluations. This review discusses the application of specific waste minimization techniques to waste streams characteristic of three categories of radioactive materials users: (1) industrial operations using radioactive materials in the manufacture of commercial products, (2) health care institutions, including hospitals and clinics, and (3) educational and research institutions. Massachusetts waste stream characterization data from key radioactive materials users in each category are used to illustrate the applicability of various minimization techniques. The utility group is not included because extensive information specific to this category of LLW generators is available in the literature.

22968 (EGG-WM–10533) **Treatability study for the bench-scale solidification of nonincinerable LDR low-level mixed waste.** Gering, K.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1993. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012189. Source: OSTI; NTIS; INIS; GPO Dep.

The focus of this report is the solidification of nonincinerable, land disposal restricted (LDR) low-level mixed waste generated at

the Idaho National Engineering Laboratory. Benchscale solidification was performed on samples of this mixed waste, which was done under a Resource Conservation and Recovery Act treatability study. Waste forms included liquids, sludges, and solids, and treatment techniques included the use of conventional Portland cement and sulphur polymer cement (SPC). A total of 113 monoliths were made under the experimental design matrix for this study; 8 of these were "blank" monoliths (contained no waste). Thus, 105 monoliths were used to solidify 21.6 kg of mixed waste; 92 were made with Portland cement systems, and 13 were made with SPC. Recipes for all monoliths are given, and suggested recipes (as based on the minimized leaching of toxic components) are summarized. In most cases, the results presented herein indicate that solidification was successful in immobilizing toxic metals, thereby transforming low-level mixed waste into low-level nonhazardous waste. The ultimate goal of this project is to use appropriate solidification techniques, as described in the literature, to transform low-level mixed waste to low-level nonhazardous waste by satisfying pertinent disposal requirements for this waste. Disposal requirements consider the toxicity characteristic leaching procedure tests, a free liquids test, and radiological analyses. This work is meaningful in that it will provide a basis for the disposal of waste that is currently categorized as LDR low-level mixed waste.

22969 (EGG-WM–10630) **Processing results of 1,800 gallons of mercury and radioactively contaminated mixed waste rinse solution.** Thiesen, B.P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1993. 147p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012166. Source: OSTI; NTIS; INIS; GPO Dep.

The mercury-contaminated rinse solution (INEL waste ID# 123; File 8 waste) was successfully treated at the Idaho National Engineering Laboratory (INEL). This waste was generated during the decontamination of the Heat Transfer Reactor Experiment 3 (HTRE-3) reactor shield tank. Approximately 1,800 gal of waste was generated and was placed into 33 drums. Each drum contained precipitated sludge material ranging from 1–10 in. in depth, with the average depth of about 2.5 in. The pH of each drum varied from 3–11. The bulk liquid waste had a mercury level of 7.0 mg/l, which exceeded the Resource Conservation and Recovery Act (RCRA) limit of 0.2 mg/l. The average liquid bulk radioactivity was about 2.1 pCi/ml, while the average sludge contamination was about 13,800 pci/g. Treatment of the waste required separation of the liquid from the sludge, filtration, pH adjustment, and ion exchange. Because of difficulties in processing, three trials were required to reduce the mercury levels to below the RCRA limit. In the first trial, insufficient filtration of the waste allowed solid particulate produced during pH adjustment to enter into the ion exchange columns and ultimately the waste storage tank. In the second trial, the waste was filtered down to 0.1 μ to remove all solid mercury compounds. However, before filtration could take place, a solid mercury complex dissolved and mercury levels exceeded the RCRA limit after filtration. In the third trial, the waste was filtered through 0.3-A filters and then passed through the S-920 resin to remove the dissolved mercury. The resulting solut

22970 (EGG-WTD–10539) **Buried Waste Integrated Demonstration FY-93 Deployment Plan.** Bonnenberg, R.W.; Heard, R.E.; Milam, L.M.; Watson, L.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012167. Source: OSTI; NTIS; INIS; GPO Dep.

The Buried Waste Integrated Demonstration (BWID) is a program funded by the US Department of Energy Office of Technology Development. BWID supports the applied research, development, demonstration, and evaluation of a suite of advanced technologies that together form a comprehensive remediation system for the effective and efficient remediation of buried waste. The fiscal year 1993 effort will deploy seven major field demonstrations at the Idaho National Engineering Laboratory's (INEL's) Radioactive Waste Management Complex Cold Test Pit. These major demonstrations are Remote Characterization System, Remote Excavation System, Overburden Removal, Waste Isolation, Contamination Control Unit, Rapid Monitoring Unit, and Fixation of Soil Surface Contamination. This document is the basic operational planning document for BWID deployment of the INEL field demonstrations. Additional sections deal briefly with four nonINEL field and laboratory demonstrations (Buried Waste Retrieval, Arc Melter Vitrification, Graphite DC Plasma Arc Melter, and Fixed Hearth Plasma Process) and with four INEL laboratory demonstrations (Electrostatic Curtain, Thermal Kinetics, Multiaxis Crane Control System, and Dig-Face Characterization).

22971 (EGG-WTD–10610) **Buried Waste Integrated Demonstration Strategy Plan.** Kostelnik, K.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012188. Source: OSTI; NTIS; INIS; GPO Dep.

The Buried Waste Integrated Demonstration (BWID) supports the applied research, development, demonstration, and evaluation of a suite of advanced technologies that form a comprehensive remediation system for the effective and efficient remediation of buried waste. These efforts are identified and coordinated in support of the US Department of Energy (DOE), Environmental Restoration and Waste Management (ERWM) needs and objectives. The present focus of BWID is to support retrieval and ex situ treatment configuration options. Future activities will explore and support containment and stabilization efforts in addition to the retrieval/ex situ treatment options. Long and short term strategies of the BWID are provided. Processes for identifying technological needs, screening candidate technologies for BWID applicability, researching technical issues, field demonstrating technologies, evaluating demonstration results to determine each technology's threshold of capability, and commercializing successfully demonstrated technologies for implementation for environmental restoration also are presented in this report.

22972 (EGG-WTD–10612) **Buried waste integrated demonstration fiscal year 1992 close-out report.** Cannon, P.G.; Kostelnik, K.M.; Owens, K.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012182. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Buried Waste Integrated Demonstration Program (BWID) is to support the development and demonstration of a suite of technologies that when integrated with commercially-available baseline technologies form a comprehensive remediation system for the effective and efficient remediation of buried waste disposed of throughout the US Department of Energy complex. To accomplish this mission of identifying technological solutions for remediation deficiencies, the Office of Technology Development initiated the BWID at the Idaho National Engineering Laboratory in fiscal year (FY)-91. This report summarizes the activities of the BWID Program during FY-92.

22973 (EGG-WTD–10674) **Supercritical waste oxidation pump investigation.** Thurston, G.; Garcia, K. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012184. Source: OSTI; NTIS; INIS; GPO Dep.

This report investigates the pumping techniques and pumping equipment that would be appropriate for a 5,000 gallon per day supercritical water oxidation waste disposal facility. The pumps must boost water, waste, and additives from atmospheric pressure to approximately 27.6 MPa (4,000 psia). The required flow ranges from 10 gpm to less than 0.1 gpm. For the higher flows, many commercial piston pumps are available. These pumps have packing and check-valves that will require periodic maintenance; probably at 2 to 6 month intervals. Several commercial diaphragm pumps were also discovered that could pump the higher flow rates. Diaphragm pumps have the advantage of not requiring dynamic seals. For the lower flows associated with the waste and additive materials, commercial diaphragm pumps. are available. Difficult to pump materials that are sticky, radioactive, or contain solids, could be injected with an accumulator using an inert gas as the driving mechanism. The information presented in this report serves as a spring board for trade studies and the development of equipment specifications.

22974 (ES/ER/TM–60) **Environmental Restoration Program pollution prevention performance measures for FY 1993 and 1994 remedial investigations: Generator training manual.** Oak Ridge National Lab., TN (United States); Weston (Roy F.), Inc., Oak Ridge, TN (United States). Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93010559. Source: OSTI; NTIS; INIS; GPO Dep.

This computer-based program is designed to help waste generators in the Environmental Restoration (ER) Program prevent pollution at the DOE Oak Ridge Field Office (DOE-OR) facilities in Oak Ridge, Paducah, and Portsmouth. The Numerical Scoring System (NSS) is an interactive system designed to maintain data on ER Program pollution prevention efforts and to measure the success of these efforts through the ER Program life cycle.

22975 (EUR–14366) **Immobilization of tritium enriched waste water from reprocessing by solidification as zirconium hydride.** Riedel, H.J. (Forschungszentrum Juelich GmbH (Germany)); Ullrich, W. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [173p.] (In German). Vertrag FI 1W0139D (B). Source: OSTI; NTIS (US Sales Only); INIS.

The different streams of waste water which are expected to arise from the operation of the Wackersdorf reprocessing plant were identified as well as their chemical and radiochemical composition. Before the enrichment of tritium by catalytic chemical exchange and electrolysis the remaining contaminations in the waste water must be removed by distillation. In the case of ^{131}I and ^{137}Cs, decontamination factors of 200-350 could be achieved. Other contaminations in the distillate were no longer detectable. An electrolyzer operating with a Solid Polymer Electrolyte, after a loading with 4×10^{-5} g of ions could no longer be operated. Comparative experiments were carried out with a TELEDYNE hydrogen generator HG-501. This device requires 35% KOH as the electrolyte solution. There is neither ^{131}I nor ^{137}Cs in the generated hydrogen - and oxygen - flow detectable. Up to 99% of the ^{131}I is fixed at the electrolytic cell. The operating life of the electrolytic cell is estimated to approx. 10 years, it therefore appears to be a suitable device if modified for operation with radioactive solutions containing tritium. Experiments on zirconium hydride formation served the purpose of determining suitable parameters for a trouble-free loading of zirconium sponge with tritium. Experimental results lead us to the proposal of a new concept for the formation of ZrHT and its final disposal. Batches of 100 g of zirconium sponge are hydrogenated. The HT gas can be directly fixed in batches of 22 litres. Accumulation and storage of the approx. 10 m^3 of HT gas is thus dispensed with. Since fairly small quantities of tritium and protium (180 Ci of tritium in 22 litres of HT gas) are handled per charge the accident potential is low. There is no need for a large-scale facility for handling and fixing HT which is only operated sporadically.

22976 (EUR–14466) **Decontamination of alpha-bearing solid wastes and plutonium recovery.** Koehly, G. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France)); Madic, C.; Lecomte, M.; Bourges, J.; Saulze, J.L.; Broudic, J.C. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [199p.] (In French). Contract FI1W/0013. Source: OSTI; NTIS (US Sales Only); INIS.

Nuclear activities in the Radiochemistry building of Fontenay-aux-Roses Nuclear Research Center concern principally the study of fuel reprocessing and the production of transuranium isotopes. During these activities solid wastes are produced. In order to improve the management of these wastes, it has been decided to build new facilities: a group of three glove-boxes named ELISE for the treatment of α active solid waste and a hot-cell, PROLIXE, for the treatment of solid wastes. Leaching processes were developed in order to: decontaminate these wastes and recover actinide elements, particularly the highly valuable plutonium, from the leachates. The processes developed are sufficiently flexible to be able to accommodate solid wastes produced in other facilities. Laboratory studies were conducted to develop the leaching process based on the use of electrogenerated Ag(II) species which is particularly suitable to provoke the dissolution of PuO_2. Successful exhaustive Pu decontaminations with DF(Pu) higher than 10^4 were achieved for the first time during the treatment of stainless steel PuO_2 cans (future MELOX plant) by electrogenerated Ag (II) in nitric acid medium.

22977 (GSF–23/90) **Further development of the methodical instruments to calculate ground water movements at repository sites.** Arens, G. (GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Braunschweig (Germany). Inst. fuer Tieflagerung); Clauser, C.; Fein, E.; Karpinski, P.; Storck, R. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Jun 1990. 114p. (In German). Contract BMFT KWA 5408. (GSF-TL–14/90). Order Number DE93792549. Source: OSTI; NTIS (US Sales Only); INIS.

In addition to the subsequent requirements concerning the Konrad plan approval procedure, other ground water and propagation calculations were also made. All available programs were used. Simple one- and two-dimensional models were considered for which an analytical solution exists. In some cases such analytical solutions are only approximate under certain conditions. By calculating such simple problems, the programs used were tested and verified, and the use of those programs was reviewed and documented. In addition to the finite-difference program SWIFT and the finite-element program CFEST, two other ground water and propagation programs were applied: (1) Finite-difference program MOL, two-dimensional propagation program for ground water flow; (2) SUTRA, two-dimensional hybrid finite-element and integrated finite-difference model for ground water flow and radionuclide migration. (orig./HP).

22982 (JAERI-M–93-077) **Adherent behavior of radioactive volatile substance on canister.** Togashi, Yoshihiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Tashiro, Shingo. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 17p. (In Japanese). Order Number DE93797612. Source: OSTI; NTIS; INIS.

To clarify the adherent behavior of radioactive volatile substance to stainless steel which is used for the canister of glass solidification waste, contaminating and decontaminating tests were carried out on the basis of ^{137}Cs as a typical volatile substance. It was confirmed that the adhesion of the volatilized radioactive cesium on the stainless steel was almost loose contamination. The rate of the loose contamination increased with the contaminating time. The fixed contamination increased with the contaminating temperature. It was also found that the SUS309S stainless steel had a tendency to be contaminated as compared with SUS304L stainless steel and the contamination depended on the surface roughness of the stainless steel. (author).

22983 (K/CWM–18) **[Information exchange on current and planned low-level and transuranic waste management practices]: Foreign trip report, November 1–12, 1992.** Mezga, L.J. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)); Radcliffe, L.L. Oak Ridge K-25 Site, TN (United States). 18 Jan 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE93008859. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler participated in discussions with British Nuclear Fuels Ltd. (BNFL) personnel regarding current low-level waste (LLW) and transuranic waste (TRU) management practices and procedures at the Sellafield Nuclear Facility. Specific discussion topics included LLW disposal practices at the Drigg Site, plutonium contaminated materials (PCM) management activities, waste characterization and certification programs and practices, and the status of repository development for low and intermediate level wastes (LLW and ILW) in the United Kingdom. Visits were made to the LLW disposal facility at Drigg, the high-level waste (HLW) vitrification facility, the waste treatment complex, the Waste Compaction and Monitoring Plant, an exploratory well site for the proposed LLW and ILW repository, and several plutonium - contaminated materials storage areas. This visit was conducted in conjunction with a subsequent visit to the SFR, the Swedish repository for LLW and ILW; the Studsvik Nuclear Research Facility; and the Forsmark Reactor.

22984 (K/ER–56) **Electromagnetic survey of the K1070A burial ground at the Oak Ridge K-25 Site, Oak Ridge, Tennessee: Environmental Restoration Program.** Nyquist, J.E.; Emery, M.S. Oak Ridge K-25 Site, TN (United States). Jan 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE93008690. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication 3988.

The K1070A burial ground, located at the K-25 Site on the Oak Ridge Reservation, received chemical and radioactive wastes from the late 1940s until 1975. Analysis of water samples collected from nearby monitoring wells indicates that contamination is migrating offsite. In November 1991, Oak Ridge National Laboratory (ORNL) personnel collected high-resolution electrical terrain conductivity data at the K1070A burial ground. A Model EM31 terrain conductivity meter manufactured by Geonics Limited was used in conjunction with the ORNL-developed Ultrasonic Ranging and Data System (USRADS) to perform the survey. The purposeof the survey was to provide Environmental Restoration (ER) staff with a detailed map of the spatial variation of the apparent electrical conductivity of the shallow subsurface (upper 3 m) to assist them in siting future monitoring wells closer to the waste area without drilling into the buried waste.

22985 (K/QT–389) **Effluent testing for the Oak Ridge mixed waste incinerator: Emissions test for August 27, 1990.** Bostick, W.D.; Bunch, D.H.; Gibson, L.V.; Hoffmann, D.P.; Shoemaker, J.L. Oak Ridge K-25 Site, TN (United States). Dec 1990. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE93009333. Source: OSTI; NTIS; INIS; GPO Dep.

On August 27, 1990, a special emissions test was performed at the K-1435 Toxic Substance Control Act Mixed Waste Incinerator. A sampling and analysis plan was implemented to characterize the incinerator waste streams during a 6 hour burn of actual mixed waste. The results of this characterization are summarized in the present report. Significant among the findings is the observation that less than 3% of the uranium fed to the incinerator kiln was discharged as stack emission. This value is consistent with the estimate of 4% or less derived from long-term mass balance of previous operating experience and with the value assumed in the original Environmental Impact Statement. Approximately 1.4% of the total uranium fed to the incinerator kiln appeared in the aqueous scrubber blowdown; about 85% of the total uranium in the aqueous waste was insoluble (i.e., removable by filtration). The majority of the uranium fed to the incinerator kiln appeared in the ash material, apparently associated with phosphorous as a sparingly-soluble species. Many other metals of potential regulatory concern also appeared to concentrate in the ash as sparingly-soluble species, with minimal partition to the aqueous waste. The aqueous waste was discharged to the Central Neutralization Facility where it was effectively treated by coprecipitation with iron. The treated, filtered aqueous effluent met Environmental Protection Agency interim primary drinking water standards for regulated metals.

22986 (LA–12446-MS) **The nondestructive assay of 55-gallon drums containing uranium and transuranic waste using passive-active shufflers.** Rinard, P.M.; Adams, E.L.; Menlove, H.O.; Sprinkle, J.K. Jr. Los Alamos National Lab., NM (United States). Nov 1992. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008854. Source: OSTI; NTIS; INIS; GPO Dep.

This study has been completed to characterize and improve the performance of passive-active neutron (PAN) shufflers in assaying 55gal. drums of nuclear facility waste for uranium and transuranic elements. Over 1700 active measurements and 800 passive measurements were made using 28 different matrices. Some of the matrices had homogeneous distributions of known amounts of moderating and absorbing materials, whereas others were less well characterized. Some of the well-characterized matrices simulate facility waste better than the others,especially matrices of paper, iron, polyethylene in nine different densities (with and without neutron poisons), alumina trap material, and concrete blocks.

22987 (LA–12528) **Partitioning high-level waste from alkaline solution: A literature survey.** Marsh, S.F. Los Alamos National Lab., NM (United States). May 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93013595. Source: OSTI; NTIS; INIS; GPO Dep.

Most chemical partitioning procedures are designed for acidic feed solutions. However, the high-level waste solutions in the underground storage tanks at US Department of Energy defense production sites are alkaline. Effective partitioning procedures for alkaline solutions could decrease the need to acidify these solutions and to dissolve the solids in acid, which would simplify subsequent processing and decrease the generation of secondary waste. The author compiles candidate technologies from his review of the chemical literature, experience, and personal contacts. Several of these are recommended for evaluation.

22988 (LA-SUB–92-12-Vol.1) **Impact of DOE Orders on Waste Management Operation: Volume 1: [Final report].** Klein, R.B. (Rogers and Associates Engineering Corp., Salt Lake City, UT (United States)); Jennrich, E.A.; Shuman, R.; Sandquist, G.M.; Rutz, A.C.; Littleton, M.W.; McCauce, C.H. Los Alamos National Lab., NM (United States); Rogers and Associates Engineering Corp., Salt Lake City, UT (United States); Wastren, Inc., Idaho Falls, ID (United States). Sep 1989. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (RAE–8915/2-1). Order Number DE93008404. Source: OSTI; NTIS; INIS; GPO Dep.

Department of Energy Orders are the internal documents which govern the management of all Department of Energy facilities and operations. DOE Orders are the vehicles by which Federal and state laws and regulations are applied to Department of Energy activities. A selected set of 22 Department of Energy Orders was reviewed to identify the applicability and impact of each Order on waste management operations at Los Alamos National Laboratory. Of the 22 Orders reviewed, five set forth requirements which have a high degree of impact on waste management activities. Eight Orders have a moderate degree of impact on waste management activities, and the remaining nine Orders have a low degree of impact.

22989 (LA-SUB–92-12-Vol.2) **Engineering assessment of mixed waste management options: Volume 2: [Final report].** Davis, K.D. (Wastren, Inc., Idaho Falls, ID (United States)); Klein, R.B.; Jennrich, E.A. Los Alamos National Lab., NM (United States); Rogers and Associates Engineering Corp., Salt Lake City, UT (United States); Wastren, Inc., Idaho Falls, ID (United States). Dec 1989. 179p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (RAE–8915/3-2). Order Number DE93008405. Source: OSTI; NTIS; INIS; GPO Dep.

An engineering assessment of the low-level radioactive mixed waste (contains both radioactive and hazardous constituents) management program at Los Alamos National Laboratory was performed during the summer and fall of 1989. The assessment was aimed at developing recommendations for upgrading existing or developing new mixed waste treatment, storage, characterization, and disposal capabilities at the facility. The assessment was initiated with a comparison of actual waste containers in storage to (1) the records maintained on those wastes and to (2) planning estimates of the types and rates of mixed wastes produced. The various types of mixed waste, calculated in this study to be generated at an annual rate of 160 cubic meters (projected from 1989 data), were categorized into 30 groupings of similar characteristics. These groupings were further combined by the types of treatment required to allow the waste to be disposed in accordance with EPA requirements. Three broad categories of treatment needs were thus generated and potential treatment processes and methods to satisfy these needs were identified. On-site laboratory capabilities to perform analytical characterization of mixed waste were reviewed.

22990 (LA-SUB–93-51) **The Lathrop Wells volcanic center: Status of field and geochronology studies.** Crowe, B. (Los Alamos National Lab., Las Vegas, NV (United States)); Morley, R.; Wells, S.; Geissman, J.; McDonald, E.; McFadden, L.; Perry, F.; Murrell, M.; Poths, J.; Forman, S. Los Alamos National Lab., NM (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008917. Source: OSTI; NTIS; INIS; GPO Dep.

The Lathrop Wells volcanic center is located 20 km south of the potential Yucca Mountain site, at the south end of the Yucca Mountain range. It has long been recognized as the youngest basalt center in the region. However, determination of the age and eruptive history of the center has proven problematic. The purpose of this paper is to describe the status of field and geochronology studies of the Lathrop Wells center. Our perspective is that it is critical to assess all possible methods for obtaining cross-checking data to resolve chronology and field problems. It is equally important to consider application of the range of chronology methods available in Quaternary geologic research. Such an approach seeks to increase the confidence in data interpretations through obtaining convergence among separate isotopic, radiogenic, and age-correlated methods. Finally, the assumptions, strengths, and weaknesses of each dating method need to be carefully described to facilitate an impartial evaluation of results.

22991 (LA-SUB–93-92) **Recommendations for future low-level and mixed waste management practices at Los Alamos National Laboratory.** Jennrich, E.A. (Rogers and Associates Engineering Corp., Salt Lake City, UT (United States)); Klein, R.B.; Murphy, E.S.; Shuman, R.; Hickman, W.W.; Rutz, A.C.; Uhl, D.L. Los Alamos National Lab., NM (United States); Rogers and Associates Engineering Corp., Salt Lake City, UT (United States); Wastren, Inc., Idaho Falls, ID (United States). 27 Apr 1989. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (RAE–8915-1). Order Number DE93008679. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes recommendations concerning the management of low-level radioactive wastes and mixtures at Los Alamos National Laboratory. Performance assessments, characterization, site disposal design, shipment, and storage are discussed.

22992 (LA-UR–93-456) **Destruction of nitrates, organics, and ferrocyanides by hydrothermal processing.** Robinson, J.M.; Foy, B.R.; Dell'Orco, P.C.; Anderson, G.; Archuleta, F.; Atencio, J.; Breshears, D.; Brewer, R.; Eaton, H.; McFarland, R.; McInroy, R.; Reynolds, T.; Sedillo, M.; Wilmanns, E.; Buelow, S.J. Los Alamos National Lab., NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States); Associated Western Universities, Inc., Salt Lake City, UT (United States). DOE Contract W-7405-ENG-36. (CONF-930205–23: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93008714. Source: OSTI; NTIS; INIS; GPO Dep.

This work targets the remediation of the aqueous mixed wastes stored in the underground tanks at the Department of Energy site in Hanford, Washington via hydrothermal processing. The feasibility of destroying the nitrate, organic, and ferrocyanide components of the wastes under supercritical and near critical conditions (623 °K to 873°K, 22.1 MPa to 103.4 MPa) is addressed. A novel method was developed for determining the solubility of nitrate salts in supercritical water solutions at pressures ranging from 24.8 MPa to 30.3 MPa (3600 psi to 4400 psi) and temperatures from 723 °K to 798 °K. Sodium nitrate solubilities ranged from 293 mg/kg at 24.8 MPa and 798 °K to 1963 mg/kg at 30.3 MPa and 723°K. Solubility was found to vary directly with pressure, and inversely with temperature. An empirical relationship was developed for the estimation of sodium nitrate solubility at water densities between 0.08 and 0.16 kg/L and temperatures between 723°K and 798°K. A small volume batch reactor equipped with optical diagnostics was used to monitor the phase behavior of a diluted variant of a tank 101-SY simulant. Preliminary results suggest that a single phase is formed at 83 MPa at 773 °K.

22993 (LA-UR–93-656) **Migration barrier covers for radioactive and mixed waste landfills.** Hakonson, T.E. (Los Alamos National Lab., NM (United States)); Manies, K.L.; Warren, R.W.; Bostick, K.V.; Trujillo, G.; Kent, J.S.; Lane, L.J. Los Alamos National Lab., NM (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930188–1: Environmental restoration technology transfer symposium, Salt Lake City, UT (United States), 26-28 Jan 1993). Order Number DE93008728. Source: OSTI; NTIS; INIS; GPO Dep.

Migration barrier cover technology will likely serve as the remediation alternative of choice for most of DOE's radioactive and mixed waste landfills simply because human and ecological risks can be effectively managed without the use of more expensive alternatives. However, very little testing and evaluation has been done, either before or after installation, to monitor how effective they are in isolating waste or to develop data that can be used to evaluate model predictions of long term performance. Los Alamos National Laboratory has investigated the performance of a variety of landfill capping alternatives since 1981 using large field lysimeters to monitor the fate of precipitation falling on the cap surface. The objective of these studies is to provide the risk manager with a variety of field tested capping designs, of various complexities and costs, so that design alternatives can be matched to the need for hydrologic control at the site. Four different landfill cap designs, representing different complexities and costs, were constructed at Hill Air Force Base (AFB) in October and November, 1989. The designs were constructed in large lysimeters and instrumented to provide estimates of all components of water balance including precipitation, runoff (and soil erosion), infiltration, leachate production, evapotranspiration, and capillary/hydraulic barrier flow. The designs consisted of a typical soil cover to serve as a baseline, a modified EPA RCRA cover, and two versions of a Los Alamos design that contained erosion control measures, an improved vegetation cover to enhance evapotranspiration, and a capillary barrier to divert downward flow of soil water. A comprehensive summary

of the Hill AFB demonstration will be available in October 1993, when the project is scheduled to terminate.

22994 (LA-UR–93-697) **Oxygen sparging of residue salts.** Garcia, E.; Griego, W.J.; Owens, S.D.; Thorn, C.W.; Vigil, R.A. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930571–7: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93008724. Source: OSTI; NTIS; GPO Dep.

Oxygen sparge is a process for treating salt residues at Los Alamos National Laboratory by sparging oxygen through molten salts. Oxygen reacts with the plutonium trichloride in these salts to form plutonium dioxide. There is further reaction of the plutonium dioxide with plutonium metal and the molten salt to form plutonium oxychloride. Both of the oxide plutonium species are insoluble in the salt and collect atthe bottom of the crucible. This results in a decrease of a factor of 2–3 in the amount of salt that must be treated, and the amount of waste generated by aqueous treatment methods.

22995 (LA-UR–93-998) **Application of geographic information systems to waste minimization efforts at Los Alamos National Laboratory.** Lyttle, T.W.; Smith, D.M.; Burns, M.; Weinrach, J.B. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930523–1: 18. National Association of Environmental Professionals (NAEP) annual conference on current and future priorities for environmental management, Raleigh, NC (United States), 24-26 May 1993). Order Number DE93010726. Source: OSTI; NTIS; INIS; GPO Dep.

At Los Alamos National Laboratory (LANL), facility waste streams tend to be small but highly diverse. Initial characterization of such waste streams is often difficult in part due to a lack of tools to assist the generators themselves in completing such assessments. A methodology has been developed at LANL to allow process knowledgeable field personnel to develop baseline waste generation assessments and to evaluate potential waste minimization technology. This Process Waste Assessment (PWA) system is an application constructed within the Process Modeling System and currently being integrated with the InFoCAD Geographic Information System (GIS) . The Process Modeling System (PMS) is an object-oriented, mass balance-based, discrete-event simulation framework written using the Common Lisp Object System (CLOS) . Analytical capabilities supported within the PWA system include: complete mass balance specifications, historical characterization of selected waste streams and generation of facility profiles for materials consumption, resource utilization and worker exposure. Development activities include integration with the LANL facilities management Geographic Information System (GIS) and provisions for a Best Available Technologies (BAT) database. The environments used to develop these assessment tools will be discussed in addition to a review of initial implementation results.

22996 (LA-UR–93-1197) **Advanced oxidation and reduction processes: Closed-loop applications for mixed waste.** Coogan, J.J.; Tennant, R.A.; Rosocha, L.A.; Wantuck, P.J. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930873–8: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93012624. Source: OSTI; NTIS; INIS; GPO Dep.

At Los Alamos we are engaged in applying innovative oxidation and reduction technologies to the destruction of hazardous organics. Non thermal plasmas and relativistic electron-beams both involve the generation of free radicals and are applicable to a wide variety of mixed waste as closed-loop designs can be easily engineered. Silent discharge plasmas (SDP), long used for the generation of ozone, have been demonstrated in the laboratory to be effective in destroying hazardous organic compounds and offer an alternative to existing post-incineration and off-gas treatments. SDP generates very energetic electrons which efficiently create reactive free radicals, without adding the enthalpy associated with very high gas temperatures. A SDP cell has been used as a second stage to a LANL designed, packed-bed reactor (PBR) and has demonstrated DREs as high as 99.9999% for a variety of combustible liquid and gas-based waste streams containing scintillation fluids, nitrates, PCB surrogates, and both chlorinated and fluorinated solvents. Radiolytic treatment of waste using electron-beams and/or bremsstrahlung can be applied to a wide range of waste media (liquids, sludges, and solids). The efficacy and economy of these systems has been demonstrated for aqueous waste through both laboratory and pilot scale studies. We win present recent experimental and theoretical results for systems using stand alone SDP, combined PBR/SDP, and electron-beam treatment methods.

22997 (LA-UR–93-1204) **Treating water-reactive wastes.** Lussiez, G.W. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930873–9: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93012661. Source: OSTI; NTIS; INIS; GPO Dep.

Some compounds and elements, such as lithium hydride, magnesium, sodium, and calcium react violently with water to generate much heat and produce hydrogen. The hydrogen can ignite or even form an explosive mixture with air. Other metals may react rapidly only if they are finely divided. Some of the waste produced at Los Alamos National Laboratory includes these metals that are contaminated with radioactivity. By far the greatest volume of water-reactive waste is lithium hydride contaminated with depleted uranium. Reactivity of the water-reactive wastes is neutralized with an atmosphere of humid nitrogen, which prevents the formation of an explosive mixture of hydrogen and air. When we adjust the temperature of the nitrogen and the humidifier, the nitrogen can be more or less humid, and the rate of reaction can be adjusted and controlled. Los Alamos has investigated the rates of reaction of lithium hydride as a function of the temperature and humidity, and, as anticipated, they in with in temperature and humidity. Los Alamos will investigate other variables. For example, the nitrogen flow will be optimized to conserve nitrogen and yet keep the reaction rates high. Reaction rates will be determined for various forms of lithium waste, from small chips to powder. Bench work will lead to the design of a skid-mounted process for treating wastes. Other water-reactive wastes will also be investigated.

22998 (LBL–32874) **Radionuclide solubility and speciation studies for the Yucca Mountain site characterization project.** Nitsche, H.; Roberts, K.; Prussin, T.; Keeney, D.; Carpenter, S.A.; Becraft, K.; Gatti, R.C. Lawrence Berkeley Lab., CA (United States). Dec 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930408–53: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93010444. Source: OSTI; NTIS; INIS; GPO Dep.

Yucca Mountain, Nevada, USA, is being investigated for its suitability as a potential site for a geologic nuclear waste repository. As part of the site characterization studies, actinide solubilities and speciations were studied at pH 6, 7, and 8.5 at 25°C in two different groundwaters from the vicinity of Yucca Mountain. The groundwaters differ substantially in total dissolved carbonate concentration, and to a lesser extent in ionic strength. In the waters with higher carbonate content, the solubilities of neptunium(V) decreased, whereas those americium(III) increased at 25°KC and decreased at 60°C. The solids formed were sodium neptunium carbonates and americium hydroxycarbonates. Plutonium solubilities did not significantly change with changing water composition because the solubility-controlling solids were mostly amorphous Pu(IV) polymers that contained only small amounts of carbonate.

22999 (LBL–33447) **Flow visualization and relative permeability measurements in rough-walled fractures.** Persoff, P.; Pruess, K. Lawrence Berkeley Lab., CA (United States). Jan 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930408–72: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93013908. Source: OSTI; NTIS; INIS; GPO Dep.

Two-phase (gas-liquid) flow experiments were done in a natural rock fracture and transparent replicas of natural fractures. Liquid was injected at constant volume flow rate, and gas was injected at

either constant mass flow rate or constant pressure. When gas was injected at constant mass flow rate, the gas inlet pressure, and inlet and outlet capillary pressures, generally did not reach steady state but cycled irregularly. Flow visualization showed that this cycling was due to repeated blocking and unblocking of gas flow paths by liquid. Relative permeabilities calculated from flow rate and pressure data show that the sum of the relative permeabilities of the two phases is much less than 1, indicating that each phase interferes strongly with the flow of the other. Comparison of the relative permeability curves with typical curves for porous media (Corey curves) show that the phase interference is stronger in fractures than in typical porous media.

23000 (LBL–33464) **An inverse procedure for estimating the unsaturated hydraulic conductivities of volcanic tuffs.** Zimmerman, R.W. (Lawrence Berkeley Lab., CA (United States)); Bodvarsson, G.S.; Flint, A.L.; Flint, L.E. Lawrence Berkeley Lab., CA (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;AI08-78ET44802. (CONF-930408–50: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93010421. Source: OSTI; NTIS; INIS; GPO Dep.

A procedure is developed for estimating the hydraulic conductivity function of unsaturated volcanic tuff, using measurements of the sorptivity and capillary pressure functions. The method assumes that the sorptivity is a linear function of the initial saturation, as is suggested by experimental data. The procedure is tested on a vitrified tuff from the Calico Hills unit at Yucca Mountain, and the predicted conductivities are in reasonable agreement with measured values. Further tests of this method are needed to establish whether or not it can be routinely used for conductivity predictions.

23001 (LBL–33614) **Geophysical methods for fracture characterization in and around potential sites for nuclear waste disposal.** Majer, E.L. (Lawrence Berkeley Lab., CA (United States)); Lee, K.H.; Morrison, H.F. Lawrence Berkeley Lab., CA (United States). Aug 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920866–5: American Society of Civil Engineers (ASCE) symposium on dynamic analysis and design considerations, for high-level nuclear waste repositories, San Francisco, CA (United States), 19-20 Aug 1992). Order Number DE93010411. Source: OSTI; NTIS; INIS; GPO Dep.

Historically, geophysical methods have been used extensively to successfully explore the subsurface for petroleum, gas, mineral, and geothermal resources. Their application, however, for site characterization, and monitoring the performance of near surface waste sites or repositories has been somewhat limited. Presented here is an overview of the geophysical methods that could contribute to defining the subsurface heterogeneity and extrapolating point measurements at the surface and in boreholes to volumetric descriptions in a fractured rock. In addition to site characterization a significant application of geophysical methods may be in performance assessment and in monitoring the repository to determine if the performance is as expected.

23002 (LBL–33660) **Single fracture aperture patterns: Characterization by slit-island fractal analysis.** Cox, B.L.; Wang, J.S.Y. Lawrence Berkeley Lab., CA (United States). Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930408–49: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93010413. Source: OSTI; NTIS; INIS; GPO Dep.

Single fracture measurements are difficult to obtain, but they are the only means we have to observe and study natural fracture morphology. The character of the fracture openings (apertures) is often one of the primary factors controlling fluid flow in the fracture. In particular, the shape, distribution, and connectivity of contact areas and flow channels can affect the relative permeability of wetting and non-wetting fluid phases in unsaturated systems. In this paper we use three methods of fractal analysis (the slit-island, the divider, and the variogram) as well as statistical and geostatistical analysis to characterize the geometry of measured fracture apertures obtained from two different fractured rock specimens from the field. One of these is a granitic fracture (crack) of homogeneous lithology and no displacement, the other is a fracture (fault) obtained from a highly altered fault zone, containing striations and slickensides. We discuss the fractal and geostatistical analysis of these two fractures in the context of what information is most helpful for making predictions about fluid flow in single fractures.

23003 (LBL–33661) **The role of fault zones in affecting multiphase flow at Yucca Mountain.** Tsang, Y.W.; Pruess, K.; Wang, J.S.Y. Lawrence Berkeley Lab., CA (United States). Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930408–52: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93010431. Source: OSTI; NTIS; INIS; GPO Dep.

Within Yucca Mountain, the potential High Level Nuclear-Waste Repository site, there are large scale fault zones, most notably the Ghost Dance Fault. The effect of such high-permeability, large scale discontinuities on the flow and transport is a question of concern in assessing the ability of the site to isolate radio-nuclides from the biosphere. In this paper, we present a numerical study to investigate the role of the fault in affecting both the liquid and gas phase flows in the natural state at Yucca Mountain prior to waste emplacement, as well as after the waste emplacement when the fluid flow is strongly heat-driven. Our study shows that if the characteristic curves of the Ghost Dance Fault obey the same relationship between saturated permeability and capillary scaling parameter, as is observed from the measured data of Yucca Mountain welded and nonwelded tuffs. Apache Leap tuffs, and Las Cruces soil, then a large saturated permeability of the Ghost Dance Fault will play little role in channeling water into the fault, or inenhancing the flow of water down the fault. However, the Fault may greatly enhance the upward gas flow after emplacement of waste. This may have implications on the transport of gaseous radionuclides such as C^{14}. The results of this study also focus attention on the need for field measurements of fluid flow in the fault zones.

23004 (LBL–33663) **Flow and transport in hierarchically fractured systems.** Karasaki, K. Lawrence Berkeley Lab., CA (United States). Jan 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930408–48: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93010414. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary results indicate that flow in the saturated zone at Yucca Mountain is controlled by fractures. A current conceptual model assumes that the flow in the fracture system can be approximately by a three-dimensionally interconnected network of linear conduits. The overall flow system of rocks at Yucca Mountain is considered to consist of hierarchically structured heterogeneous fracture systems of multiple scales. A case study suggests that it is more appropriate to use the flow parameters of the large fracture system for predicting the first arrival time, rather than using the bulk average parameters of the total system.

23005 (NEI-NO–332) **Storage for low-level and intermediate-level radioactive wastes: Consequence report in accordance with the Plan- and buildingregulation.** Statens Bygge- og Eiendomsdirekorat, Oslo (Norway). Nov 1992. [97p.] (In Norwegian). Order Number DE93626427. Source: OSTI; NTIS; INIS.

The objective of this report was to assess whether three nominated sites in Norway for underground storage of low-level and intermediate-level radioactive wastes would comply with safety standards and applicable laws and regulations. The site selection criteria are described and the report evaluates the technical, environmental and socio-economic suitability of the different sites. The site selection process eliminated two of the nominated sites, whereas one site was singled out. 28 refs., 14 figs., 10 tabs.

23006 (NUREG/CR–5917-Vol.1) **Sensitivity and uncertainty analyses applied to one-dimensional radionuclide transport in a layered fractured rock: MULTFRAC –Analytic solutions and local sensitivities: Phase 2, Iterative performance assessment: Volume 1.** Gureghian, A.B. (Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory

Analyses); Wu, Y.T.; Sagar, B.; Codell, R.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of High-Level Waste Management; Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory Analyses. Dec 1992. 131p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (CNWRA–91-010-Vol.1). Source: OSTI; NTIS; INIS; GPO.

Includes 1 sheet of microfiche supplement.

Exact analytical solutions based on the Laplace transforms are derived for describing the one-dimensional space-time-dependent, advective transport of a decaying species in a layered, saturated rock system intersected by a planar fracture of varying aperture. These solutions, which account for advection in fracture, molecular diffusion into the rock matrix, adsorption in both fracture and matrix, and radioactive decay, predict the concentrations in both fracture and rock matrix and the cumulative mass in the fracture. The solute migration domain in both fracture and rock is assumed to be semi-infinite with non-zero initial conditions. The concentration of each nuclide at the source is allowed to decay either continuously or according to some periodical fluctuations where both are subjected to either a step or band release mode. Two numerical examples related to the transport of Np-237 and Cm-245 in a five-layered system of fractured rock were used to verify these solutions with several well established evaluation methods of Laplace inversion integrals in the real and complex domain. In addition, with respect to the model parameters, a comparison of the analytically derived local sensitivities for the concentration and cumulative mass of Np-237 in the fracture with the ones obtained through a finite-difference method of approximation is also reported.

23007 (NVO–325LRD-Rev.1) **Nevada Test Site defense waste acceptance criteria, certification, and transfer requirements laboratory reference document: Revision 1.** USDOE Nevada Field Office, Las Vegas, NV (United States); Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Reference document NVO–325LRD-Rev.1.

The Nevada Test Site Defense Waste Acceptance Criteria, Certification, and Transfer Requirements establishes procedures, requirements, and criteria for safe transfer and disposal of low-level and mixed waste and storage of transuranic and transuranic mixed waste at the NTS. Included are the following: overview of the NTS Defense Waste Management Program, guidance for the application to dispose or store waste, the NTS waste acceptance criteria including the waste characterization certification requirements, and requirements for waste receipt.

23009 (NWPO-SE–045-92) **Social impacts of hazardous and nuclear facilities and events: Implications for Nevada and the Yucca Mountain high-level nuclear waste repository: [Final report].** Freudenburg, W.R. (Wisconsin Univ., Madison, WI (United States)); Carter, L.F.; Willard, W.; Lodwick, D.G.; Hardert, R.A.; Levine, A.G.; Kroll-Smith, S.; Couch, S.R. Nevada Nuclear Waste Project Office, Carson City, NV (United States). May 1992. 304p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG08-85NV10461. Order Number DE93013217. Source: OSTI; NTIS; INIS; GPO Dep.

Social impacts of a nuclear waste repository are described. Various case studies are cited such as Rocky Flats Plant, the Feed Materials Production Center, and Love Canal. The social impacts of toxic contamination, mitigating environmental stigma and loss of trust are also discussed.

23010 (NWPO-SE–054-92) **Expert judgment in assessing radwaste risks: What Nevadans should know about Yucca Mountain: [Final report].** Shrader-Frechette, K. (University of South Florida, Tampa, FL (United States)). Nevada Nuclear Waste Project Office, Carson City, NV (United States). Jun 1992. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG08-85NV10461. Order Number DE93013216. Source: OSTI; NTIS; INIS; GPO Dep.

For phenomena characterized by accurate and largely complete data, quantitative risk assessment (QRA) provides extraordinarily valuable and objective information. However, with phenomena for which the data, models, or probabilities are incomplete or uncertain, QRA may be less useful and more questionable, because its conclusions are typically empirically and theoretically underdetermined. In the face of empirical or theoretical underdetermination, scientists often are forced to make a number of methodological value judgments and inferences about how to estimate and evaluate the associated risks. The purpose of this project is to evaluate instances of methodological value judgments and invalid or imprecise inferences that have occurred in the QRA done for the proposed Yucca Mountain high-level radioactive waste facility. We shall show (1) that questionable methodological value judgments and inferences have occurred in some Yucca Mountain QRA'S; (2) that questionable judgments and inferences, similar to those in the Yucca Mountain studies, have occurred in previous QRA's done for other radiation-related facilities and have likely caused earlier QRA's to err in specific ways; and (3) that, because the value judgments and problems associated with some Yucca Mountain QRA's include repetitions of similar difficulties in earlier studies, therefore the QRA conclusions of some Yucca Mountain analyses are, at best, uncertain.

23011 (NWPO-TR–017-91) **Quaternary tectonics and basin history of Pahrump and Stewart Valleys, Nevada and California.** Hoffard, J.L. (Nevada Univ., Reno, NV (United States)). Nevada Nuclear Waste Project Office, Carson City, NV (United States); Nevada Univ., Reno, NV (United States). May 1991. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG08-85NV10461. Order Number DE93013214. Source: OSTI; NTIS; INIS; GPO Dep.

The Pahrump fault system is an active fault system located in Pahrump and Stewart Valleys, Nevada and California, in the southern part of the Basin and Range Province. This system is 50 km long by 30 km wide and is comprised of three fault zones: the right-lateral East Nopah fault zone, the right-oblique Pahrump Valley fault zone, and the normal West Spring Mountains fault zone. All three zones have geomorphic evidence for late Quaternary activity. Analysis of active fault patterns and seismic reflection lines suggests that the Pahrump basin has had a two-stage genesis, an early history associated with a period of low angle detachment faulting probably active 10-15 Ma, and a more recent history related to the present dextral shear system, probably active post-4 Ma.

23012 (NWPO-TR–018-91) **Mesozoic and Cenozoic structural geology of the CP Hills, Nevada Test Site, Nye County, Nevada; and regional implications.** Caskey, S.J. (Nevada Univ., Reno, NV (United States)). Nevada Nuclear Waste Project Office, Carson City, NV (United States); Nevada Univ., Reno, NV (United States). Aug 1991. 203p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG08-85NV10461. Order Number DE93013215. Source: OSTI; NTIS; INIS; GPO Dep.

Detailed mapping and structural analysis of upper Proterozoic and Paleozoic rocks in the CP Hills of the Nevada Test Site, together with analysis of published maps and cross sections and a reconnaissance of regional structural relations indicate that the CP thrust of Barnes and Poole (1968) actually comprises two separate, oppositely verging Mesozoic thrust systems: (1) the west-vergent CP thrust which is well exposed in the CP Hills and at Mine Mountain, and (2) the east-vergent Belted Range thrust located

northwest of Yucca Flat. West-vergence of the CP thrust is indicated by large scale west-vergent recumbent folds in both its hangingwall and footwall and by the fact that the CP thrust ramps up section through hangingwall strata toward the northwest. Regional structural relations indicate that the CP thrust forms part of a narrow sigmoidal belt of west-vergent folding and thrusting traceable for over 180 km along strike. The Belted Range thrust represents earlier Mesozoic deformation that was probably related to the Last Chance thrust system in southeastern California, as suggested by earlier workers. A pre-Tertiary reconstruction of the Cordilleran fold and thrust belt in the region between the NTS and the Las Vegas Range bears a close resemblance to other regions of the Cordillera and has important implications for the development of hinterland-vergent deformation as well as for the probable magnitude of Tertiary extension north of Las Vegas Valley. Subsequent to Mesozoic deformation, the CP Hills were disrupted by at least two episodes of Tertiary extensional deformation: (1) an earlier episode represented by pre-middle Miocene low-angle normal faults, and (2) a later, post-11 Ma episode of high-angle normal faulting. Both episodes of extension were related to regional deformation, the latter of which has resulted in the present basin and range topography of the NTS region.

23013 (ORNL/FTR–4473) **[Principles and criteria for radioactive waste disposal]: Foreign trip report, October 24–30, 1992.** Kocher, D.C. Oak Ridge National Lab., TN (United States). 13 Nov 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009778. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended, as a representative of the U. S. Department of Energy, the second meeting of the International Radioactive Waste Management Advisory Committee Subgroup on Principles and Criteria for Radioactive Waste Disposal. The primary purpose of the subgroup is to discuss and develop consensus recommendations on fundamental and largely philosophical issues related to long-term safety principles and criteria for radioactive waste disposal.

23014 (ORNL/TM–12297) **Liquid and Gaseous Waste Operations Department annual operating report, CY 1992.** Gillespie, M.A.; Maddox, J.J.; Scott, C.B. Oak Ridge National Lab., TN (United States). Mar 1993. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013459. Source: OSTI; NTIS; INIS; GPO Dep.

A total of 6.05 x 10^7 gal of liquid waste was decontaminated by the Process Waste Treatment Plant (PWTP) ion exchange system during CY 1992. This averaged to 115 gpm throughout the year. When necessary, a wastewater sidestream of 50–80 gpm was treated through the use of a natural zeolite treatment system. An additional 8.00 x 10^6 gal (average of 15 gpm throughout the year) were treated by the zeolite system. Therefore, the average total flow treated at the PWTP for CY 1992 was 130 gpm. In mid-June, the zeolite system was repiped to allow it the capability to treat the ion exchange system's discharge due to rising Cs problems in the wastewater. While being used to treat the ion exchange system's discharge, it cannot treat a sidestream of wastewater. During the year, the regeneration of the cation exchange resins resulted in the generation of 7.83 x 10^3 gal of liquid low-level waste (LLLW) concentrate and 1.15 x 10^4 gal of LLLW evaporator feed. The head-end softening process (precipitation/clarification) generated 604 drums (4.40 x 10^3 ft^3) of solid low-level waste sludge. The zeolite treatment system generated approximately 8.40 x 10^2 ft^3 of spent zeolite resin, which was turned over to the Solid Waste Operations Department for disposal. See Table 1 for a monthly summary of activities at the PWTP. Figures 1, 2, 3, and 4 show a comparison of operations at the PWTP in 1992 with previous years. Figure 5 shows a comparison of annual rainfall at Oak Ridge National Laboratory (ORNL) since 1987. A total of 1.55 x 10^8 gal of liquid waste (average of 294 gpm throughout the year) was treated at the Nonradiological Wastewater Treatment Plant (NRWTP). Of this amount, 1.40 x 10^7 gal were treated by the precipitation/clarification process for removal of heavy metals. Twenty-five boxes (1.60 x 10^3 ft^3) of solid sludge generated by the precipitation/clarification process were removed from the filter press room.

23015 (PNL–8492) **Leach testing of in situ stabilization grouts containing additives to sequester contaminants.** Serne, R.J. (Pacific Northwest Lab., Richland, WA (United States)); Ames, L.L.; Martin, P.F.C.; LeGore, V.L.; Lindenmeier, C.W.; Phillips, S.J. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012861. Source: OSTI; NTIS; INIS; GPO Dep.

This document discusses laboratory testing performed by Pacific Northwest Laboratory (PNL) for Westinghouse Hanford Company (WHC) of special grout formulations that incorporate specific sequestering agents to help improve the ability of the cement to resist contaminant leaching. To enhance the sequestering of contaminants we chose five additives to introduce (singly) to the control cement. The additives were Florida pebble phosphate, clinoptilolite (a natural zeolite), ferrous sulfide (a reductant), a mixed bed organic ion exchange resin and a proprietary anion-adsorbing mixed metal oxide. These additives were added one per test to the standard formulation and used to encapsulate a diluted high-salt alkaline liquid waste that is produced after various processes to remove uranium and plutonium from spent nuclear fuel. This report documents the testing of these additives.

23016 (PNL–8502) **First-order study of property/composition relationships for Hanford Waste Vitrification Plant glasses.** Piepel, G.F.; Hrma, P.R.; Bates, S.O.; Schweiger, M.J.; Smith, D.E. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93007931. Source: OSTI; NTIS; INIS; GPO Dep.

A first-order composition variability study (CVS-I) was conducted for the Hanford Waste Vitrification Plant (HWVP) program to preliminarily characterize the effects on key glass properties of variations i selected glass (waste and frit) components. The components selected were SiO_2,B_2O_3,Al_2O_3, Fe_2O_3, ZrO_2, Na_2O,Li_2O,CaO,MgO, and Others (all remaining waste components). A glass composition region was selected for study based on the expected range of glass compositions and the results of a previous series of scoping and solubility studies. Then, a 23-glass statistically-designed mixture experiment was conducted and data obtained for viscosity, electrical conductivity, glass transition temperature, thermal expansion, crystallinity, and durability [Materials Characterization Center (MCC-1) 28-day leach test and the 7-day Product Consistency Test (PCT)]. These data were modeled using first-order functions of composition, and the models were used to investigate the effects of the components on glass and melt properties. The CVS-I data and models will also be used to support the second-order composition variability study (CVS-II).

23017 (PNL–8618) **106-AN grout pilot-scale test HGTP-93-0501-02.** Bagaasen, L.M. Pacific Northwest Lab., Richland, WA (United States). May 1993. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013110. Source: OSTI; NTIS; INIS; GPO Dep.

The Grout Treatment Facility (GTF) at Hanford, Washington will process the low-level fraction of selected double-shell tank (DST) wastes into a cementitious waste form. This facility, which is operated by Westinghouse Hanford Company (WHC), mixes liquid waste with cementitious materials to produce a waste form that immobilizes hazardous constituents through chemical reactions and/or microencapsulation. Over 1,000,000 gal of Phosphate/Sulfate Waste were solidified in the first production campaign with this facility. The next tank scheduled for treatment is 106-AN. After conducting laboratory studies to select the grout formulation, part of the normal formulation verification process is to conduct tests using the 1/4-scale pilot facilities at the Pacific Northwest Laboratory (PNL). The major objectives of these pilot-scale tests were to determine if the proposed grout formulation could be processed in the pilot-scale equipment and to collect thermal information to help determine the best way to manage the grout hydration heat.

23018 (PNL-SA–20281) **A methodology to predict the uniformity of double-shell waste slurries based on mixer pump operation.** Liljegren, L.M.; Bamberger, J.A. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 17p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920808–15: American Institute of Chemical Engineers (AIChE) summer national meeting, Minneapolis, MN (United States), 9-12 Aug 1992). Order Number DE93007866. Source: OSTI; NTIS; INIS; GPO Dep.

Dimensional analysis is used to determine the similarity parameters that describe the uniformity of radioactive slurry wastes to be suspended by mixer pumps. The results of this analysis are applied to the design of scaled experiments that will determine the operating parameters that will ensure an adequately uniform feed stream during waste retrieval from Hanford double-shell tanks. Ten dimensionless parameters describing the slurry mixing process were identified. Of these, three describe purely geometric features, three describe slurry properties only, one is a dimensionless time scale, and three describe important dynamic factors. The three parameters describing the dynamic features are the Reynolds number, which describes the degree of turbulence in the tank; the Froude number, which describes the effects of stratification on the circulation patterns; and the gravitational settling number, which describes the balance between the work done by gravity to cause settling and the work done by the pump to resuspend particles.

23019 (PNL-SA–20592) **Performance assessment for low-level radioactive waste management and disposal at DOE facilities: Requirements, review process, and lessons learned.** Neuder, S.M. (Pacific Northwest Lab., Washington, DC (United States)); Wilhite, E.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920466–17: Engineering and technology conference on waste management and environmental restoration, San Juan (Puerto Rico), 9-11 Apr 1992). Order Number DE93008258. Source: OSTI; NTIS; INIS; GPO Dep.

Department of Energy (DOE) facilities, located at sites across the nation, generate large quantities and a wide variety of low-level radioactive waste (LLRW) from nuclear defense production and research and development activities. All DOE-generated LLRW is disposed of at DOE disposal sites. Most DOE waste generating sites do not have disposal facilities on site and so must ship their LLRW to one of six currently active DOE disposal locations. Four disposal sites are located in generally arid regions: the Hanford Reservation (HANF) in the state of Washington, the Nevada Test Site (NTS), the Idaho National Engineering Laboratory (INEL), and the Los Alamos National Laboratory (LANL) in New Mexico. The other two disposal sites are located in the humid southeast: The Savannah River Plant (SRP) in South Carolina and the Oak Ridge National Laboratory (ORNL) in Tennessee.

23020 (PNL-SA–20802) **DOE mixed wastes: What are they and where can thermal technologies be applied?.** Ross, W.A. (Pacific Northwest Lab., Richland, WA (United States)); Borduin, L.C.; Musgrave, B.C. Pacific Northwest Lab., Richland, WA (United States). May 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920527–11: 1992 incineration conference, Albuquerque, NM (United States), 11-14 May 1992). Order Number DE93008259. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Treatment Project (MWTP) has collected and analyzed mixed low-level waste data to assist in developing treatment capability for the US Department of Energy is (DOE) wastes. Initial data on the characteristics of mixed waste was obtained from the Waste Management Information System (WMIS) data base, and has been updated based on visits to DOE sites where most of the wastes are generated and stored. The streams of interest to the MWTP have a current inventory of about 70,000 m^3 and a generation rate of about 7,700 m^3/yr. The 12 sites with the most significant processing needs are Fernald, Hanford, K-25 (Oak Ridge), Idaho National Engineering Laboratory (INEL), Lawrence Livermore National Laboratory (LLNL), Los Alamos National Laboratory (LANL), Oak Ridge National Laboratory (ORNL), Paducah Gaseous Diffusion Plant, Portsmouth Gaseous Diffusion Plant, Rocky Flats Plant (RFP), Savannah River Site (SRS), and Y-12 (Oak Ridge). These 12 sites account for about 98% of the mixed waste volumes. The wastes have been assigned to specific waste characterization categories and a flowsheet that identifies applicable technologies has been developed. The largest waste stream category, when considering the current inventory in storage, is inorganic solids, with sludges, filter cakes, and residues the largest specific subcategories. Aqueous liquids are the largest currently generated stream. The other large categories are solid organics, metals wastes, and heterogenous wastes. Organic liquids, which have been a major focus, are the smallest of the categories. The major thermal treatment units include evaporators, incinerators, vitrifiers, metal melters, and off-gas treatment systems.

23021 (PNL-SA–21258) **Non-fuel bearing hardware melting technology.** Newman, D.F. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930408–68: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93013162. Source: OSTI; NTIS; INIS; GPO Dep.

Several utilities have decided to consolidate spent fuel rods in order to increase the storage capacity of their reactor pools cost-effectively. Fuel rod compaction of 2:1 has been achieved through disassembly of spent fuel and placing all the rods from two assemblies into a canister that will fit in a single assembly's rack space. The non-fuel bearing hardware (NFBH) left over from the disassembly still occupies about 1/3 of the volume of the consolidated fuel after compaction. This report discusses melting of NFBH which, in conjunction with rod consolidation of spent fuel assemblies can increase spent fuel.storage capacity more than 30% beyond that possible with underwater low-pressure compaction of this hardware.

23022 (PNL-SA–21393) **High-level waste management and treatment program for The Analytical Laboratory.** King, A.G.; Baldwin, D.L.; Steele, R.T.; Poston, K.A. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–37: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009340. Source: OSTI; NTIS; INIS; GPO Dep.

A new program has been successfully implemented for the treatment, storage, and disposal of high-level radioactive mixed wastes generated during chemical and radiological analysis at the Pacific Northwest Laboratory in Richland, Washington. This shielded laboratory facility has effectively treated RCRA waste generated predominantly from analyses of radioactive samples obtained during the Tank Waste Characterization Program on the Hanford Site. Several batches of the radioactive mixed waste, generated during the full analytical characterization of four Hanford Single Shell Tank cores and the partial characterization of three other cores, were combined and successfully treated during January through August of 1992. The waste treatment process was specifically designed to treat a low-pH, high-chloride, high-gamma activity waste stream. The creation of the treatment, storage and disposal facility required an extensive six-month permit modification process resulting in state and federal regulatory approval.

23023 (PNL-SA–21394) **Low-level radioactive waste from nuclear power generating stations: Characterization, classification and assessment of activated metals and waste streams.** Thomas, V.W.; Robertson, D.E.; Thomas, C.W. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 9p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–38: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009339. Source: OSTI; NTIS; INIS; GPO Dep.

Since the enactment of 10 CFR Part 61, additional difficult-to-measure long-lived radionuclides, not specified in Tables 1 2 of Part 61, have been identified (e.g., ^{108m}Ag, ^{93}Mo, ^{36}Cl, ^{10}Be, ^{113m}Cd, ^{121m}Sn, ^{126}Sn, ^{93m}Nb) that may be of concern in certain types of waste. These nuclides are primarily associated with activated metal and perhaps other nuclear power low-level waste (LLW) being sent to disposal facilities. The concentration of a radionuclide in waste materials is normally determined by direct measurement or by indirect calculational methods, such as using a

scaling factor to relate inferred concentration of a difficult-to-measure radionuclide to another that is easily measured. The total disposal site inventory of certain difficult-to-measure radionuclides (e.g., ^{14}C, ^{129}I, and ^{99}Tc) often control the total quantities of radioactive waste permitted in LLW burial facilities. Overly conservative scaling factors based on lower limits of detection (LLD), often used in the nuclear power industry to estimate these controlling nuclides, could lead to premature closure of a disposal facility. Samples of LLW (Class B and C activated metals [AM] and other waste streams) are being collected from operating nuclear power stations and analyzed for radionuclides covered in 10 CFR Part 61 and the additional difficult-to-measure radionuclides. This analysis will enhance the NRC's understanding of the distribution and projected quantities of radionuclides within AM and LLW streams from commercial nuclear power stations. This research will also provide radiological characterization of AM specimens for others to use in leach-rate and lysimeter experiments to determine nuclide releases and subsequent movement in natural soil environments.

23024 (PNL-SA–21453) **Quantitative measurement of cyanide species in simulated ferrocyanide Hanford waste.** Bryan, S.A.; Pool, K.H.; Matheson, J.D. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–33: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009479. Source: OSTI; NTIS; INIS; GPO Dep.

Analytical methods for the quantification of cyanide species in Hanford simulated high-level radioactive waste were pursued in this work. Methods studied include infrared spectroscopy (solid state and solution), Raman spectroscopy, Moessbauer spectroscopy, X-ray diffraction, scanning electron microscopy-electron dispersive spectroscopy (SEM-EDS), and ion chromatography. Of these, infrared, Raman, X-ray diffraction, and ion chromatography techniques show promise in the concentration range of interest. Quantitation limits for these latter four techniques were demonstrated to be approximately 0.1 wt% (as cyanide) using simulated Hanford wastes.

23025 (PNL-SA–21459) **Best Available Technology (BAT) guidance for radiological liquid effluents at US Department of Energy Facilities.** Wallo, A. III (USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States)); Peterson, H.T. Jr.; Ikenberry, T.A.; Baker, R.E. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930130–12: 26. Health Physics Society midyear topical meeting on environmental health physics, Coeur d'Alene, ID (United States), 24-28 Jan 1993). Order Number DE93007886. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE), in DOE Order 5400.5 (1990), directs operators of DOE facilities to apply the Best Available Technology (BAT) to control radiological liquid effluents from these facilities when specific conditions are present. DOE has published interim guidance to assist facility operators in knowing when a BAT analysis is needed and how such an analysis should be performed and documented. The purpose of the guidance is to provide a uniform basis in determining BAT throughout DOE and to assist in evaluating BAT determinations during programmatic audits. The BAT analysis process involves characterizing the effluent source; identifying and selecting candidate control technologies; evaluating the potential environmental, operational, resource, and economic impacts of the control technologies; developing an evaluation matrix for comparing the technologies; selecting the BAT; and documenting the evaluation process. The BAT analysis process provides a basis for consistent evaluation of liquid effluent releases, yet allows an individual site or facility the flexibility to address site-specific issues or concerns in the most appropriate manner.

23026 (PNL-SA–21463) **Tank waste chemistry: A new understanding of waste aging.** Babad, H. (Westinghouse Hanford Co., Richland, WA (United States)); Camaioni, D.M.; Lilga, M.A.; Samuels, W.D.; Strachan, D.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–31: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009475. Source: OSTI; NTIS; INIS; GPO Dep.

There is concern about the risk of uncontrolled exothermic reactions(s) in Hanford Site waste tanks containing NO_{3minus}/NO_{2minus} based salts and/or metal hydroxide sludges in combination with organics or ferrocyanides. However, gradual oxidation of the waste in the tanks to less reactive species appears to have reduced the risk. In addition, wastes sampled to date contain sufficiently large quantities of water so that propagation reactions are highly unlikely. This report details an investigation into the risk of an uncontrolled exothermic reaction in Hanford Site high-activity water tanks.

23027 (PNL-SA–21559) **Waste glass melting stages.** Anderson, L.D.; Dennis, T.; Elliott, M.L.; Hrma, P. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930438–15: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93013166. Source: OSTI; NTIS; INIS; GPO Dep.

Three different simulated nuclear waste glass feeds, consisting of dried waste and glass frit, were heat treated for 1 hour in a gradient furnace at temperatures ranging from approximately 600°C–1000°C. Simulated melter feeds from the Hanford Waste Vitrification Plant (HWVP), the Defense Waste Processing Facility (DWPF), and Kernforschungszentrum Karlsruhe (KfK) in Germany were used. The samples were thin-sectioned and examined by optical microscopy to investigate the stages of the conversion from feed to glass. Various phenomena were seen, such as frit softening, bubble formation, foaming, bubble motion and removal, convective mixing, and homogenization. Behavior of different feeds was similar, although the degree of gas generation and melt homogenization varied.

23028 (PNL-SA–21856) **Results of vitrifying Fernald OU-4 wastes.** Merrill, R.A. (Pacific Northwest Lab., Richland, WA (United States)); Janke, D.S. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–50: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93010167. Source: OSTI; NTIS; INIS; GPO Dep.

Three silos in Operable Unit 4 (OU-4) at the Feed Materials Production Center in Fernald, Ohio, contain residues from the processing of pitchblende ores. Silos 1 and 2, designated as K-65, contain the depleted ore with a BentoGrout cap over the material to reduce radon emanation, while Silo 3 contains calcined residue from processing solutions. The residues in the three silos contain radium, uranium, uranium daughters, and heavy metals (primarily lead). Vitrification tests were carried out on various mixtures of the above materials and the resulting glasses were analyzed. The vitrified residues all tested "non-hazardous" by the Toxicity Characteristic Leachate Procedure (TCLP) and demonstrated a high degree of durability by the Product Consistency Test (PCT). The specific gravity and radon emanation of both the vitrified and non-vitrified residue were measured. Volume reductions ranging from 50 to 68 percent were obtained while the radon emanation rate was reduced by a factor of about 500,000. Radon emanation from the vitrified residue is of the same order of magnitude as emanation from natural building materials such as brick or concrete.

23029 (PNL-SA–21893) **Low temperature hydrothermal processing of organic contaminants in Hanford tank waste.** Jones, E.O. (Pacific Northwest Lab., Richland, WA (United States)); Pederson, L.R.; Freeman, H.D.; Schmidt, A.J.; Babad, H. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–46: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009815. Source: OSTI; NTIS; INIS; GPO Dep.

Batch and continuous flow reactor tests at Pacific Northwest Laboratory (PNL) have shown that organics similar to those present in the single-shell and double-shell underground storage tanks at Hanford can be decomposed in the liquid phase at relatively mild temperatures of 150°C to 350°C in an aqueous process known as hydrothermal processing (HTP). The organics will react with the abundant oxidants such s nitrite already present in the

Hanford tank waste to form hydrogen, carbon dioxide, methane, and ammonia. No air or oxygen needs to be added to the system. Ferrocyanides and free cyanide will hydrolyze at similar temperatures to produce formate and ammonia and may also react with nitrates or other oxides. During testing, the organic carbon was transformed first to oxalate at~310°C and completely oxidized to carbonate at ~350°C accompanied by hydroxide consumption. Solids were formed at higher temperatures, causing a small-diameter outlet tube to plug. The propensity for plugging was reduced by diluting the feed with concentrated hydroxide.

23030 (PNL-SA–22047) **Risk management in facility transition and management decision making: Needs and opportunities.** Stillwell, W. (Pacific Northwest Lab., Richland, WA (United States)); Seaver, D.; Keller, J.; Smith, D.; Weaver, D.; Sanders, T.; Thullen, P. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–42: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009813. Source: OSTI; NTIS; INIS; GPO Dep.

An overall approach to risk management is described in this paper. Many of these concepts have been developed and applied as part of Hanford Mission Planning (HMP) (Hanford Mission Plan, 1992). At Hanford, HMP provides a mechanism for integrating planning across all the missions and programs of the site. This paper discusses the decision context within which EM must make and defend decisions, the types of decisions that are being and will need to be made in order to progress with the cleanup of the DOE complex, and the resulting need for risk management. Risk management, in turn, requires quality health and ecological risk information to make these decisions. Other types of information are also needed, but the risk information is typically the most important and the most difficult to obtain. The paper then describes a general technical approach to risk management, including particular methods for developing the high quality of human health and ecological risk information that will be needed to support risk management. We next turn to several special issues that make risk management more complex than many other decisions. We discuss these issues and offer some practical suggestions with respect to addressing them in the risk management framework. Finally, we conclude with some discussion of other opportunities for applying risk management.

23031 (PNL-SA–22264) **AREST: The next generation.** Engel, D.W. (Pacific Northwest Lab., Richland, WA (United States)); McGrail, B.P.; Eslinger, P.W.; Altenhofen, M.K. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930408–70: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93013165. Source: OSTI; NTIS; INIS; GPO Dep.

Simple mass transport models using constant boundary conditions at the waste form surface and at the host rock boundary do not always result in realistic predictions of the performance of an underground repository for the disposal of high-level radioactive waste. What is needed is a model that couples the important processes that can not be modeled independently, including (1) thermal modeling, (2) geochemical modeling, (3) containment degradation, (4) waste form dissolution, and (5) radionuclide transport. Such a model is being developed by modifying the AREST code.

23032 (POEF/ER/Sub–88/4551/D1-Vol.1) **Quadrant III RFI draft report: Volume 1.** Portsmouth Gaseous Diffusion Plant, OH (United States); Geraghty and Miller, Inc., Dublin, OH (United States). Environmental Services. Dec 1992. 531p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00001. Order Number DE93007778. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the RCRA Facility Investigation (RFI) at The Portsmouth Gaseous Diffusion Plant (PORTS) is to acquire, analyze and interpret data that will: characterize the environmental setting, including ground water, surface water and sediment, soil and air; define and characterize sources of contamination; characterize the vertical and horizontal extent and degree of contamination of the environment; assess the risk to human health and the environment resulting from possible exposure to contaminants; and support the Corrective Measures Study (CMS), which will follow the RFI, if required. A total of 18 Solid Waste Management Units (SWMU's) were investigated. All surficial soil samples (0–2 ft), sediment samples and surface-water samples proposed in the approved Quadrant III RFI Work Plan were collected as specified in the approved work plan and RFI Sampling Plan. All soil, sediment and surface-water samples were analyzed for parameters specified from the Target Compound List and Target Analyte List (TCL/TAL) as listed in the US EPA Statement of Work for Inorganic (7/88a) and Organic (2/88b) analyses for Soil and Sediment, and analyses for fluoride, Freon-113 and radiological parameters (total uranium, gross alpha, gross beta and technetium).

23033 (PTE–1) **Research and development work on radioactive waste management and underground burial of chemical-toxic wastes - first half of 1991.** Kernforschungszentrum Karlsruhe GmbH (Germany). Projekttraegerschaft Entsorgung. Dec 1991. 112p. (In German). Order Number DE93792711. Source: OSTI; NTIS (US Sales Only); INIS.

The progress report documents the intermediate and final results of the work on decommissioning of nuclear installations and ultimate disposal of hazardous wastes. The subjects dealt with are, in particular, concept, planning, assurance of due concentration, normal operational and post-operational phases, and accident control and limitation of consequences during operational and post-operational phases. A list of the research institutions involved is attached. (orig.).

23034 (RFP–4611) **Low-level waste sorting of small packages.** Wishard, B.E. (EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant); Harlan, R.A.; Anderson, B.P.; Peterson, K.; Caldwell, J.T. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9305180–1: FG&G cadet conference, Idaho Falls, ID (United States), 13-14 May 1993). Order Number DE93012702. Source: OSTI; NTIS; INIS; GPO Dep.

An active neutron interrogation system utilizing the differential die-away technique (DDT), was built to assay fissile material in small waste packages for a variety of matrices. Within minutes the system can make a "go/no-go" decision for sorting low-level waste (LLW) from transuranic waste (TRUW). It can also provide gram-level accountability of weapons-grade (WG) Pu in TRUW providing lumps of self-shielding fissile material are absent.

23035 (SAND–91-2733) **Investigations of deteriorated concrete from the liner of the Waste Isolation Pilot Plant Waste Shaft.** Nowak, E.J. (Sandia National Labs., Albuquerque, NM (United States)); Wakeley, L.D.; Poole, T.S.; Burkes, J.P. Sandia National Labs., Albuquerque, NM (United States). Jun 1992. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93011475. Source: OSTI; NTIS; INIS; GPO Dep.

During inspections of the Waste Isolation Pilot Plant Waste Shaft in May 1990, patchy areas of apparently degraded concrete were observed on the inner surface of the shaft liner between approximately 810 feet and 900 feet below the surface. The apparent cause of this degradation is chemical reaction of the concrete with magnesium-bearing brine in the annulus between the concrete liner and the host rock. The greater thickness of the degraded layer below the joint may be related to the different chemical compositions that were determined by analyses of the paste portions of concrete samples from above and below the joint. The analytical results support a complex mechanistic explanation of concrete degradation observed behind the liner and in the joint: chemical weakening of the concrete paste; cracking by precipitation of solids in pores; and increased permeability due to calcium chloroaluminate formation. Additional sampling, analyses, and regular monitoring are worth considering to bound the vertical extent of Waste Shaft liner degradation, detect concrete liner degradation in other shafts, and measure any ongoing degradation that may be occurring.

23036 (SAND–92-1148) **The use of formal and informal expert judgments when interpreting data for performance assessments.** Rechard, R.P. (Sandia National Labs., Albuquerque, NM (United States)); Trauth, K.M.; Tierney, M.S.; Rath, J.S.; Guzowski, R.V.; Hora, S.C. Sandia National Labs., Albuquerque, NM (United States). Feb 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012394. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the general process by which data and information are compiled and used for defining modeling parameters. These modeling parameters are input for the mathematical models that are used in performance assessments of the Waste Isolation Pilot Plant (WIPP), near Carlsbad, NM, which is designed to safely manage, store, and dispose of transuranic radioactive wastes. The physical and temporal scales, and the difficulty of obtaining measurements in geologic media make interpretation of measured data, including the difference between laboratory experiment scale and repository scale, important tasks. In most instances, standard scientific practices can ensure consistency of data use. To illustrate this point, an example is provided of the interpretation of field measurements of intrinsic permeability for use in computational models using the bootstrap technique. In some cases, sufficient information can never be collected, interpretation of the information is controversial, or information from diverse disciplines must be used. A procedure that formalizes the standard scientific practices under these conditions has been developed. An example is provided of how this procedure has been applied in eliciting expert judgments on markers to deter inadvertant human intrusion into the WIPP.

23037 (SAND–92-1537C) **Three-dimensional finite element simulation of creep deformation in rock salt.** Weatherby, J.R.; Munson, D.E.; Argueello, J.G. Sandia National Labs., Albuquerque, NM (United States). [1992]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930889–1: 2. U.S. National Congress on Computational Mechanics meeting, Washington, DC (United States), 16-18 Aug 1993). Order Number DE93011595. Source: OSTI; NTIS; INIS; GPO Dep.

A multi-mechanism deformation (M-D) constitutive model for rock salt has been implemented in a finite element code for use in three-dimensional, finite strain simulations of creep closure in deeply-buried salt excavations. Essential details of the numerical implementation are presented. The constitutive model is exercised in a three-dimensional closure simulation of a large underground field experiment. Finally, results from the simulation are compared against actual closure measurements taken from the experiment.

23038 (SAND–92-1934C) **Updated recommendations for low-level waste performance assessment.** Kozak, M.W.; Olague, N.E. Sandia National Labs., Albuquerque, NM (United States). [1993]. 9p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930396–11: Waste management '93, Tucson, AZ (United States), 1-5 Mar 1993). Order Number DE93011599. Source: OSTI; NTIS; INIS; GPO Dep.

A low-level radioactive waste performance assessment methodology was developed by Sandia National Laboratories for use by the US Nuclear Regulatory Commission in evaluating license applications under 10 CFR Part 61. The purpose of the methodology is to allow confirmation of a licensee's evaluation of postclosure impacts, to provide reasonable assurance that the performance objectives in 10 CFR Part 61.41 are met. Subsequent work has been undertaken to update and improve the methodology where necessary, and to build confidence in the models in the methodology. Since developing the methodology, it has been applied several times to test cases. This additional experience allows an improved assessment of the modeling needs. This paper assesses the adequacy of the current models, and identifies additional models that may be useful to include in the methodology. Models that have become available since the preparation of the original methodology are discussed. In addition, a formal process for low-level waste performance assessment and treatment of uncertainty is recommended, and model validation is examined.

23039 (SAND–92-2285) **Conceptual structure of performance assessments conducted for the Waste Isolation Pilot Plant.** Helton, J.C. (Arizona State Univ., Tempe, AZ (United States)); Marietta, M.G.; Rechard, R.P. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013948. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) in southeastern New Mexico is being developed by the US Department of Energy as a disposal facility for transuranic waste. In support of this project, Sandia National Laboratories is conducting an ongoing performance assessment (PA) for the WIPP. The ordered triple representation for risk proposed by Kaplan and Garrick is used to provide a clear conceptual structure for this PA. This presentation describes how the preceding representation provides a basis in the WIPP PA for (1) the definition of scenarios and the calculation of scenario probabilities and consequences, (2) the separation of subjective and stochastic uncertainties, (3) the construction of the complementary cumulative distribution functions required in comparisons with the US Environmental Protection Agency's standard for the geologic disposal of radioactive waste (i.e., 40 CFR Part 191, Subpart B), and (4) the performance of uncertainty and sensitivity studies. Results obtained in a preliminary PA for the WIPP completed in December of 1991 are used for illustration.

23040 (SAND–92-2660C) **Details of in situ sample retrievals and test completion for the Materials Interface Interactions Test (MIIT).** Molecke, M.A. (Sandia National Labs., Albuquerque, NM (United States)); Wicks, G.G. Sandia National Labs., Albuquerque, NM (United States); Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789 ;AC09-76SR00001. (CONF-930438–11: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012350. Source: OSTI; NTIS; INIS; GPO Dep.

The Materials Interface Interaction Tests (MIIT) program involves the comparative, performance-evaluation testing of multiple US and foreign nuclear waste glasses (nonradioactive), potential canister and overpack metals, brine, and geologic materials in the rock salt repository environment at the Waste Isolation Pilot Plant (WIPP) facility. We emplaced about 2000 materials specimens onto 50 test assemblies and exposed them to a 90 $\pm$ 10°C salt-brine environment. We successfully concluded the in situ conduct of the MIIT after five years and retrieved all samples for posttest laboratory analyses. These 5-year glass and metal samples, along with samples previously retrieved after 0.5, 1, and 2 years, are being analyzed in multiple international laboratories, in a cooperative testing effort. Our focus in this paper is to summarize technical details and repository-relevant observations on the in situ conduct, sampling, and termination operations of the MIIT. Such information should be useful for the interpretation of the laboratory-based analyses and also relevant for other organizations planning or conducting similar materials-related, in situ tests.

23041 (SAND–92-2670C) **Investigation of fracture-matrix interaction: Preliminary experiments in a simple system.** Foltz, S.D. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Physics and Astronomy); Tidwell, V.C.; Glass, R.J.; Sobolik, S.R. Sandia National Labs., Albuquerque, NM (United States). [1992]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930408–65: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93011580. Source: OSTI; NTIS; INIS; GPO Dep.

Paramount to the modeling of unsaturated flow and transport through fractured porous media is a clear understanding of the processes controlling fracture-matrix interaction. As a first step toward such an understanding, two preliminary experiments have been performed to investigate the influence of matrix imbibition on water percolation through unsaturated fractures in the plane normal to the fracture. Test systems consisted of thin slabs of either tuff or an analog material cut by a single vertical fracture into which a constant fluid flux was introduced. Transient moisture content and solute concentration fields were imaged by means of x-ray absorption. Flow fields associated with the two different media were

significantly different owing to differences in material properties relative to the imposed flux. Richards' equation was found to be a valid means of modeling the imbibition of water into the tuff matrix from a saturated fracture for the current experiment.

23042 (SAND–92-2679C) **A concept to combine DOE waste minimization goals with commercial utility needs for a universal container system for spent nuclear fuel storage, transportation, and disposal.** Falci, F.P. (USDOE, Washington, DC (United States)); Sorenson, K.B.; Smith, M.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930408–60: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93009855. Source: OSTI; NTIS; INIS; GPO Dep.

Two major initiatives are underway in the US that are creating a significant financial impact on both the US taxpayer and on users of electric power. First, the US Department of Energy (DOE) has been tasked with cleaning-up the defense complex. This task is managed under the direction of the Office of Environmental Restoration and Waste Management (EM) of the DOE. The waste that EM must address includes radioactive, hazardous, and mixed that consists of both radioactive and hazardous constituents. Second, the DOE is required by the Nuclear Waste Policy Act (NWPA) to take title to commercial nuclear spent fuel assemblies starting in 1998. The DOE Office of Civilian Radioactive Waste Management (OCRWM) was established to carry out this charter. Since a final repository is not scheduled for opening until 2010 at the earliest, the DOE is planning on providing a Monitored Retrievable Storage (MRS) facility for centralized storage to bridge the time gap between 1998 and 2010. The NWPA requires that nuclear utilities pay a fee into a specific fund that Congress uses to pay the DOE for the development of the MRS, the transportation system, and the repository. This fund, along with the EM budget, constitutes a multi-billion dollar effort to manage DOE nuclear waste and to store and dispose of commercial spent nuclear fuel. These two seemingly unrelated problems have aspects of commonality that can be considered for the benefit of both programs, the US taxpayer, and the utility rate payer. Both programs are the responsibility of the DOE, and both will require engineered packages for storage, transportation, and disposal of the EM waste and commercial spent fuel. Rather than using specialized systems for each step (storage, transport, and disposal), a concept for a Universal Container System has been developed that could potentially simplify the overall waste management system, reduce expensive handling operations, and reduce total system cost.

23043 (SAND–92-7072) **Waste Isolation Pilot Plant Salado hydrology program data report No. 2.** Stensrud, W.A. (INTERA, Inc., Austin, TX (United States)); Dale, T.F.; Domski, P.S.; Palmer, J.B.; Roberts, R.M.; Fort, M.D.; Saulnier, G.J. Jr.; Jensen, A.L. Sandia National Labs., Albuquerque, NM (United States). Dec 1992. 477p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012398. Source: OSTI; NTIS; INIS; GPO Dep.

WIPP Salado Hydrology Program Data Report #2 presents hydrologic data collected during permeability testing of the Salado Formation performed from August 1989 through July 1992. The report presents the results of the drilling and testing of six boreholes drilled from the WIPP underground facility 655 m below ground surface in the Salado Formation. Permeability tests were conducted using multipacker test tools with inflatable packers to isolate borehole intervals to allow formation pore-pressure buildup and subsequent pressure-pulse and constant-pressure-withdrawal tests. The tests performed in boreholes L4P51, L4P52, SCP01, S1P71, S1P72, an S1P73 involved Marker Beds 138 and 139, anhydrites "a," "b," and "c," clays B, D, E, G, H, J, and K, and several halitic strata. Test data include pressure and temperature from the brine-filled, packer- isolated test intervals, fluid and gas production during constant- pressure-withdrawal tests, and borehole-closure and axial test tool- movement measurements. The boreholes were drilled and/or cored to nominal 10.2-cm diameters using compressed air to remove drill cuttings. Compliance tests were conducted in lengths of steel and stainless-steel casing to evaluate the mechanical performance of the multipacker test tools. Compliance tests included leak tests and pulse-injection and pulse-withdrawal sequences. Following permeability testing, fluid pressures were monitored in packer- isolated sections of test boreholes C2H01, C2H02, SCP01, SIP71, SIP72, DPD01, DPD02, and DPD03.

23044 (SAND–92-7306) **A modeling approach to address spatial variability within the Culebra Dolomite transmissivity field.** LaVenue, A.M. (INTERA, Inc., Albuquerque, NM (United States)); RamaRao, B.S. Sandia National Labs., Albuquerque, NM (United States); INTERA, Inc., Albuquerque, NM (United States); INTERA, Inc., Austin, TX (United States). Dec 1992. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012395. Source: OSTI; NTIS; INIS; GPO Dep.

Spatial estimates of transmissivity, which are essential input to a groundwater flow model, are usually developed from a limited number of transmissivity measurements and therefore associated with an uncertainty. In an attempt to assess the spatial variability of the unmeasured transmissivities within the Culebra Dolomite near the Waste Isolation Pilot Plant (WIPP), a multiple realization approach is employed. An innovative aspect of the methodology is the generation of an ensemble of conditional simulations of the transmissivity field, which preserves the statistical moments and spatial correlation structure of the measured transmissivity field and horrors the measured values at their locations. Each simulation is then calibrated, using an iterative procedure, to match an exhaustive set of steady-state and transient pressure data. A completely automated inverse algorithm using pilot points as parameters of calibration was employed. The methodology was applied to the transmissivity fields for the Culebra Dolomite aquifer, and 70 conditional simulations were produced and calibrated. Based on an analysis of the calibrated transmissivity fields, additional data in a region east and north of the H-3 borehole would help to more accurately characterize the transmissivity of the region and reduce the uncertainty in calculating groundwater travel times. Progress in these areas would, in, turn, reduce the uncertainty in the prediction of concentrations at the accessible environment boundary.

23045 (UCRL-CR–109772) **Chemical health risk assessment for hazardous and mixed waste management units at Lawrence Livermore National Laboratory: Volume 1.** Lawrence Livermore National Lab., CA (United States); Radian Corp., Sacramento, CA (United States). Sep 1992. 204p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009574. Source: OSTI; NTIS; INIS; GPO Dep.

The Lawrence Livermore National Laboratory (LLNL) operates three Hazardous Waste Management Facilities with 24 associated waste management units for the treatment and storage of hazardous and mixed wastes. These wastes are generated by research programs and support operations. The storage and treatment units are presently operated under interim status in accordance with the requirements of the US Envirorunental Protection Agency (US EPA) and the Department of Toxic Substances Control (DTSC), a division of the California Envirorunental Protection Agency (Cal/EPA). As required by the California Hazardous Waste Control Act and the Resource Conservation and Recovery Act (RCRA), LLNL ha s applied for a Part B permit to continue operating the storage and waste treatment facilities. As part of this permitting process, LLNL is required to conduct a health risk assessment (HRA) to examine the potential health impacts to the surrounding community from continued storage and treatment of hazardous and mixed wastes. analysis document presents the results of this risk assessment. An analysis of maximum credible chemical accidents is also included in Section 7.0. This HRA was prepared in accordance with procedures set forth by the California Air Pollution Control Officers Association (CAPCOA) "Air Toxics Assessment Manual," CAPCOA guidelines for preparing risk assessments under the Air Toxic "Hot Spots" Act (AB 2588) and requirements of the US EPA. By following these procedures, this risk assessment presents a conservative analysis of a hypothetical Maximally Exposed Individual (MEI) using many worst-case assumptions that will not apply to an actual individual. As such, the

risk estimates presented should be regarded as a worst-case estimate of any actual risk that may be present.

23046 (UCRL-CR–112802-Vol.1) **Construction quality assurance closure report, Lawrence Livermore National Laboratory Site 300, Pits 1 and 7: Volume 1, Text, tables, figures, and appendices A–D.** Lawrence Livermore National Lab., CA (United States); Golder Associates, Inc., Alameda, CA (United States). Feb 1993. 555p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009575. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the Final Construction Quality Assurance (CQA) report for the closure cover system of two mixed, low-level radioactive and hazardous waste landfills (pits) at Site 300. Site 300, operated by the Lawrence Livermore National Laboratory (LLNL), is located in the Altamont Hills, approximately 15 miles southeast of Livermore, California. The purpose of this report is to document the CQA program established to assure that construction is completed in accordance with the design intent and the approved Closure and Post Closure Plans dated May 1989 and revised January 1990 (EPA ID Number: CA 2890090002). Inclusive within the Closure and Post Closure Plan were the CQA Plan and the Technical Specifications for the final cover system. This report contains a complete narrative with photographic documentation of the construction activities and progress, problems encountered and solutions utilized, and third party testing and monitoring results, thus establishing the verification of compliance with the Quality Assurance Plan for the project.

23047 (UCRL-CR–112802-Vol.2) **Construction quality assurance closure report, Lawrence Livermore National Laboratory Site 300, Pits 1 and 7: Volume 2, Appendices E–P.** Lawrence Livermore National Lab., CA (United States); Golder Associates, Inc., Alameda, CA (United States). Feb 1993. 606p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009576. Source: OSTI; NTIS; GPO Dep.

This document presents the Final Construction Quality Assurance (CQA) report for the closure cover system of two mixed, low-level radioactive and hazardous waste landfills (pits) at Site 300. Site 300, operated by the Lawrence Livermore National Laboratory (LLNL), is located in the Altamont Hills, approximately 15 miles southeast of Livermore, California. The purpose of this report is to document the CQA program established to assure that construction is completed in accordance with the design intent and the approved Closure and Post Closure Plans dated May 1989 and revised January 1990 (EPA ID Number: CA 2890090002). Inclusive within the Closure and Post Closure Plan were the CQA Plan and the Technical Specifications for the final cover system. This document consists of Appendices E through P and contains information and drawings related to the cover system.

23048 (UCRL-ID–108067) **Closure report for Building 875 sump encased in concrete.** Montemayor, W. Lawrence Livermore National Lab., CA (United States). Aug 1991. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009446. Source: OSTI; NTIS; INIS; GPO Dep.

This report will document the post-closure activities for the 875-R1U1 Waste-Solvent Underground Storage Tank located at Lawrence Livermore National Laboratory (LLNL), Site 300. The aforementioned tank waspreviously identified and registered with the California Water Resources Control Board as 875-31R. The underground tank system consists of a 55-gallon steel drum encased in concrete. The underground tank was used to collect dripping and spillage from the above-concrete drum rack storage area. The closure of this underground tank was permitted as Tank Identification No. 39-1945-21 by W.R. Snavely of SJCPHS-EHS. The last tank test, performed on February 1988, showed that the underground tank was leak tight. On May 1988, the sludge at the bottom of the tank was removed and disposed of as hazardous waste. The residual 1.5 inches of oily water in the tank was removed and the tank was washed with soap and water on December 11, 1989. The rinsate and residual sludge was disposed of as hazardous waste. The empty tank and the encasing concrete were extracted from the ground on November 5, 1990. No underground piping was associated with the removal of this underground tank since the tank was used to collect the dripping and spillage from the above-concrete drum rack. Three soil samples were collected in split tubes from approximately 1 foot below the bottom of the tank. The soil samples were collected and analyzed for Total Petroleum Hydrocarbon (TPH)-Gasoline, TPH-Diesel, Total Extractable Petroleum, Benzene, Toluene, Xylene, Ethyl Benzene, Tetraethyl Lead, Metals, Polychlorinated Biphenyls (PCB), and Ethylene Dibromide. Results indicated that the underground tank was leak tight. The concrete encasing was removed from the 55-gallon tank and disposed of as a municipal waste. The 55-gallon tank is currently stored at the Hazardous Waste Storage Area located in Lawrence Livermore National Laboratory, Livermore, California and is waiting as a hazardous waste.

23049 (UCRL-ID–113718) **Study of plutonium volatility under microwave melting conditions used for glass encapsulation of plutonium sludge wastes: Final report.** Krikorian, O.H.; Condit, R.H.; Fontes, A.S. Jr.; Morris, W.F.; Magana, J.W.; Lougheed, R.W. Lawrence Livermore National Lab., CA (United States). 20 Apr 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014367. Source: OSTI; NTIS; GPO Dep.

Transpiration measurements have been made to evaluate the extent of Pu volatilities expected during microwave melting of Pu sludge/glass mixtures. Measurements have been made at 2% PuO_2 and 0.03% PuO_2 in Pu sludge/glass mixtures, where Pu is found to volatilize as $PuO_2(OH)_2(g)$ at pressures of the order of 10^{-10} to 10^{-11} atm at melt temperatures of ~1400 K. The data are extrapolated to the actual expected conditions of Pu contents of 0.0003% in the Pu sludge/glass mix, at a melt temperature of 1500 K, O_2 pressure of 0.2 atm, and H_2O pressure 0.1 atm. The pressure of $PuO_2(OH)_2(g)$ is estimated to be 8×10^{-14} atm under these conditions. An estimate is also given of $AmO_2(OH)_2(g)$ volatility of 4×10^{-17} atm when ^{241}Am is present at a level of 500 ppM in the Pu.

23050 (UCRL-JC–108815) **The dissolution rate of UO_2 in the alkaline regime under oxidizing conditions using a simplified ground water analog.** Leider, H.R.; Nguyen, S.N.; Weed, H.C.; Steward, S.A. Lawrence Livermore National Lab., CA (United States). Jan 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920430–104: 3. international high level radioactive waste management (IHLRWM) conference, Las Vegas, NV (United States), 12-16 Apr 1992). Order Number DE93009314. Source: OSTI; NTIS; INIS; GPO Dep.

The major factor controlling the long term release of radionuclides from spent fuel in a geologic repository is the leaching/dissolution by groundwater of the UO_2 matrix, since more than 90% of the radionuclide waste is contained in the fuel matrix. The objective of this investigation is to provide experimental dissolution rates for UO_2 samples which can be used to develop a mechanistic release model (or models) for UO_{2+x} ($x \geq 0$) under repository conditions. Several types of data will be obtained from this study: (1) the dissolution rates of UO_2 as a function of pI-L temperature, carbonate and oxygen fugacity; (2) the comparison of the steady state dissolution rates of "not-reduced" versus "reduced" UO_2 samples and of single crystal versus polycrystalline UO_2 under identical experimental conditions; (3) the pre- and post-test surface analyses of the samples to provide information on the surface phases that may be formed under experimental conditions.

23051 (UCRL-JC–109901) **Mixed Waste Treatment Project – Scope and status.** Coleman, J. (USDOE Environmental Restoration and Waste Management, Washington, DC (United States). Office of Waste Operations); Cowan, S.; Harmon, L.H.; Rhoderick, J.; Borduin, L.C.; Musgrave, B.C.; Ross, W.A. Lawrence Livermore National Lab., CA (United States). Mar 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920307–93: Waste management '92, Tucson, AZ (United States), 1-5 Mar 1992). Order Number DE93012492. Source: OSTI; NTIS; INIS; GPO Dep.

Department of Energy (DOE) facilities currently store and generate significant quantities of mixed wastes - mixtures of materials containing both radioactive and hazardous chemical contamination.

These wastes must be managed in compliance with DOE requirements and EPA Land Disposal Restrictions. To help meet these requirements for low-level mixed wastes, the DOE Office of Waste Operations has established The Mixed Waste Treatment Project (MWTP). The overall goal of the MWTP is demonstration of effective treatment of low-level mixed wastes in a full-scale prototype plant. The MWTP staff, supported by a technical committee comprised of waste operations representatives from Hanford, Idaho, Los Alamos, Oak Ridge, Rocky Flats and Savannah River have reviewed the three major DOE data bases, the Integrated Data Base, the National Report on Prohibited Wastes and the Waste Management Information System data base managed by HAZWRAP. Database upgrades to meet MWTP needs are being pursued by field visits to the major mixed waste generators. A reference flowsheet was developed for treatment of low level contact handled mixed wastes. Technology gaps identified by these analyses are being used by DOE Waste Operations, and the Office of Technology Development to define technology development needs. A brief analysis of options for deployment of capabilities to treat mixed wastes at DOE facilities nationwide has been conducted.

23052 (UCRL-JC–110079) **Closure of Building 624 incinerator.** Ridley, M.N.; Hallisey, M.L.; Terusaki, S.; Steverson, M. Lawrence Livermore National Lab., CA (United States). Jun 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920527–15: 1992 incineration conference, Albuquerque, NM (United States), 11-14 May 1992). Order Number DE93013199. Source: OSTI; NTIS; GPO Dep.

The Building 624 incinerator was a Resource Conservation Recovery Act (RCRA) mixed waste incinerator at Lawrence Livermore National Laboratory (LLNL). This incinerator was in operation from 1978 to 1989. The incinerator was to be closed as a mixed waste incinerator, but was to continue burning classified nonhazardous solid waste. The decision was later made to discontinue all use of the incinerator. Closure activities were performed from June 15 to December 15, 1991, when a clean closure was completed. The main part of the closure was the characterization, which included 393 samples and 30 blanks. From these 393 samples, approximately 13 samples indicated the need for further investigation, such as an isotopic scan; however, none of the samples was concluded to be hazardous or radioactive.

23053 (UCRL-JC–110826) **Experimental A&PCT research and development efforts to characterize mixed-waste forms.** Martz, H.E.; Roberson, G.P.; Robert-Coutant, C.; Camp, D.C. Lawrence Livermore National Lab., CA (United States). 15 Dec 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920882–3: Transuranic waste characterization conference, Pocatello, ID (United States), 10-12 Aug 1992). Order Number DE93007510. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization of mixed wastes requires that the identity and strengths of intrinsic radioactive sources be determined accurately and that all hazardous materials be identified. We have a three-phased R&D effort to address the nondestructive assay (NDA) of 208-L canisters. These phases are (1) experimental active (A) and passive (P) computed tomography (CT) R&D, (2) simulated A&PCT R&D, and (3) determination of minimum-detectable limits vs waste-matrix attenuation. We report here on the experimental effort; reports on the other two efforts are also published in these proceedings. Experimental data were acquired on a small-scale canister containing mock wastes and two passive sources (95-μCi ^{133}Ba and 74-μCi ^{228}Th) using a CT scanner built in-house. These data are used to investigate the use of (1) ACT to obtain images that represent cross-sectional attenuation maps of a wastecanister's contents; (2) PCT to locate and determine the identity of any radioisotopic sources present; and (3) ACT data to correct the PCT data so that accurate source strengths can be determined. Multiple, monoenergetic ACT images, which yield effective atomic number data, were used to investigate whether hazardous materials could be identified by means of their effective atomic numbers.

23054 (UCRL-JC–110827) **Simulated A&PCT data to study the mixed waste forms characterization problem.** Robert-Coutant, C.; Martz, H.E.; Azevedo, S.G. Lawrence Livermore National Lab., CA (United States). 30 Nov 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920882–4: Transuranic waste characterization conference, Pocatello, ID (United States), 10-12 Aug 1992). Order Number DE93009282. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization of mixed wastes requires that the identity and strengths of all intrinsic radioactive sources be determined accurately and all hazardous materials identified. We have investigated the nondestructive evaluation/assay (NDE/NDA) of 208-L drums with active (A) and passive (P) computed tomography (CI) in three phases: (1) computer simulation, (2) experimental measurements, and (3) determination of minimum-detectable limits for various x-ray and gamma-ray attenuation properties typical of waste containers. We report here on the simulation effort; the other two are also presented elsewhere in these proceedings.1 The A&PCT process consists of mapping the activity of intrinsic sources using PCT data and correcting the data for attenuation by A matrix obtained from an ACT scan. Simulated data are necessary to better understand A&PCT reconstruction algorithms, measure their performance, and better interpret experimental data. The simulation program is based on a forward-projection algorithm to discretely compute the projections (i.e., integrated counts per unit time per unit area) of an emitting object attenuated by a user-specified matrix. We use two algebraic, iterative, A&PCT reconstruction codes: a weighted-least-squares, steepest-descent (WLS-SD) algorithm and a maximum-likelihood expectation-maximization (MLEM) algorithm. We present three simulated phantom studies: (1) a large homogeneous source included in a large homogeneous attenuator, (2) a mock-waste drum involving small sources, and (3) a spatial-resolution phantom. All examples involve attenuation but are not strong enough to cause missing data, and the last example includes noise. Simulated results are reported and analyzed in the context of mixed-waste characterization.

23055 (UCRL-JC–112397) **Waste salt recovery, recycle, and destruction.** Hickman, R.G. Lawrence Livermore National Lab., CA (United States). Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930160–13: 2. semi-annual Office of Technology Development (OTD) information meeting, Houston, TX (United States), 26-28 Jan 1993). Order Number DE93009289. Source: OSTI; NTIS; INIS; GPO Dep.

Starting in 1943 and continuing into the 1970s, radioactive wastes resulting from plutonium processing at Hanford were stored underground in 149 single shell tanks. Of these tanks, 66 are known or believedto be leaking, and over a period are believed to have leaked about 750,000 gal into the surrounding soil. The bulk of the aqueous solution has been removed and transferred to double shell tanks, none of which are leaking. The waste consists of 37 million gallons of salt cake and sludge. Most of the salt cake is sodium nitrate and other sodium salts. A substantial fraction of the sludge is sodium nitrate. Small amounts of the radionuclides are present in the sludge as oxides or hydroxides. In addition, some of the tanks contain organic compounds and ferrocyanide complexes, many of which have undergone radiolytic induced chemical changes during the years of storage. As part of the Hanford site remediation effort, the tank wastes must be removed, treated, and the residuals must be immobilized and disposed of in an environmentally acceptable manner. Removal methods of the waste from the tanks fall generally into three approaches: dry removal, slurry removal, and solution removed. The latter two methods are likely to result in some additional leakage to the surrounding soil, but that may be acceptable if the tank can be emptied and remediated before the leaked material permeates deeply into the soil. This effort includes three parts: salt splitting, acid separation, and destruction, with initial emphasis on salt splitting.

23056 (UCRL-LR–107476-Vol.2) **Preliminary near-field environment report: Volume 2, Scientific overview of near-field environment and phenomena.** Wilder, D.G. Lawrence Livermore National Lab., CA (United States). Apr 1993. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014855. Source: OSTI; NTIS; INIS; GPO Dep.

The Yucca Mountain Site Characterization Project Office (YMPO) of the Department of Energy's Office of Civilian Radioactive Waste

Management Program is conducting a broad range of studies to determine the suitability of Yucca Mountain, Nevada, as the site for a potential nuclear-waste repository. The potential repository horizon is in the unsaturated zone, well above the saturated rock units. The major advantages of unsaturated conditions are that container corrosion, waste-form leaching, and radionuclide transport mechanisms are minimized due to the lack of contact between liquid water and the waste package (WP). The design and performance of the WP and the engineered barrier system (EBS) will be dependent on the geomechanical, hydrologic, and geochemical conditions over time in the rock forming the near-field environment (NFE). Whereas the purpose of Vol. 1 of this report ("Technical Bases for EBS Design") is to provide technical information on the NFE that is needed for future repository design decisions, the purpose of this volume is to document the scientific and engineering data, models, and approaches that were used to gather that information, thus enabling scientists and engineers to determine the validity of the information provided in Vol. 1. This is of particular importance since there is only limited data and experience with these types of engineered systems, especially in unsaturated rock masses, and very little data or understanding of engineering system performance at the temperatures that will likely result from waste emplacement. It is important, therefore, to have an understanding of the physical processes (a mechanistic understanding) in addition to the statistical distributions of the environmental conditions. This volume consists of eight sections divided by area of study, and a final section summarizing the results of field tests performed at G-Tunnel at the Nevada Test Site (NTS) near Yucca Mountain.

23057 (USGS-OFR–92-572) **Assessment of geophysical logs from borehole USW G-2, Yucca Mountain, Nevada.** Nelson, P.H. (Geological Survey, Denver, CO (United States)); Schimschal, U. Geological Survey, Denver, CO (United States). 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE93013189. Source: OSTI; NTIS; INIS; GPO; U.S. Geological Survey, Books and Open File Reports Section, Federal Center, Box 25425, Denver, CO 80225; GPO Dep.

Commercial logging contractors, Western Atlas, Schlumberger, and Edcon obtained borehole geophysical logs at the site of a potential high level nuclear waste repository at Yucca Mountain, Nevada. Drill hole USW-G2 was picked for this test of suitable logging tools and logging technology, both representing state-of-the-art technology by these commercial companies. Experience gained by analysis of existing core data and a variety of logs obtained earlier by Birdwell and Dresser Atlas served as a guide to a choice of logs to be obtained. Logs were obtained in water-filled borehole in zeolitized tuff (saturated zone) and in air-filled borehole largely in unaltered welded tuff (unsaturated zone).

23058 (WHC-EP–0617-Draft) **Tank waste decision analysis report: Draft.** Johnson, M.E. (Westinghouse Hanford Co., Richland, WA (United States)); Grygiel, M.L.; Baynes, P.A.; Bekemeier, J.P.; Zimmerman, B.D.; Triplett, M.B. Westinghouse Hanford Co., Richland, WA (United States). 31 Mar 1993. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93011903. Source: OSTI; NTIS; INIS; GPO Dep.

The Assistant Secretary for Environmental Restoration and Waste Management and the director of the Washington State Department of Ecology agreed to the need to re-evaluate treatment and disposal plans for Hanford Site tank waste. Re-evaluation of the tank waste treatment and disposal plans (referred to as re-baselining) was necessary to (1) provide an integrated system approach for achieving safe storage, (2) resolve tank safety issues, and (3) treat and dispose of all Hanford Site tank waste. Re-baselining evaluated new approaches to remediate Hanford Site tank waste and, thus, reaffirm existing plans or recommend a new technical strategy. To facilitate this integrated system approach for managing the program elements, the US Department of Energy formed the Tank Waste Remediation System (TWRS). While conducting this re-evaluation, the US Department of Energy agreed to continue supporting the existing plan for treatment and disposal of Hanford Site tank waste. The selection of a proposed new technical strategy for the TWRS Program is a complex task involving the evaluation of a large body of data. The data that is available to support the selection of a proposed new technical strategy is based on engineering estimates and preliminary technology development. To accommodate this complex, dynamic situation, a systems engineering approach is being applied to structure and analyze technical strategies and to manage the TWRS Program. Systems engineering is a generalized and systematic methodology for defining problems, evaluating solutions, and implementing the solutions. This report describes the development of the TWRS Program systems engineering analysis, the analytical methodologies that support it, and the results of the analyses that were used to define the proposed new technical strategy.

23059 (WHC-SA–1544) **Hanford Waste Vitrification Project Building limited scope risk assessment.** Braun, D.J.; Lindberg, S.E.; Reardon, M.F.; Wilson, G.P. Westinghouse Hanford Co., Richland, WA (United States). Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930116–45: Probabilistic safety assessment international topical meeting (PSA 93), Clearwater Beach, FL (United States), 27-29 Jan 1993). Order Number DE93011357. Source: OSTI; NTIS; INIS; GPO Dep.

A limited scope risk assessment was performed on the preliminary design of a high-level waste interim storage facility. The Canister Storage Building (CSB) facility will be built to support remediation at the US Department of Energy Hanford Site in Washington State. The CSB will be part of the support facilities for a high level Hanford Waste Vitrification Plant (HWVP). The limited scope risk assessment is based on a preliminary design which uses forced air circulation systems to move air through the building vault. The current building design calls for natural circulation to move air through the building vault.

23060 (WHC-SA–1698) **Safety analysis and inventory control of transuranic and low-level waste in common storage.** Porten, D.R.; Bonner, A.L.; Joyce, J.P. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930204–2: '93 meeting on waste management, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93011282. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a methodology developed For the inventory control of low-level waste (LLW) and transuranic (TRU) waste, when both are stored in the same location, and both contribute to an inventory constrained by safety considerations. Development of the method arose from the necessity to make safety analysis calculations for the addition of LLW, in quantities greater than existing inventory limits would allow when stored with TRU waste, in the Hanford Central Waste Complex (CWC)-Ensuring that the dose consequences of credible releases are maintained at low-hazard limits or less, was used to allow greater than Type A quantities of LLW into the CWC. Basically, what happens is the original limited amount of TRU allowed is reduced by some equivalent amount of LLW introduced. The total quantity of TRU, and LLW in excess of Type A quantities, must be administratively maintained via curie equivalency Factors to ensure operation as a low-hazard Facility. The "equivalency" between TRU and LLW proposed here is specific only to the CWC, but the methodology can be used for other specific applications, such as TRU and LLW storage or handling facilities where inventory limits must be enforced or where a simplified inventory system is required.

23061 (WHC-SA–1723) **Computer simulation of the thermal history of a Hanford Site high heat load waste tank.** Bander, T.J. (Westinghouse Hanford Co., Richland, WA (United States)); McCall, T.B. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930395–4: Computer simulation in waste management and environmental sciences, Washington, DC (United States), 29 Mar - 1 apr 1993). Order Number DE93011354. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results of a transient thermal analysis based on historical records of a high heat load single-shell tank of radioactive waste from United States weapons material processes. The thermally related information includes the following: waste material additions and extractions, recorded levels of both liquid and

sludge layers, total heat load for the tank, based upon: water additions, psychrometric measurements, and isotopic chemical makeup of sampled wastes thermocouple data in the air space, liquid layer, and sludge layers. This information was analyzed and evaluated to construct an approximate heat source in the tank as a function of time. A thermal model was developed for each consistent geometric configuration of the waste with boundary conditions and thermal input. Reasonably conservative assumptions were used in all aspects of the modeling. The boundary conditions were always selected to cause higher-than-expected temperatures in the transient analyses. The temperature distribution is shown for the time when maximum temperatures occur in the models. Also, temperature histories are shown for selected nodes in the models.

23062 (WHC-SA–1731) **Hanford Waste Vitrification Plant project overview and status.** Smets, J.L. (Fluor Daniel, Inc., Irvine, CA (United States)); Swenson, L.D. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930408–63: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93011252. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Waste vitrification Plant (HWVP) is being constructed at the US Department of Energy's Hanford Site in Richland, Washington. Engineering and design are being accomplished by Fluor Daniel, Inc. in Irvine, California. Technical input is furnished by Westinghouse Hanford Company and construction management services by UE&C-Catalytic Inc.

23063 (WHC-SA–1733) **The Hanford Waste Vitrification Plant shielding design: A historical perspective.** Fortsch, M. (Fluor Daniel, Inc., Las Vegas, NV (United States)); Negin, C. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930408–64: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93011280. Source: OSTI; NTIS; INIS; GPO Dep.

The shielding design Of the Hanford Waste Vitrification Plant (HWVP) has been underway for many years and is continuing. During its progress, there have been improvements in various calculational methods that provided practical guidance to the overall design activities and established the shielding requirements for the facility. This paper demonstrates how these changing and improving methods were implemented. It also historically describes the development of the methods themselves.

23064 (WHC-SA–1738) **Mechanical design of the storage tubes in the Hanford Waste Vitrification Plant Canister Storage Building.** Janicek, G.P. (Westinghouse Hanford Co., Richland, WA (United States)); Mullally, J.A.; Divona, C.J.; Fages, R. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930408–66: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93011278. Source: OSTI; NTIS; INIS; GPO Dep.

High-level waste canisters from the Hanford Waste Vitrification Plant will be stored in an adjacent facility called the Canister Storage Building. The canisters are stored vertically in an array the tubes within the shielded vault area of the Canister Storage Building. The following discussion addresses the mechanical design of the storage tubes, the shield floor plugs that confine the waste within the tubes, the impact absorber system used to ensure that the canisters are not breached during an unintentional fall, and the installation and testing of components.

23065 (WHC-SA–1835) **Tank 241-CX-70 waste removal and packaging.** DuVon, D.K. Westinghouse Hanford Co., Richland, WA (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9304128–10: Department of Energy (DOE) radiation protection conference, Las Vegas, NV (United States), 13-15 Apr 1993). Order Number DE93014624. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-CX-70, located on the Hanford Site in Washington State, is a 30,000 gal single-shell storage tank built in 1952 to hold high-level process waste from pilot tests of the reduction-oxidation process. In 1979 decommissioning operations were begun by pumping liquid waste from the tank to the double-shell tank (DST) 101-AY. Not all the waste was removed at that time. Approximately 10,300 gal of sludge remained. On September 25, 1987, operations were resumed to remove the remaining waste using a sluicing and pumping method. This report documents the final removal of waste from Tank 241-CX-70.

23066 (WHC-SA–1921) **Summary of FY 1992 operations of the vapor extraction system at the Hanford Site, Washington.** Green, J.W.; Hand, R.L.; Johnson, W.L.; Millikin, E.J.; Rohay, V.J. Westinghouse Hanford Co., Richland, WA (United States). May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9304117–3: International waste management conference, San Juan (Puerto Rico), 28 Apr 1993). Order Number DE93013050. Source: OSTI; NTIS; INIS; GPO Dep.

The 200 West Area Carbon Tetrachloride Expedited Response Action is being conducted on the Hanford Site by the US Department of Energy at the direction of the US Environmental Protection Agency and the Washington State Department of Ecology. The Expedited Response Action was initiated based on concerns that carbon tetrachloride residing in soils beneath the 200 West Area from past disposal practices may be continuing to serve as a source for contamination of the groundwater. The method for removing the carbon tetrachloride includes utilization of soil vapor extraction from existing wells with above-ground collection of the carbon tetrachloride on granular activated carbon. The activated carbon is sent off-site for regeneration. This paper summarizes the operations and lessons learned for Fiscal Year 1992 and presents operational plans for FY 1993.

23067 (WHC-SP–0909) **Tri-party agreement milestone summary, September 1992.** Calapristi, F.T. Westinghouse Hanford Co., Richland, WA (United States). Sep 1992. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93011300. Source: OSTI; NTIS; INIS; GPO Dep.

Budgets and schedules pertaining to radioactive waste management at the Hanford Reservation are presented. Milestones, accomplishments and planned actions are included for treatment of tank shell waste, vitrification plant operations, remedial investigation studies for all operable units, closure plans, the WRAP facility, and other treatment facilities.

23068 (WHC-SP–1689) **Infrared imaging systems for the ferrocyanide waste tanks at the US Department of Energy's Hanford Site.** Mailhot, R.B.; Morris, K.L. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930204–3: '93 meeting on waste management, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93011285. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's Hanford Site in Washington State has 24 radioactive storage tanks containing ferrocyanide. There is a concern that these tanks could become explosive. Infrared imaging was investigated as a method to determine if high-heat areas (i.e., "hot spots") exist in the tanks. A hot spot is defined as a volumetric region within a waste tank with an excessively warm [220°C (428°F)] temperature that is generated by radioactive isotopes. The thermal image of a hot spot was modeled by computer. This model determined the temperature variation an infrared system must detect. Laboratory and field tests of the imaging system are described and conclusions based on the laboratory data are presented. The report describes the system's capabilities and limitations. The infrared imaging system is able to detect the surface image of the modeled hot spot in most of the ferrocyanide tanks.

23069 (WSRC-MS–91-104-Rev.1) **The Product Composition Control System at Savannah River: The statistical process control algorithm: Revision 1.** Brown, K.G. Westinghouse

Savannah River Co., Aiken, SC (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930608–1-Rev.1: Safewaste '93: the final disposal of nuclear waste, Avignon (France), 14-18 Jun 1993). Order Number DE93011774. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Waste Processing Facility (DWPF) at the Savannah River Site (SRS) in Aiken, South Carolina, will be used to immobilize the approximately 130 million liters of high-level nuclear waste currently stored at the site in 51 carbon steel tanks. Waste handling operations separate this waste into highly radioactive insoluble sludge and precipitate and less radioactive water soluble salts. (In a separate facility, the soluble salts are disposed of as low-level waste in a mixture of cement, slag, and flyash.) In DWPF, precipitate (PHA) is blended with insoluble sludge and ground glass tit to produce melter feed slurry which is continuously fed to the DWPF melter. The melter produces a molten borosilicate glass which is poured into stainless steel canisters for cooling and, ultimately, shipment to and storage in a geologic repository. The repository requires that the glass wasteform be resistant to leaching by underground water that might contact it. In addition, there are processing constraints on melt viscosity, liquidus temperature, and waste solubility.

23070 (WSRC-MS–92-430) **Application of probabilistic risk assessment methods to incinerator design and permitting.** Brown, E.A. (Westinghouse Savannah River Co., Aiken, SC (United States)); McAfee, D.E.; Aabye, D.C. Westinghouse Savannah River Co., Aiken, SC (United States). 14 Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930572–2: 12. annual international symposium on thermal treatment technologies - incineration conference, Knoxville, TN (United States), 3-7 May 1993). Order Number DE93012140. Source: OSTI; NTIS; GPO Dep.

The Consolidated Incineration Facility at the Savannah River Site is designed without emergency flue gas vents. The main components of this 18 million btu/hr facility are a rotary kiln and secondary combustion chamber, each with a code allowable internal pressure of 15 psig. The facility is designed to treat mixed waste. During the early stages of design it was judged on a qualitative basis that potential eventsthat might produce damaging overpressures were not credible. When these findings were questioned during subsequent design reviews, a probabilistic risk assessment was undertaken to provide a quantitative basis for decision making. The result was identification of design conditions leading to relatively high frequencies for a few event sequences in which the allowable pressure might be exceeded. Risk assessment assumptions and results were reviewed with design engineers and relatively simple improvements were identified that collectively reduced the frequency of overpressure to an acceptable level. This experience showed that the use of formalized risk assessment techniques can provide valuable insight leading to timely and cost-effective improvements in facility design and operating procedures. In this case, the program of analysis and follow-on improvements provided justification for incinerator operation without thermal relief devices.

23071 (WSRC-MS–92-505) **Effects of temperature and radiation on the nuclear waste glass product consistency leach test.** Crawford, C.L.; Bibler, N.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930438–5: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93011776. Source: OSTI; NTIS; INIS; GPO Dep.

Previous leach studies carried out with monolithic glass samples have shown that glass dissolution rates increase with increasing temperature and may or may not increase on exposure to external gamma radiolysis. In this study we have investigated the effects of temperature (70–1200°C) and radiation on the dissolution of simulated radioactive waste glasses using the Product Consistency Test (PCT). The PCT is a seven day, crushed glass leach test in deionized water that is carried out at 9OO°C. To date our results indicate no significant effect of external Co–60 gamma radiation when testing various simulated waste glasses at 90°C in a wellinsulated compartment within a Gammacell 220 irradiation unit. The temperature dependence for glass dissolution clearly exhibits Arrheniustype behavior for two of the three glasses tested. For the third glass the dissolution decreases at the higher temperatures, probably due to saturation effects. Actual radioactive waste glasses will be investigated later as part of this study.

23072 (WSRC-MS–93-143) **Code requirements for concrete repository and processing facilities.** Hookham, C.J. (Black & Veatch, Ann Arbor, MI (United States)); Palaniswamy, R. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930408–62: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93010380. Source: OSTI; NTIS; INIS; GPO Dep.

The design and construction of facilities and structures for the processing and safe long-term storage of low- and high-level radioactive wastes will likely employ structural concrete. This concrete will be used for many purposes including structural support, shielding, and environmental protection. At the present time, there are no design costs, standards or guidelines for repositories, waste containers, or processing facilities. Recently, the design and construction guidelines contained in American Concrete Institute (ACI), Code Requirements for Nuclear Safety Related Concrete Structures (ACI 349), have been cited for low-level waste (LLW) repositories. Conceptual design of various high-level (HLW) repository surface structures have also cited the ACI 349 Code. However, the present Code was developed for nuclear power generating facilities and its application to radioactive waste repositories was not intended. For low and medium level radioactive wastes, concrete has a greater role and use in processing facilities, engineered barriers, and repository structures. Because of varied uses and performance/safety requirements this review of the current ACI 349 Code document was required to accommodate these special classes of structures.

23073 (WSRC-MS–93-204) **Simulation of radionuclides in the saturated zone at the E-Area low- level radioactive waste disposal facility, Savannah River Site.** Hiergesell, R.A. (Westinghouse Savannah River Co., Aiken, SC (United States)); Kearl, P.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9306158–3: 1993 groundwater modeling conference, Boulder, CO (United States), 6-12 Jun 1993). Order Number DE93013684. Source: OSTI; NTIS; INIS; GPO Dep.

Numerical simulation of migration of Technetium-99 and Tritium beneath a proposed low-level radioactive waste disposal facility at the Savannah River Site was conducted utilizing the Porflow code. These species were selected for preliminary analysis based upon screening exercises designed to identify species of concern and because each has contrasting properties in regard to adsorption and half-life. Numerous field data describing the three-layered aquifer system were utilized to set up the model and for comparison to simulated results to achieve calibration. Results of initial simulations indicate that contaminants migrate laterally toward discharge zones at local streams. Vertically the Technetium-99 plume reached the lowermost aquifer in one small area in the vicinity of the surface water discharge zone. Maximum simulated radionuclide concentrations were reached at different times and locations but were both below levels that would pose a health threat to either the general public or inadvertent intruders.

23074 (WSRC-MS–93-207) **Treatment of mixed F006 contaminated material to meet the new EPA debris rule at the Savannah River Site.** Pickett, J.B.; Diener, G.A.; Carroll, S.J.; Steingard, J.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930873–13: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93013828. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Savannah River Company (WSRC), as the operating contractor for the Department of Energy (DOE) at the Savannah River Site (SRS) has demonstrated a procedure to clean mixed (radioactive/hazardous) materials to meet the criteria in the recently promulgated Land Disposal Restrictions "debris" rule. The

material was equipment (steel piping, transfer pumps valves) which had been used in industrial wastewater treatment facility to transfer listed F006 wastewater treatment plating line sludges to a RCRA storage tank complex. When the equipment needed to be replaced/repaired, it was concluded that the resulting debris would have to be managed as a mixed waste, due to the fact that the solid waste "contained" the listed hazardous waste.

23075 (WSRC-MS–93-217) **Regulatory issues in vitrification research: A case study of circuit board reclamation.** Bickford, D.F. (Westinghouse Savannah River Co., Aiken, SC (United States)); Compton, K.L.; Bennert, D.M. Westinghouse Savannah River Co., Aiken, SC (United States); Clemson Univ., SC (United States). Dept. of Environmental Systems Engineering. [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930438–17: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012796. Source: OSTI; NTIS; INIS; GPO Dep.

Vitrification has shown great potential as a method of remediation, as it incorporates aspects of all of the fundamental treatment techniques of destruction, extraction, and immobilization. A wide variety of waste streams can be treated to levels acceptable for disposal in municipal solid waste landfills. However, it is important that an individual considering vitrification as a treatment method understands the regulatory mechanism whereby a vitrified waste may be disposed of in a Subtitle D (i.e. non-hazardous) land disposal facility. This presentation is designed to orient the individual to the current RCRA requirements for land disposal of vitrified waste residues.

23076 (WSRC-RP–89-261) **Combustibility of tetraphenylborate solids.** Walker, D.D. Westinghouse Savannah River Co., Aiken, SC (United States). 3 May 1989. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013577. Source: OSTI; NTIS; INIS; GPO Dep.

Liquid slurries expected under normal in-tank processing (ITP) operations are not ignitible because of their high water content. However, deposits of dry solids from the slurries are combustible and produce dense, black smoke when burned. The dry solids burn similarly to Styrofoam and more easily than sawdust. It is the opinion of fire hazard experts that a benzene vapor deflagration could ignite the dry solids. A tetraphenylborate solids fire will rapidly plug the waste tank HEPA ventilation filters due to the nature of the smoke produced. To prevent ignition and combustion of these solids, the waste tanks have been equipped with a nitrogen inerting system.

23077 (WSRC-RP–90-359-Rev.1) **Canister disposition plan for the DWPF Startup Test Program: Revision 1.** Harbour, J.R.; Payne, C.H. Westinghouse Savannah River Co., Aiken, SC (United States). [1990]. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012822. Source: OSTI; NTIS; INIS; GPO Dep.

This report details the disposition of canisters and the canistered waste forms produced during the DWPF Startup Test Program. The six melter campaigns (DWPF Startup Tests FA-13, WP-14, WP-15, WP-16, WP-17, and FA-18) will produce 126 canistered waste forms. In addition, up to 20 additional canistered waste forms may be produced from glass poured during the transition between campaigns. In particular, this canister disposition plan (1) assigns (by alpha-numeric code) a specific canister to each location in the six campaign sequences, (2) describes the method of access for glass sampling on each canistered waste form, (3) describes the nature of the specific tests which will be carried out, (4) details which tests will be carried out on each canistered waste form, (5) provides the sequence of these tests for each canistered waste form, and (6) assigns a storage location for each canistered waste form. The tests are designed to provide evidence, as detailed in the Waste Form Compliance Plan (WCP[1]), that the DWPF product will comply with the Waste Acceptance Product Specifications (WAPS[2]). The WAPS must be met before the canistered waste form is accepted by DOE for ultimate disposal at the Federal Repository. The results of these tests will be included in the Waste Form Qualification Report (WQR).

23078 (WSRC-RP–90-522) **Backpulse and filter feed velocity effects on Norton filter performance.** Siler, J.L. Westinghouse Savannah River Co., Aiken, SC (United States). 8 May 1990. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93011785. Source: OSTI; NTIS; INIS; GPO Dep.

A series of tests have been conducted using the 2.2 ft^2 Norton filter to solve the fouling problems observed with the ETF Norton system. The objective of these tests was to determine filter efficiency as a function of backpulse strength and feed velocity. Based on experimental results, it is recommend that the filters should be operated at the following conditions: (1) Backpulse Transmembrane Pressure/FeedTransmembrane Pressure (BP/FP) > 1.5, preferably 2 or 3. (2) Feed crossflow velocity = 6–8 f/s. It is expected that operation at these conditions should improve performance by 30–60%.

23079 (WSRC-RP–93-227) **Lead macro-encapsulation conceptual and experimental studies: Final report.** Orebaugh, E.G. Westinghouse Savannah River Co., Aiken, SC (United States). 31 Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012137. Source: OSTI; NTIS; INIS; GPO Dep.

Macro-encapsulation, the regulatory treatment for radioactively contaminated lead (mixed) waste has been conceptually and experimentally evaluated for practical application. Epoxy encapsulants molded around lead billets have proven to be exceptionally rugged, easily applied, have high radiation and chemical stability, and minimize required process equipment and production of secondary wastes. This technology can now be considered developed, and can be applied as discussed in this report.

23080 (WSRC-RP–93-381) **Code-to-code benchmarking of SPEEDUP™ versus WATFAM.** Gregory, M.V. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013579. Source: OSTI; NTIS; GPO Dep.

SPEEDUP™ is a state-of-the-art, dynamic, chemical process modeling package offered by Aspen Technology. In anticipation of new customers needs for new analytical tools to support the site's waste management activities, SRTC has secured a multiple-user license to SPEEDUP™. In order to verify the modeling constructs in SPEEDUP™, identical representations of the 2H Evaporator system were set up in SPEEDUP™ and the current tank farm model WATFAM. These calculations augment earlier work on numerical benchmarking in establishing an on-site quality assurance pedigree for Speedup™. The dynamic response of the 2H Evaporator system (comprising of the evaporator itself, the evaporator feed Tank 43, the concentrate receipt Tank 38, the supernate recycle between Tanks 38 and 43, and the evaporator overhead) was tracked through a typical 50 day scenario. The initial and boundary conditions for both the SPEEDUP™ and WATFAM representations were defined identically. The recycle control algorithms were defined very differently for the two models, as required by the two different language constructs, SPEEDUP™ versus FORTRAN. During those intervals of time when the recycle dynamics in the two models could be constrained consistently (i.e., during the initial 40 days), the responses of the two codes were in excellent agreement. This constitutes a validation of the modeling constructs in SPEEDUP™ versus WATFAM, and vice versa.

23081 (WSRC-TR–92-121-Rev.1) **Projected radionuclide inventories of DWPF glass from current waste at time of production: Revision 1.** Plodinec, M.J. Westinghouse Savannah River Co., Aiken, SC (United States). 4 Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013573. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Acceptance Preliminary Specifications (WAPS) require that the DWPF estimate the inventory of long-lived radionuclides present in the waste glass, and report the values in the Waste Form Qualification Report. In this report, conservative (biased high) estimates of the radionuclide inventory of glass produced from waste currently in the Tank Farm are provided. In most cases, these calculated values compare favorably with actual data.

In those cases where the agreement is not good, the values reported here are conservative.

23082 (WSRC-TR–92-569) **Lot No. 1 of Frit 202 for DWPF cold runs.** Schumacher, R.F. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Apr 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013571. Source: OSTI; NTIS; INIS; GPO Dep.

This report was prepared at the end of 1992 and summarizes the evaluation of the first lot sample of DWPF Frit 202 from Cataphote Inc. Publication of this report was delayed until the results from the carbon analyses could be included. To avoid confusion the frit specifications presented in this report were those available at the end of 1992. The specifications were slightly modified early in 1993. The frit was received and evaluated for moisture, particle size distribution, organic-inorganic carbon and chemical composition. Moisture content and particle size distribution were determined on a representative sample at SRTC. These properties were within the DWPF specifications for Frit 202. A representative sample was submitted to Corning Engineering Laboratory Services for chemical analyses. The sample was split and two dissolutions prepared. Each dissolution was analyzed on two separate days. The results indicate that there is a high probability (>95%) that the silica content of this frit is below the specification limit of 77.0 ± 1.0 wt %. The average of the four analyzed values was 75.1 wt % with a standard deviation of 0.28 wt %. All other oxides were within the elliptical two sigma limits. Control standard frit samples were submitted and analyzed at the same time and the results were very similar to previous analyses of these materials.

23083 (WSRC-TR–93-010) **Canyon building ventilation system dynamic model – Parameters and validation.** Moncrief, B.R. (Westinghouse Savannah River Co., Aiken, SC (United States)); Chen, F.F.K. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930862–1: 1993 American Society of Mechanical Engineers (ASME) international computers in engineering conference and exposition, San Diego, CA (United States), 8-12 Aug 1993). Order Number DE93007633. Source: OSTI; NTIS; GPO Dep.

Plant system simulation crosses many disciplines. At the core is the mimic of key components in the form of mathematical "models." These component models are functionally integrated to represent the plant. With today's low cost high capacity computers, the whole plant can be truly and effectively reproduced in a computer model. Dynamic simulation has its roots in "single loop" design, which is still a common objective in the employment of simulation. The other common objectives are the ability to preview plant operation, to anticipate problem areas, and to test the impact of design options. As plant system complexity increases and our ability to simulate the entire plant grows, the objective to optimize plant system design becomes practical. This shift in objectives from problem avoidance to total optimization by far offers the most rewarding potential. Even a small reduction in bulk materials and space can sufficiently justify the application of this technology. Furthermore, to realize an optimal plant starts from a tight and disciplined design. We believe the assurance required to execute such a design strategy can partly be derived from a plant model. This paper reports on the application of a dynamic model to evaluate the capacity of an existing production plant ventilation system. This study met the practical objectives of capacity evaluation under present and future conditions, and under normal and accidental situations. More importantly, the description of this application, in its methods and its utility, aims to validate the technology of dynamic simulation in the environment of plant system design and safe operation.

23084 (WSRC-TR–93-078) **Investigation of the corrosion behavior of cooling coil material in a simulated concrete environment.** Wiersma, B.J. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Feb 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012821. Source: OSTI; NTIS; INIS; GPO Dep.

Pitting corrosion of the cooling coils embedded in the concrete roof of the waste tanks is one of the suspected causes of the recent cooling coil failures. Cyclic polarization tests were conducted to predict the threshold chloride level above which pitting would initiate. The threshold chloride level was determined to be 9000 ppM. Although these tests predict the electrochemical or corrosion behavior of the metal, they may not predict the severity of attack. Further tests which investigate the effect of the permeability of the concrete matrix on the transport of water and oxygen to the metal surface are planned to assess the severity of attack.

23085 (WSRC-TR–93-172) **662-E solid waste silo-plug lifting analysis.** Mertz, G.E. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (SRT-EMT–93-1035). Order Number DE93014728. Source: OSTI; NTIS; INIS; GPO Dep.

The Intermediate Level Tritium Vault No. 1, 662-E, Cell No. 1 contains 140 waste silos. Each silo is approximately 25 feet deep, 30 inches in diameter at the top and covered by a reinforced concrete plug. Two No. 4 reinforcing bars project from the top of each plug for lifting. During lifting operations, the 1.5 inch concrete cover over the lifting bars spelled off 16% of the silo plugs. The No. 4 reinforcing bars were also distorted on many of the silo plugs. Thirteen of the plugs have been repaired to date. The existing silo plug lifting bars have a safe working load of 480 pounds per plug, which is less than 1/3 of the dead weight of the silo plug. The safe working load was calculated using the minimum design factor of 3 based on the yield strength or 5 based on the ultimate strength of the material, as per the Savannah River Site Hoisting and Rigging Manual. The existing design calculations were reviewed, and the following items are noted: (1) Adequate concrete cover was not provided over the horizontal portion of the lifting bars. (2) The lifting bars were allowed to yield in bending, which violates the requirements of the Savannah River Site Hoisting and Rigging Manual. (3) The ultimate strain of the lifting bars would be exceeded before the calculated ultimate strength was achieved. Alternative lifting devices are also identified.

Discussions between Russian scientists from Arzamas-16 and Chelyabinsk-70 and a delegation of US scientists from the three weapons labs, SNL, LANL, and LLNL, were held over four days. The discussion sessions focused on various technical areas within the broad topic of environmental protection. Specific topics included: data acquisition from air, water, and soil sampling; field and laboratory analysis methods; remote sensing techniques and instrumentation; data base creation and use; public health investigations; mathematical modeling of contamination transport; and remediation technologies. Several sessions focused on a better understanding of the problems in the Chelyabinsk region created by the Russian nuclear weapons production and the current efforts to develop technology to deal with the problems. As a result of this interchange, 24 topics were identified that could be pursued iii cooperative efforts. Of these 24 topics, 12 were identified as having sufficient mutual interest that proposals to the International Science and Technology Center should be developed. Working together in smaller groups, one-page summary proposals were developed for the 12 topics. These proposals identified a lead contact for both the Russian and US groups, who will pursue further developmental efforts.

23087 (INIS-mf–13518) **The mining town of Pribram in science and technology. Abstracts of contributions.** 1992. [76p.] (In Czech). (CONF-9210351–: The mining town of Pribram in science and technology, Pribram (Czechoslovakia), 12-14 Oct 1992). Order Number DE93625342. Source: OSTI; NTIS (US Sales Only); INIS.

The publication contains 125 abstracts of contributions presented at the conference, out of which 16 have been inputted in INIS. These primarily deal with uranium mining problems, although topics such as the irradiation of crystals, economic problems of coal mining, and spent fuel storage in the Slovak Republic are also included. Uranium ore is mined in the Czech Republic at various sites, using conventional mining as well as extraction by leaching. The environmental impacts of such activities and their contribution to population exposure are discussed. Attention is also paid to the future land reclamation at tailing dumping grounds. (M.D.).

23091 (ORNL–6623) **Radiological survey results for the Peek Street site properties, Schenectady, New York.** Foley, R.D.; Cottrell, W.D.; Carrier, R.F. Oak Ridge National Lab., TN (United States). Aug 1992. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93008239. Source: OSTI; NTIS; INIS; GPO Dep.

The Peek Street Industrial Facility, located at 425 Peek Street, Schenectady, New York, was operated by the General Electric Company for the Atomic Energy Commission (AEC) between 1947 and 1955. A variety of operations using radioactive materials were conducted at the site, but the main activities were to design an intermediate breeder reactor and to develop a chemical process for the recovery of uranium and plutonium from spent reactor fuel. Nonradioactive beryllium metal was machined on the site for breeder reactor application. The 4.5-acre site was decommissioned and released in October 1955. A radiological survey was conducted by Oak Ridge National Laboratory in November 1989. The survey included scan and grid point measurements of direct radiation levels outdoors on the five properties and inside the factory building, and radionuclide analysis of samples collected from each property. Radionuclide concentrations were determined in outdoor surface and subsurface soil samples from each property and in dust, debris, and structural materials from inside the factory building. Auger holes were logged to assess location and extent of possible subsurface residual soil radioactivity. Radionuclide concentrations were deter-mined in both indoor and outdoor water samples and in selected samples of vegetation. The presence of fixed and transferable surface residual radioactivity was investigated inside the factory building and on discarded materials outdoors on the property. High-volume air samples as well as additional selected indoor and outdoor soil samples were analyzed to determine levels of elemental beryllium.

23092 (ORNL/M–2563) **Biological Monitoring and Abatement Program for the Oak Ridge K-25 Site.** Kszos, L.A. (Oak Ridge K-25 Site, TN (United States)); Adams, S.M.; Ashwood, T.L.; Blaylock, B.G.; Greeley, M.S.; Loar, J.M.; Peterson, M.J.; Ryon, M.G.; Smith, J.G.; Southworth, G.R.; Shoemaker, B.A.; Hinzman, R.L. Oak Ridge K-25 Site, TN (United States). Feb 1993. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. (K/EM–24/R1). Order Number DE93008487. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division, Oak Ridge National Laboratory Publication No. 4009.

A proposed Biological Monitoring and Abatement Program (BMAP) for the Oak Ridge K-25 Site was prepared in December 1992 as required by the renewed National Pollutant Discharge Elimination System permit that was issued on October 1, 1992. The proposed BMAP consists of four tasks that reflect different but complementary approaches to evaluating the effects of K-25 Site effluents on the ecological integrity of Mitchell Branch, Poplar Creek, and the Poplar Creek embayment of the Clinch River. These tasks include (1) ambient toxicity monitoring, (2) bioaccumulation monitoring, (3) assessment of fish health, and (4) instream monitoring of biological communities. This overall BMAP plan combines established protocols with current biological monitoring techniques to assess environmental compliance and quantify ecological recovery. The BMAP will also determine whether the effluent limits established for the K-25 Site protect the designated use of the receiving streams (Mitchell Branch, Poplar Creek, and Clinch River) for growth and propagation of fish and other aquatic life. Results obtained from this biological monitoring program will also be used to document the ecological effects (and effectiveness) of remedial actions.

23093 (PNL–8531) **Columbia River monitoring: Distribution of tritium in Columbia River water at the Richland Pumphouse.** Dirkes, R.L. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93011019. Source: OSTI; NTIS; GPO Dep.

The Surface Environmental Surveillance Project (SESP) is conducted by the Pacific Northwest Laboratory (PNL) for the US Department of Energy (DOE). This report presents the results of a special study conducted as part of the SESP to supplement the routine Columbia River monitoring program and provide information relative to the dispersion and distribution of Hanford origin contaminants entering the river through the seepage of ground water along the Hanford Site. Sampling was conducted along cross sections to determine the distribution of tritium within the Columbia River at Richland, Washington. The investigation was also designed to evaluate the relationship between the average tritium concentrations in the river water at this location and in water collected from the routine SESP river monitoring system located at the city of Richland drinking water intake (Richland Pumphouse). This study was conducted during the summers of 1987 and 1988. Water samples were collected along cross sections located at or near the Richland Pumphouse monitoring station.

23094 (ANL/EAIS/TM–79) **Modeling groundwater flow at the chemical plant area of the Weldon Spring Site.** Durham, L.A. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Oct 1992. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93009610. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater flow in the shallow unconfined aquifer at the chemical plant area of the Weldon Spring site, St. Charles County, Missouri, was modeled with the Coupled Fluid, Energy, and Solute Transport (CFEST) groundwater flow and contaminant transport computer code. The modeling was performed in support of a hydrogeological characterization effort that is part of the remedial investigation/feasibility study-environmental impact statement process being carried out by the US Department of Energy at the site. This report presents the results of model development and calibration. In the calibration procedure, the range of field-measured hydrogeological parameters was tested to obtain the best match between model-predicted and measured groundwater elevations. After calibration, the model was used to evaluate whether the presence of an on-site disposal cell would impact the ability to remediate contaminated groundwater beneath the cell. The results of the numerical modeling, which were based on an evaluation of steady-state groundwater flow velocity plots, indicated that groundwater would flow beneath the disposal cell along natural gradients. The presence of a disposal cell would not significantly affect remediation capability for groundwater contamination.

23095 (CONF-920791–, pp. 3, Paper 1) **Overview of EM Small Business Technology Integration Program.** Paladino, J. (Dept. of Energy, Washington, DC (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The Environmental Management Small Business Technology Integration Program (EM SB-TIP) seeks the participation of small technology development businesses with less than 500 employees in U.S. Department of Energy (DOE) environmental restoration and waste management research, development, demonstration, test, and evaluation (RDDT&E). The purpose of this small business program is to find, evaluate, and apply advanced, innovative technologies for in-situ remediation; groundwater and soils treatment; characterization, sensors, and monitoring; mixed waste processing; efficient separation techniques; robotics; and decontamination and decommissioning.

23096 (CONF-920791–, pp. 4, Paper 2) **Environmental management technology development overview.** Voelker, G. (Dept. of Energy, Washington, DC (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The U.S. Department of Energy (DOE) made a public commitment in 1989 to remediate more than 40 years of radioactive, hazardous, and mixed waste at its weapons production sites by 2019. The scope of the commitment is large: more than 3,700 sites and 26,000 acres of contaminated land awaiting remediation, over 500 surplus sites awaiting decontamination and decommissioning, and 5,000 peripheral sites with contaminated soil. DOE's Office of Environmental Restoration and Waste Management (EM), the organization overseeing DOE's environmental cleanup efforts, leads an aggressive, national, multibillion dollar research, development, demonstration, test, and evaluation (RDDT&E) program for cleaning up DOE weapons manufacturing sites. This technology development program delivers environmental restoration and waste management technologies better, faster, safer, and cheaper than those currently available. EM's environmental cleanup activities focus on two areas: environmental restoration to clean up DOE's sites and waste management to control and reduce the waste generated by DOE sites. EM's Office of Waste Operation is responsible for DOE's waste management activities, and EM's Office of Environmental Restoration focuses on DOE's environmental restoration efforts. EM's Office of Technology Development conducts the RDDT&E to develop innovative environmental restoration systems for the EM Offices of Waste Operations and Environmental Restoration when adequate technologies do not exist to meet DOE's environmental cleanup requirements.

23097 (CONF-920791–, pp. 9, Paper 3) **Characterization, monitoring and sensor technology for environmental restoration and waste management.** Roelant, D.; Purdy, C. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

To ensure that new and effective characterization, monitoring and sensor technologies (CMST) are provided to the Department of Energy (DOE) remediation efforts, DOE's Office of Technology Development within the Office of Environmental Restoration and Waste Management (EM) has established an Integrated Program (IP) on CMST. This CMST-IP focuses in the short-term on matching and adapting available CMST technologies to help solve EM problems at DOE sites. In the long-term, it aims to stimulate, coordinate and sponsor relevant research and development; and to promote and publicize available baseline CMST and developments of newly emerging technologies. Development of field-screening technologies by this IP will emphasize field-deployable instrumentation and noninvasive methods. Overall, the support of specific technology development will depend upon benefit to cost ratios, overall savings to EM, the development's link to Records of Decision at DOE sites, the critical nature of the need addressed, the ability of development to be utilized by multiple DOE sites and the degree to which the development represents an advance over baseline technologies. This paper discusses a variety of sensor technologies as well as the CMST-IP structure, efforts and current direction. The interaction of the CMST-IP with the Laboratory Management Division, Robotics Integrated Program, EMSL and other EM groups will also be addressed.

23098 (CONF-920791–, pp. 5, Paper 5) **Containerized mixed waste workshop tentatively scheduled: October, 1992.** Conway, S. (Colorado Center for Environmental Management, Golden (US)); Baldwin, C. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

In July 1991 the United States Department of Energy (DOE) awarded the Colorado Center for Environmental Management (CCEM) a five year grant to support its Technology/Regulatory Integration Project (TRIP). TRIP's goal is to develop and assess alternative ways for achieving effective citizen participation and timely regulatory review in the selection and implementation of innovative cleanup technologies for hazardous waste sites. CCEM is sponsoring this workshop to focus on the characterization of containerized mixed wastes. Participants will gain an overall understanding of the properties of these wastes and will develop strategies and techniques for the waste characterization as needed to meet regulatory and waste disposal site requirements and gain public acceptability. This effort will focus on containerized mixed waste throughout the DOE Complex rather than at any one site. The workshop will provide a national showcase for direct interaction among a broad array of technical, regulatory and public interests in addressing an important and timely DOE problem. In addition to technical experts within the DOE complex, the university community, and other organizations, the workshop will have active participation and input

from representatives of regulatory agencies, governmental and private disposal sites, local government, environmental organizations, and citizens' groups. The workshop should provide a snapshot of the state-of-the-art in techniques, technologies, and methods available to characterize containerized mixed waste. It will identify: gaps in the existing technical capabilities in characterization, priority R&D needs to fill those gaps, and areas where the university community and other technical experts can assist DOE (and possibly other federal agencies) by undertaking specific research initiatives related to the workshop's results.

23099 (CONF-920791–, pp. 4, Paper 11) **Cone penetrometer demonstration Westinghouse Hanford Company technology applications and testing.** Myers, D.R. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The usefulness of cone penetrometer technology for performing in situ characterization of single shell tank (SST) wastes and in situ characterization of contaminated soil sites at the Hanford Site has received considerable speculation. The cone penetrometer demonstration is primarily a feasibility test to determine if a cone penetrometer can penetrate the salt cake in the SST wastes and the coarse, gravelly Hanford Site soils. Additional interests include the characterization of the tank wastes for physical, chemical, and radiological properties, and the characterization of Hanford Site soils for geologic structure, presence of contaminants, and hydrologic properties. Two separate feasibility testing efforts were carried out, one for the SST wastes and a second for the characterization of contaminated soil sites. The tank waste testing was carried out using simulated SST wastes composed of simulated salt cake and sludge. The simulated salt cake was made from Sulfur K Mag, a commercially available fertilizer, and the sludge was simulated with a bentonite slurry. Columns of simulated waste were made using 55-gal (208.2 L) barrels welded end to end, forming test columns 27 in. (68.6 cm) in diameter and 6.5 ft (2 m) high. The strength of the salt cake was controlled by changing the amount of water added to the Sulfur K Mag, and several different thicknesses, of simulated salt cake were placed in the test columns. The simulated sludge (bentonite slurry) was placed in the test columns first and the simulated salt cake was placed on top and allowed to harden. The test columns then were tested individually by placing them in a lined test pit, which had been dug into the ground to allow the cone penetrometer to be placed over the columns for the testing. The penetrometer was then advanced into each of the test columns while the cone and sleeve forces were recorded.

23100 (CONF-920791–, pp. 6, Paper 27) **Characterization of site geochemistry in support of environmental restoration.** Morris, D.E. (Los Alamos National Lab., NM (US)); Conradson, S.D.; Tait, C.D.; Chisholm-Brause, C.J.; Berg, J.M.; Musgrave, J. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The objective of this task is to characterize the chemical speciation and physical properties of actinides and other toxic metals together with organic cocontaminants in contaminated soils at DOE facilities. The target information for chemical speciation will be the oxidation state of the metal, the chemical structure and stoichiometry of the metal complexes, and the binding mechanism(s) of the metal complexes to the soil substrates. The physical state of the metal complexes in the soils is also important. The authors will determine if they exist as surface precipitates, mineral coatings, and/or clay adsorbates. The chemical speciation and physical state of the actinides and toxic metals define the chemistry of these contaminants as they presently exist at the DOE sites. This information is made available to parties involved in devising and implementing remediation strategies so that appropriate, efficient, timely, and cost-effective remediation technologies will be brought to bear on the problem. Speciation characterization is also undertaken following the application of remediation technologies. This information is made available to parties involved with risk assessment so that judgments concerning the extent of decontamination and the long-term stability of any remaining contamination can be made and documented on the basis of sound chemical data. This task is presently funded by DOEs Office of Technology Development under the auspices of the Uranium in Soils Integrated Demonstration. The charge from the ID Coordinator is to focus on the speciation of uranium in contaminated soils at the Fernald Environmental Management Project site (formerly the Feed-Materials Production Center) in southwest Ohio. The results presented in this report specifically concern our work for this ID. However, the approach is generally valid for other actinides and many toxic metals that have the potential to exist in a variety of different chemical forms in the environment.

Field operable analytical systems that can provide data in real-time have a great advantage in that samples need not be collected, cataloged, transported, and stored prior to analysis; results can be obtained faster and more cost-effectively if the analyses can be done in the field. This is a particular advantage for samples that are radioactively contaminated. Minimizing the number of steps in the sample handling process minimizes the radiation exposure to workers; field sampling of radioactively contaminated materials can eliminate many of the concerns relating to storage and proper disposal after the analysis is completed. Also, on-site testing and analysis can provide data to determine whether remedial strategies and clean-up procedures are working. Ames Laboratory is developing a mobile analytical laboratory (mobile lab) designed to analyze radioactively contaminated soil samples using laser ablation (LA) and inductively coupled plasma atomic emission spectrometry (ICPAES). The soil surface is sampled by focusing laser radiation onto the soil; the ablated soil material is transported to an ICP for subsequent determination of the elemental composition of the soil based on the emission signals generated in the ICP and detected by the spectrometer. A robotic sampling system to enable sampling to be performed in highly radioactive environments is being incorporated into the system. The mobile lab will also have the capability of analyzing soil samples by subjecting them to a microwave digestion procedure for subsequent solution ICPAES determinations to be performed.

23102 (CONF-920791–, pp. 7, Paper 35) **The radiological and hazardous material measurement system (RHMMS).** Roney, T.J. (EG & G Idaho, Inc., Idaho Falls (US)); Johnson, L.O.; Klingler, T.B.; Karvinen, J.R.; McLaughlin, G.D.; Nieschmidt, E.B.; Shropshire, D.E. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

There is presently no system commercially available that will adequately identity and quantify uncharacterized transuranic(TRU)-contaminated wastes, either buried or containerized. Treatment facilities for TRU-contaminated wastes also need process control systems and final waste form assay systems capable of accurately measuring the TRU contamination levels at high measured volume throughput. Thus, the need exists for a system that will adequately

quantify transuranic waste, both retrieved and in fixed containers. For the reasons stated here, the development of the Radiological and Hazardous Material Measurement System (RHMMS) was initiated in 1989. This summary describes a system designed to quantify fissile and hazardous material for the remedial processes of retrieval, treatment, repackaging, transportation, and storage at a permanent site. Description of the technology and the need for the technology is given. The RHMMS concept of multiple measurements to reduce uncertainties in quantification is provided and contrasted with current assay systems.

23103 (CONF-920791–, pp. 6, Paper 36) **Mixed waste characterization strategy.** Baldwin, C.E. (EG & G Rocky Flats, Inc., Golden, CO (US)); Stakebake, J.; Peters, M. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Radioactive mixed wastes containing a radioactive component subject to the Atomic Energy Act (AEA) and a hazardous waste subject to Resource Conservation and Recovery Act (RCRA) are generated, treated, and stored at the Rocky Flats Plant (RFP) and are subject to federal and state statutory and regulatory requirements. The U.S. Environmental Protection Agency (EPA) and the Colorado Department of Health (CDH) are the two primary regulatory agencies which enforce these requirements. This paper describes the mechanism by which RFP will characterize mixed wastes within the LDR provisions of RCRA and the LDR FFCA as well as for meeting the waste acceptance criteria for disposal.

23104 (CONF-920791–, pp. 6, Paper 37) **Nondestructive characterization of TRU and LLW mixed-wastes using active and passive gamma-ray spectrometry/computed tomography.** Camp, D.C. (Lawrence Livermore National Lab., CA (US)); Martz, H.E. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The technology objective is to nondestructively characterize mixed wastes. This includes the localization, quantitation and identification of all detectable radioactivities within containerized waste. Once developed, the technology may also be able to identify heavy metals and non-volatile organic compounds within the waste container. The goal is to accurately quantitate all gamma-ray activity in wastes so that all waste types may be properly classified. More specifically, the authors are developing a prototype single, high-purity-germanium (1-HPGe), detector-based, contact-handled (CH), waste-drum scanner that uses gamma-ray spectrometry coupled with active (A) and passive (P) computed tomography (CT) to assay 208-L drums for their gamma-ray emitting radioisotopes. Once it is successfully demonstrated we will build a similar scanner will be built for Idaho National Engineering Laboratory. The ACT mode utilizes a highly collimated gamma-ray source to send a transmission beam though a drum. A collimated HPGe detector on the opposite side detects the attenuated gamma rays. If the attenuation is recorded as a function of translated and rotated drum positions, then an attenuation "map" of the waste-matrix is generated by well-known tomographic methods. Maps made at successive drum heights enable one to create three-dimensional (3-D) views of gamma-ray attenuations, which are related to atomic number and density variations within the waste matrix. Ratios of each drum slice or segment at different gamma-ray energies for a given drum height enable one to obtain effective-atomic-number and density information of the waste distribution.

23105 (CONF-920791–, pp. 9, Paper 38) **Contaminant analysis automation: Program overview.** Beugelsdijk, T.J. (Los Alamos National Lab., NM (US)). The environmental program, headed up by, Assistant Secretary Leo Duffy, thus become the fastest growing segment of the DOE In 1993, the DOE budget is projected at $19 billion, with about twenty five percent of that earmarked for environmental work. The largest share of the environmental budget is allocated to remediation contractors at the various DOE sites. However, several hundred million dollars are being devoted to the development of new technologies to aid in the cleanup process. This effort is being organized under the Office of Technology Development (OTD) within Leo Duffy's organization. The OTD charter is to effect the development of technologies that are currently unavailable. These technologies are to make the remediation effort proceed more quickly, more safely, and at a lower cost. included among the hundreds of technology development programs within the OTD, is a large robotics program. The effort was organized in the summer of 1989, starting with a site needs assessment. The needs assessment quickly focused the program on the major problems within DOE across the various sites and labs. These problems are summarized in Figure I and in the discussion below.

23106 (CONF-930396–9) **Implementation of in situ vitrification technology for remediation of Oak Ridge contaminated soil sites: Past results and future plans.** Tixier, J.S. (Pacific Northwest Lab., Richland, WA (United States)); Powell, T.D.; Spalding, B.P.; Jacobs, G.K. Oak Ridge National Lab., TN (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC06-76RL01830. From Waste management '93; Tucson, AZ (United States); 1-5 Mar 1993. Order Number DE93010335. Source: OSTI; NTIS; INIS; GPO Dep.

In situ vitrification is a thermal treatment technology being developed for remediation of contaminated soils. The process transforms easily leached, contaminated soils into a relatively inert, leach-resistant, vitreous and crystalline monolith. This paper presents the results of the recent highly successful ISV demonstration conducted jointly by PNL and ORNL on a tracer-level quantity of radioactive sludge in a model trench at ORNL. A retention of 90Sr in the vitreous and crystalline product of greater than 99.9999% was measured with a reduction in mobility of more than 2 orders of magnitude. The paper also presents the current plans for continued collaboration on a two setting treatability test on one portion of an old seepage pit at ORNL.

23107 (CONF-930769–3) **Advanced signal processing in geophysical remote sensing.** Witten, A.J. (Oak Ridge National Lab., TN (United States)); King, W.C. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1993 joint Canadian Society of Civil Engineers-American Society of Civil Engineers (CSCE-ASCE) national conference on environmental engineering; Montreal (Canada); 12-14 Jul 1993. Order Number DE93012753. Source: OSTI; NTIS; GPO Dep.

This paper describes advanced signal processing methods which have improved the capabilities to detect and image the subsurface environment with geophysical remote sensing techniques. Field results are presented showing target detection, subsurface characterizations, and imaging of insitu waste treatment processes, all previously unachievable with such tools as ground penetrating radar, magnetometry and seismic.

23108 (DOE/CH–9217) **Corrective Action Plan in response to the March 1992 Tiger Team Assessment of the Ames Laboratory.** Iowa State Univ. of Science and Technology, Ames, IA (United States). Inst. for Physical Research and Technology. 20 Nov 1992. 795p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (IS–5094). Order Number DE93011566. Source: OSTI; NTIS; INIS; GPO Dep.

On March 5, 1992, a Department of Energy (DOE) Tiger Team completed an assessment of the Ames Laboratory, located in Ames, Iowa. The purpose of the assessment was to provide the Secretary of Energy with a report on the status and performance of

Environment, Safety and Health (ES&H) programs at Ames Laboratory. Detailed findings of the assessment are presented in the report, DOE/EH-0237, Tiger Team Assessment of the Ames Laboratory. This document, the Ames Laboratory Corrective Action Plan (ALCAP), presents corrective actions to overcome deficiencies cited in the Tiger Team Assessment. The Tiger Team identified 53 Environmental findings, from which the Team derived four key findings. In the Safety and Health (S&H) area, 126 concerns were identified, eight of which were designated Category 11 (there were no Category I concerns). Seven key concerns were derived from the 126 concerns. The Management Subteam developed 19 findings which have been summarized in four key findings. The eight S&H Category 11 concerns identified in the Tiger Team Assessment were given prompt management attention. Actions to address these deficiencies have been described in individual corrective action plans, which were submitted to DOE Headquarters on March 20, 1992. The ALCAP includes actions described in this early response, as well as a long term strategy and framework for correcting all remaining deficiencies. Accordingly, the ALCAP presents the organizational structure, management systems, and specific responses that are being developed to implement corrective actions and to resolve root causes identified in the Tiger Team Assessment. The Chicago Field Office (CH), IowaState University (ISU), the Institute for Physical Research and Technology (IPRT), and Ames Laboratory prepared the ALCAP with input from the DOE Headquarters, Office of Energy Research (ER).

23109 (DOE/EH–0258T-1) **General Employee Radiological Training and Radiological Worker Training: Program management manual.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014777. Source: OSTI; NTIS; INIS; GPO Dep.

This manual defines and describes the DOE General Employee Radiological Training (GERT) and Radiological Worker I and II (RW I and II) Training programs. It includes material development requirements, standards and policies, and program administration. This manual applies to General Employee Radiological Training and Radiological Worker Training at all DOE contractor sites. The training materials of both GERT and RW I and II training reflect the requirements identified in the DOE Radiological Control Manual and DOE Order 5480.11. The training programs represent the minimum requirement for the standardized core materials. Each contractor shall implement the program in its entirety and may augment the standardized core materials to increase the general employee and radiological worker level of competency.

23110 (DOE/EH–0258T-2) **General Employee Radiological Training and Radiological Worker Training: Training aids.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 117p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014778. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains copies of slides used with radiological workers in General Employee Radiological Training (GERT).

23111 (DOE/EH–0259T-1) **General Employee Radiological Training: Lesson plan.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 19p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014779. Source: OSTI; NTIS; INIS; GPO Dep.

Upon completion of this class, the participant will be able to discuss his/her responsibilities for maintaining exposures to radiation and radioactive material As Low As Reasonably Achievable.

23112 (DOE/EH–0259T-2) **General Employee Radiological Training: Study guide.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 11p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014780. Source: OSTI; NTIS; INIS; GPO Dep.

Upon completion of this class, the participant will be able to discuss his/her responsibilities for maintaining exposures to radiation and radioactive material As Low As Reasonably Achievable. The participant will be able to select the correct response from a group of responses which verifies his/her ability to: Identify natural background and man-made sources of radiation; state the whole body radiation exposure limit for non-radiological workers; state the potential biological effects from chronic radiation exposure; identify the ALARA concept and practices; state methods used to control radiological material; and state employee responsibilities for the ALARA Program.

23113 (DOE/EH–0260T-1) **Radiological Worker Training: Radiological Worker 1 lesson plans.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 103p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014781. Source: OSTI; NTIS; INIS; GPO Dep.

Upon completion of this training course, the participant will have the knowledge to work safely in areas controlled for radiological purposes using proper radiological practices. Upon completion of this unit the participant will be able to identify the fundamentals of radiation, radioactive material and radioactive contamination. The participant will be able to select the correct response from a group of responses which verifies his/her ability to: Define ionizing radiation, radioactive material and radioactive contamination and identify the units used to measure radiation and radioactivity.

23114 (DOE/EH–0260T-2) **Radiological Worker Training: Radiological Worker 1 study guides.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 40p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014782. Source: OSTI; NTIS; INIS; GPO Dep.

Upon completion of this training course, the participant will have the knowledge to work safely in areas controlled for radiological purposes using proper radiological practices.

23115 (DOE/EH–0261T-1) **Radiological Worker Training: Radiological Worker 2 lesson plans.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 142p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014783. Source: OSTI; NTIS; INIS; GPO Dep.

Upon completion of this g course, the participant will have the knowledge to work safely in areas controlled for a radiological purposes using proper radiological practices. The participant will be able toidentify the fundamentals of radiation, radioactive material and radioactive contamination includes identify the three basic particles of an atom, define ionization, define ionizing radiation, radioactive material and radioactive contamination, distinguish between ionizing radiation and non-ionizing radiation, define radioactivity and radioactive half-life.

23116 (DOE/EH–0261T-2) **Radiological Worker Training: Radiological Worker 2 study guides.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 63p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014784. Source: OSTI; NTIS; INIS; GPO Dep.

Upon completion of this training course, the participant will have the knowledge to work safely in areas controlled for radiological purposes using proper radiological practices. Radiological Worker H Training, for the worker whose job assignment involves entry into Radiological Buffer Areas and all types of Radiation Contamination and Airborne Radioactivity Areas. This course is designed to prepare the worker to work safely in and around radiological areas and present methods to use to ensure individual radiation exposure is maintained As Low As Reasonably Achievable.

23117 (DOE/EH–0262T-1) **Radiological control technician: Training program management manual.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 15p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014785. Source: OSTI; NTIS; INIS; GPO Dep.

This manual defines and describes the DOE Radiological Control Technician Core Training Program qualification and training process, material development requirements, standards and policies, and administration. The manual applies to Radiological Control Technician Training Programs at all DOE contractor sites.

23118 (DOE/EH–0262T-2) **Radiological Control Technician: Standardized technician Qualification Standard.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014786. Source: OSTI; NTIS; INIS; GPO Dep.

The Qualification Standard states and defines the knowledge and skill requirements necessary for successful completion of the Radiological Control Technician Training Program. The standard is divided into three phases: Phase I concerns RCT Academic training. There are 13 lessons associated with the core academics program and 19 lessons associated with the site academics program. The staff member should sign the appropriate blocks upon successful completion of the examination for that lesson or group of lessons. In addition, facility specific lesson plans may be added to meet the knowledge requirements in the Job Performance Measures (JPM) of the practical program. Phase II concerns RCT core/site practical (JPMs) training. There are thirteen generic tasks associated with the core practical program. Both the trainer/evaluator and student should sign the appropriate block upon successful completion of the JPM. In addition, facility specific tasks may be added or generic tasks deleted based on the results of the facility job evaluation. Phase III concerns the oral examination board successful completion of the oral examination board is documented by the signature of the chairperson of the board. Upon completion of all of the standardized technician qualification requirements, final qualification is verified by the student and the manager of the Radiological Control Department and acknowledged by signatures on the qualification standard. The completed Qualification Standard shall be maintained as an official training record.

23119 (DOE/EH–0262T-3) **Radiological Control Technician: Phase 1, Core academic training lesson plans.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 213p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014787. Source: OSTI; NTIS; INIS; GPO Dep.

This volume provides instructors in the GERT program with lesson plans for Phase 1- Core Academic Training.

23120 (DOE/EH–0262T-4) **Radiological Control Technician: Phase 1, Core academic training study guides.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 241p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014788. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains a study guide for training Radiological control Technicians. Covered here are core academic training in basic nuclear science and radiobiology.

23121 (DOE/EH–0262T-5) **Radiological Control Technician: Phase 1, Site academic training lesson plans.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 325p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014789. Source: OSTI; NTIS; INIS; GPO Dep.

This volume provides lesson plans for training radiological control technicians. Covered here is basic radiological documentation, counting errors, dosimetry, environmental monitoring, and radiation instruments.

23122 (DOE/EH–0262T-6) **Radiological Control Technician: Phase 1, Site academic training study guides.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 213p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014790. Source: OSTI; NTIS; INIS; GPO Dep.

This volume is a study guide for training Radiological Control Technicians. Provided herein are support materials for learning radiological documentation, communication systems, counting errors and statistics, dosimetry, contamination control, airborne sampling program methods, respiratory protection, radiological source control, environmental monitoring, access control and work area setup, radiological work coverage, shipment and receipt for radioactive material, radiological incidents and emergencies, personnel decontamination, first aid, radiation survey instrumentation, contamination monitoring, air sampling, and counting room equipment.

23123 (DOE/EH–0262T-7) **Radiological Control Technician: Phase 2, Core/site practical training.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 34p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014791. Source: OSTI; NTIS; INIS; GPO Dep.

This volume provides a description of the guidelines, qualification in radiological instrumentation, qualification in radiological protection, and qualification in emergency preparedness for radiological control technicians.

23124 (DOE/EH–0262T-8) **Radiological Control Technician: Phase 2, Oral examination boards.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014792. Source: OSTI; NTIS; INIS; GPO Dep.

This section outlines methods and guidelines for the implementation of Radiological Control Technician (RCT) oral examination boards as required by the Radiological Control Manual (RCM).

23125 (DOE/EH–0262T-9) **Radiological Control Technician: Phase 4, Facility practical training attachment.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 5p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014793. Source: OSTI; NTIS; INIS; GPO Dep.

At DOE sites with more than one facility, and where RCT tasks at each facility may differ, site and facility tasks should be separated. The tasks that are common to all the facilities on the site should be included in Phase II training with the core tasks. Tasks unique to a facility should be added to the training program qualification standard, as an attachment, as Phase IV training. Not all the DOE sites will include Phase IV training in their programs. Phase IV training allows each site to qualify technicians to a select facility. Since the core training for the technicians is standardized, the transfer of technicians between facilities requires that only facility tasks be taught, provided the core qualification is current.

23126 (DOE/EH–0262T-10) **Radiological Control Technician: Training aids.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1992. 90p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014794. Source: OSTI; NTIS; INIS; GPO Dep.

This volume provides an outline of the lesson plan for General Employee Radiological Training (GERT).

23127 (DOE/OR–01-1115-D1) **Remedial Investigation work plan for Bear Creek Valley Operable Unit 4 (shallow groundwater in Bear Creek Valley) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee.** Oak Ridge Y-12 Plant, TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Dec 1992. 330p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (Y/ER–56-D1). Order Number DE93011835. Source: OSTI; NTIS; INIS; GPO Dep.

The enactment of the Resource Conservation and Recovery Act (RCRA) in 1976 and the Hazardous and Solid Waste Amendments (HSWA) to RCRA in 1984 created management requirements for hazardous waste fadities. The facilities within the Oak Ridge Reservation (ORR) were in the process of meeting the RCRA requirements when ORR was placed on the Comprehensive Environmental Response, Compensation, and Liability Act (CERCIA) National Priorities List (NPL) on November 21, 1989. Under RCRA, the actions typically follow the RCRA Facility Assessment (RIFA)/RCRA Facility Investigation (RFI)/Coffective Measures Study (CMS)/Corrective Measures Implementation process. Under CERCLA, the actions follow the Pre@ary Assessment/Site Investigation (PA/SI) Remedial Investigation Feasibility Study (RI/FS)/Remedial Design/Remedial Action process. The development of this document will incorporate requirements under both RCRA and CERCIA into an RI Work Plan for the lint phase of characterization of Bear Creek Valley (BCV) Operable Unit (OU) 4.

23128 (DOE/UMTRA–050506-Vol.5) **Remedial action plan and site design for stabilization of the inactive uranium mill tailings sites at Rifle, Colorado: Volume 5, Addenda D6–D8 to Appendix D: Final report.** USDOE Albuquerque Field Office, NM (United States). Uranium Mill Tailings Remedial Action Project Office. Feb 1990. 436p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-85AL20533. Order Number DE93012927. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains appendices D6 through D8 containing laboratory test data: from MK-F investigation, 1987, Old Rifle and New Rifle sites; on bentonite amended radon barrier material; and from MK-F investigation, 1987, riprap tests.

23129 (DPSP–55-454-5) **Savannah River Plant history plantwide activities, July 1954–December 1972.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. [1972]. 280p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–535). Order Number DE93012789. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report recounts the yearly activities of the Savannah River Plant nonproduction agencies and is concerned mainly with Plant personnel and items of general interest. The "History of Plantwide Activities" is published as an accumulative document; at the end of each year a new writeup is added to the volume to bring it up to date. Writeups for 1955 and 1956 are based on the governmental fiscal year; those for 1957 and subsequent years are on a calendar year basis. The history of the period from prestartup through June 30, 1953, is presented in DPSP 53-368; the history from July 1953 through June 1954 is presented in DPSP 54-448.

23130 (DPSTSA–200-10-Suppl.5-Del.Ver.) **Safety analysis, 200 Area, Savannah River Plant H-Canyon operations: Supplement 5.** Beary, M.M. (Science Applications International Corp., San Diego, CA (United States)); Collier, C.D.; Fairobent, L.A.; Graham, R.F.; Mason, C.L.; McDuffee, W.T.; Owen, T.L.; Walker, D.H. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab.; Science Applications International Corp., San Diego, CA (United States). Feb 1986. 403p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93009881. Source: OSTI; NTIS; GPO Dep.

The H-Canyon facility is located in the 200 Separations Area and uses the HM process to separate uranium, neptunium, plutonium, and fission products. Irradiated uranium fuels containing ^{235}U at enrichments from 1.1% to 94% are processed and recovered, along with neptunium and plutonium isotopes. This Safety Analysis Report (SAR) documents an analysis of the H-Canyon operations and is an update to a section of a previous SAR. This SAR documents an analysis of the H-Canyon and is one of a series of documents for the Separations Area as specified in the Savannah River Implementation Plans. A substantial amount of the information supporting the Conclusions of this SAR is found in the Systems Analysis. Some H-Canyon equipment has been updated during the time between the Systems Analysis and this SAR and a complete description of this equipment is included in this report. The primary purpose of the analysis was to demonstrate that the H-Carbon can be operated without due risk to onsite or offsite populations and to the environment. In this report, risk is defined an the expected frequency of an accident, multiplied by the resulting radiological consequence in person-rem. The units of risk for radiological does are person-rem/year. Maximum individual exposure values have also been calculated and reported.

23131 (EGG-M–93031) **TRANSAX 92: A multi-jurisdictional exercise.** Green, D.W. (USDOE Idaho Field Office, Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930402–3: 4. topical meeting on emergency preparedness and response, Long Island, NY (United States), 25-29 Apr 1993). Order Number DE93010806. Source: OSTI; NTIS; INIS; GPO Dep.

TRANSAX 92 was a national exercise sponsored by the Department of Energy that depicted a transportation accident involving a simulated transuranic waste shipment enroute to the Waste Isolation Pilot Plant in New Mexico. The participants in the exercise included federal, state, county, and tribal agencies. Personnel from the Shoshone-Bannock tribes served as the first responders. This created complex multi-jurisdictional issues to be resolved. As a result of the exercise, the capability to respond to transportation accidents involving hazardous materials in eastern Idaho was greatly enhanced.

23132 (FEMP–93010810) **Technology needs study: Fernald Environmental Management Project.** Westinghouse Environmental Management Co. of Ohio, Cincinnati, OH (United States). Fernald Environmental Management Project. Sep 1992. 260p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21600. Order Number DE93010810. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald Environmental Management Project (FEMP), formerly known as the Feed Materials Production Center and located approximately 20 miles northwest of Cincinnati, Ohio, was shut down in 1989 after producing uranium products since 1953. In October 1990, the site was transferred from DOE's Office of Defense Programs (DP) to the Office of Environmental Restoration and Waste Management (EM). Currently, EM is planning and conducting environmental remediation at the site. Uranium in metallic or chemical form is present in groundwater, soils, disposal pits, storage silos, and production facilities. Remediation involves using physical and chemical methods to accumulate uranium and its associated decay products and to prepare them for disposal. Observations and recommendations in this study were made for FEMP, EM-40, and EM-50 activities.

23133 (IS–5096) **Characterization, Monitoring and Sensor Technology Integrated Program.** Ames Lab., IA (United States); USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. [1993]. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE93011563. Source: OSTI; NTIS; INIS; GPO Dep.

This booklet contains summary sheets that describe FY 1993 characterization, monitoring, and sensor technology (CMST) development projects. Currently, 32 projects are funded, 22 through the OTD Characterization, Monitoring, and Sensor Technology Integrated Program (CMST-IP), 8 through the OTD Program Research and Development Announcement (PRDA) activity managed by the Morgantown Energy Technology Center (METC), and 2 through Interagency Agreements (IAGs). This booklet is not inclusive of those CMST projects which are funded through Integrated Demonstrations (IDs) and other Integrated Programs (IPs). The projects are in six areas: Expedited Site Characterization; Contaminants in Soils and Groundwater; Geophysical and Hydrogeological Measurements; Mixed Wastes in Drums, Burial Grounds, and USTs; Remediation, D&D, and Waste Process Monitoring; and Performance Specifications and Program Support. A task description, technology needs, accomplishments and technology transfer information is given for each project.

23134 (KY/ER–15) **Evaluation of the proposed pilot groundwater pump and treat demonstration for the Paducah Gaseous Diffusion Plant: Environmental Restoration Program.** Bodenstein, G.W.; Bonczek, R.R.; Early, T.O.; Hale, T.B.; Huff, D.D.; Nickelson, M.D.; Rightmire, C.T. Paducah Gaseous Diffusion Plant, KY (United States). Nov 1992. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC05-76OU00001. (ORNL/M–2542). Order Number DE93012077. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the evaluation and recommendations of a Groundwater Corrective Actions Review Team. The primary goal is to evaluate the technical merit of and the need to implement a proposed groundwater pump-and-treat demonstration project for the Northwest contaminant plume at Paducah, Kentucky. A key distinction recognized by the review team is that the proposed project is intended to be a full-scale hydraulic containment of contaminants migrating from the sources of the plume, not plume remediation. The key questions incorporated into this plan are whether (1) dense, nonaqueous-phase liquids (DNAPLS) are present in the Regional Gravel Aquifer (RGA) at the source of the plume and (2) ^{99}Tc removal must be included as part of any groundwater treatment process. The first question cannot be answered until the

contaminant sources are better defined; the second question requires further risk assessment and/or a policy decision by DOE. Technical evaluation by the review team suggests that the recommended course of action be to modify the proposed work plan to include accurate identification of the sources of contaminants and vertical distribution of contaminants within the Northwest plume before a decision is made on the preferred source-control option. If DNAPLs are not present in the RGA, removal or containment of the sources is recommended. If DNAPLs are present, then hydraulic containment will be required. Finally, the review team recognizes that it is necessary to initiate a more comprehensive analysis of sitewide remediation needs to create links between action taken for the Northwest plume and action taken for other contamination sites at PGPD.

23135 (LA-UR–93-1366) **Radiological hazard classification of DOE facilities by DOE STD-1027-92: LANL nuclear facility list.** Elder, J.C. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304128–4: Department of Energy (DOE) radiation protection conference, Las Vegas, NV (United States), 13-15 Apr 1993). Order Number DE93012664. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos facilities containing significant radiological hazards have been reclassified according to DOE-SID 1027-92, a recently issued guide for hazard classification. DOE-STD 1027-92 was provided in support of DOE Order 5480.23 to identify which facilities would be governed under DOE 5480.23 requirements; these would presumably be called nuclear facilities. This new classification has affected the original list of 18 LANL nuclear facilities by increasing it to 39. It has also lowered the classification of TA-55-4, the plutonium processing facility containing highest intrinsic hazard at LANL, from the highest classification to an intermediate classification. This presentation addresses the impact of these changes in the nuclear facility list in the areas of radiological health, safety analysis documentation, and risk management.

23136 **Safety harness.** Gunter, L.W. To Dept. of Energy. 8 Apr 1991. USA patent application 7-681,291. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93008217. Source: OSTI; NTIS; GPO Dep.

A safety harness to be worn by a worker, especially a worker wearing a plastic suit thereunder for protection in a radioactive or chemically hostile environment. The safety harness comprises a torso surrounding portion with at least one horizontal strap for adjustably securing the harness about the torso, two vertical shoulder straps with rings just forward of the of the peak of the shoulders for attaching a life-line and a pair of adjustable leg supporting straps releasibly attachable to the torso surrounding portion. In the event of a fall, the weight of the worker, when his fall is broken and he is suspended from the rings with his body angled slightly back and chest up, will be borne by the portion of the leg straps behind his buttocks rather than between his legs. Furthermore, the supporting straps do not restrict the air supplied through hoses into his suit when so suspended.

23137 (PNL–8144) **State trends in ecological risk assessment and standard setting.** Siegel, M.R.; Fowler, K.M.; Bilyard, G.R. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93008948. Source: OSTI; NTIS; INIS; GPO Dep.

The purposes of this paper are (1) to identify key states' activities and plans related to setting cleanup standards using the ecological risk assessment process, and (2) to discuss the impacts these actions may have on the US Department of Energy's (DOE's) environmental restoration program. This report is prepared as part of a larger task, the purpose of which is to identify and assess state regulatory trends and legal developments that may impact DOE's environmental restoration program. Results of this task are intended to provide DOE with advance notice of potentially significant regulatory developments so as to enhance DOE's ability to influence these developments and to incorporate possible regulatory and policy changes into its planning process.

23138 (PNL–8570) **Evaluation of S-101 course Supervisors' Orientation to Occupational Safety in DOE" taught in Aiken, South Carolina, September 15–18, 1992.** Wright, T.S. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93010357. Source: OSTI; NTIS; GPO Dep.

This section summarizes trainee evaluations for the Safety Training Section course, "Supervisors' Orientation to Occupational Safety in DOE", (S-101) which was conducted September 15–18, 1992 at Westinghouse Savannah River, in Aiken, South Carolina. Sections 1.1 and 1.2 of this report summarize the quantitative course evaluations that trainees provided upon completion of the course. Section 1.3 summarizes the trainees written comments on the course and Section 1.4 provides examination results. Appendix A provides a transcript of the trainees' written comments and Appendix B presents the trainee evaluation form which students were asked to complete.

23139 (PNL–8572) **Evaluation of S-101 course "Supervisors' Orientation to Occupational Safety in DOE" taught in Amarillo, Texas, November 17–20, 1992.** Wright, T.S. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93010358. Source: OSTI; NTIS; GPO Dep.

This summarizes trainee evaluations for the Safety Training Section course, "Supervisors' Orientation to Occupational Safety in DOE", (S-101) which was conducted November 17–20, 1992 at the Pantex Plant, in Amarillo, Texas. Sections 1.1 and 1.2 of this report summarize the quantitative course evaluations that trainees provided upon completion of the course. Section 1.3 provides written comments provided by the attendee, and Section 1.4 provides the examination results. Appendix A provides a transcript of the trainees' written comments and Appendix B provides the evaluation form.

23140 (PNL–8652) **Review of accident analysis calculations, 232-Z seismic scenario: Letter report.** Ballinger, M.Y. Pacific Northwest Lab., Richland, WA (United States). May 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014184. Source: OSTI; NTIS; INIS; GPO Dep.

The 232-Z Building houses what was previously the incinerator facility, which is no longer in service. It is constructed out of concrete blocks and is approximately 37 ft wide by 57 ft long. The building has a single story over the process areas and two stories over the service areas at the north end of the building. The respective roofs are 15 ft and 19 ft above grade and consist of concrete over a metal decking, with insulation and a built-up asphalt gravel covering. This facility is assumed to collapse in the seismic event evaluated in the safety analyses, resulting in the release of a portion of the residual plutonium inventory remaining in the building. The seismic scenario for 232-Z assumes that the block concrete walls collapse, allowing the roof to fall, crushing the contaminated duct and gloveboxes within. This paper is a review of the scenario and methods used to calculate the source term from the seismic event as presented in the Plutonium Finishing Plant Final Safety Analysis Report (WHC 1991) also referred to as the PFP FSAR. Alternate methods of estimating the source term are presented. The calculation of source terms based on the mechanisms of release expected in worst-case scenario is recommended.

23141 (PNL-SA–20747) **The increasing importance of risk assessment and management in environmental decision-making.** Jaksch, J.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9206114–21: Annual meeting of the Air and Waste Management Association (AWMA), Kansas City, MO (United States), 21-26 Jun 1992). Order Number DE93009217. Source: OSTI; NTIS; GPO Dep.

Because environmental problems are growing and resources for dealing with them are shrinking, the environmental movement is witnessing an evolutionary shift toward greater emphasis on the

use of risk assessment and management tools in setting environmental standards, determining levels of cleanup and deciding environmental program funding priorities. This change has important ramifications for the Department of Energy (DOE) and its national laboratories in terms of the costs of weapons facilities cleanup, the types of cleanup technology that will be emphasized and the way the DOE programs will be run. Other Federal agencies responsible for cleanup operations [e.g., the Environmental Protection Agency (EPA) and the Department of Defense (DOD)] will be similarly affected. This paper defines risk management and risk assessment and explains why these concepts will be of growing importance in the 1990s. It also defines other relevant terms. The paper develops a rationale for why risk assessment and management will be of increasing importance in environmental decision-making in the 1990s and beyond.

23142 (PNL-SA–20922) **Recent advances in in situ vitrification.** Bonner, W.F.; Luey, Ja-Kael. Pacific Northwest Lab., Richland, WA (United States). May 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920527–10: 1992 incineration conference, Albuquerque, NM (United States), 11-14 May 1992). Order Number DE93007869. Source: OSTI; NTIS; GPO Dep.

In Situ Vitrification (ISV) is an innovative mobile remediation technology for soils and other underground contamination: Developed by the US Department of Energy's Pacific Northwest Laboratory (PNL), ISV has advanced during the past decade from a laboratory concept to a remediation technology commercially available for contaminated soils. ISV technology is currently being developed for remediation of DOE waste sites at Hanford, Oak Ridge National Laboratory (ORNL) Idaho National Laboratory (INEL), and other sites. The incentives for application of ISV can convert contaminated sites to a solid, highly durable block similar to naturally occurring obsidian. The ISV product has been shown capable of passing US Environmental Protection Agency (EPA) tests such as the Toxic Characteristic Leach Procedure (TCLP). Retrieval, handling and transport of untreated hazardous material would normally not be required after application of ISV. Therefore, costs, exposure to personnel, risk of releases to the environment, and generation of secondary wastes are greatly reduced compared with remove-and-treat technologies.

23143 (PNL-SA–20984) **Assessing the public regulatory acceptability of deploying new cleanup technologies: A case study of the integrated demonstration for Remediation of Volatile Organic Compounds at Arid Sites.** McCabe, G.H. (Battelle Seattle Research Center, WA (United States)); Stein, S.L. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920851–87: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93008261. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is funding several integrated demonstrations (IDs) around the United States in an effort to improve the pace and effectiveness of cleaning up its sites. The objective of these IDs is to demonstrate an array of innovative cleanup technologies that address the specific needs at a site and to provide deployable technologies to all DOE sites with similar environmental problems. This approach eliminates the need to redemonstrate these technologies at multiple sites, thereby minimizing technology development cost and schedule requirements. However, for an ID to be truly successful, the technologies must be technically sound, acceptable to the various interested or concerned individuals and groups who feel they have a stake in the case (often referred to as stakeholders), and acceptable to the regulators responsible for approving the technologies' deployment. As a result, the ID for Remediation of Volatile Organic Compounds at Arid Sites (VOC-Arid ID) has instituted a process for assessing public and regulatory acceptability of the technologies that it is developing. As part of this process, an information system has been developed that describes the innovative technologies being supported under the VOC-Arid ID. It also compares innovative technologies with the baseline technologies currently in use by environmental restoration personnel.

23144 (PNL-SA–21476) **Overview of the Hanford Environmental Thermoluminescent Dosimetry Program.** Endres, A.W.; Peters, J.D. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930130–13: 26. Health Physics Society midyear topical meeting on environmental health physics, Coeur d'Alene, ID (United States), 24-28 Jan 1993). Order Number DE93007885. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Environmental Thermoluminescent Dosimetry Program has been in operation for 30 years. The program's main goal is to report ambient penetrating radiation levels at specified locations on the Hanford Site and at nearby and distant communities. Dosimeter processing, dose calculation, and dose-reporting functions are provided by the Instrumentation and External Dosimetry section of the Pacific Northwest Laboratory's Health Physics Department. This presentation provides a brief historical overview of dosimeter designs, processing procedures, dose-calculation methodologies, calibration techniques, and quality control.

23145 (PNL-SA–21731) **In situ redox manipulation: Enhancement of contaminant destruction and immobilization.** Fruchter, J.S. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930160–8: 2. semi-annual Office of Technology Development (OTD) information meeting, Houston, TX (United States), 26-28 Jan 1993). Order Number DE93007877. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses a project to develop, test, and evaluate in situ methods for immobilizing inorganic contaminants (metals, inorganic ions, and radionuclides) and destroying nitrates organic contaminants, (primarily chlorinated hydrocarbons). This research work is being performed for the US Department of Energy through the In situ Remediation Integrated Program.

23146 (PNL-SA–22020) **An effective, non-threatening approach to evaluating safety program performance.** Wright, R.E. (Pacific Northwest Lab., Richland, WA (United States)); Walters, D.S.; Hillman, B.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304127–1: Southeastern safety and health conference and exhibition, Atlanta, GA (United States), 26-28 Apr 1993). Order Number DE93013159. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy has initiated a program to ensure a continual improvement in industrial safety at its facilities throughout the United States. To accomplish this, the Department of Energy is performing self-assessments of its safety programs. These assessments are effective at identifying program weaknesses without assigning fault to individuals. Line managers view this process as supportive because it has helped identify program deficiencies that are preventing them from accomplishing their desired safety goals. Three attributes of this assessment process account for its effectiveness. First, the assessment addresses the entire line management's safety program from policy to implementation in the work place. The assessment report describes how the safety program functions, where program deficiencies exist, and the effect of those deficiencies on safety in the field. Second, the assessment findings focus on program weaknesses that have been validated by observations of safety deficiencies found in the work place. Finally, the report is methodically written to ensure that findings are related only to program weaknesses and not personnel shortcomings. This effective, no-fault approach, has been demonstrated at Department of Energy facilities and could benefit safety programs in private industry.

23147 (UCRL-ID–111791) **Occupational consequences and source term calculations for a tritium release in the Device Assembly Facility (DAF).** Nguyen, D.H. Lawrence Livermore National Lab., CA (United States). Jan 1993. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93008753. Source: OSTI; NTIS; GPO Dep.

Tritium gas, normally in sealed containers, will be present in the Department of Energy (DOE)'s facilities conducting fusion energy research or weapon operations. A probability of tritium release, however small, exists in these facilities. Once released, tritium can back-diffuse against ventilation flow to contaminate other areas of

the facility. Tritium can also be released to the environment by exhaust blowers. The problem of back-diffusion of tritium released in a typical DOE facility was examined as a function of flow rates of the ventilation system. The "source term" (release to the environment) at the emergency ventilation flow was also calculated. The consequences to the occupational personnel in the release room, and in an adjacent corridor due to back-diffusion were determined. It was shown that for credible release scenarios, the consequences in the adjacent corridor from tritium back-diffusion were negligible. Higher doses in the release room can be avoided by well-planned emergency evacuation procedures. Although the "source term" was calculated, the on-site and off-site consequences were not determined in this study.

23148 (UCRL-JC–110582-Rev.1) **Development and evaluation of a HEPA filter for increased strength and resistance to elevated temperature: Revision 1.** Gilbert, H. (Gilbert (Humphrey), McLean, VA (United States)); Bergman, W.; Fretthold, J.K. Lawrence Livermore National Lab., CA (United States). Jan 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920823–7-Rev.1: 22. Department of Energy (DOE)/Nuclear Regulatory Commission (NRC) nuclear air cleaning and treatment conference, Denver, CO (United States), 24-27 Aug 1992). Order Number DE93008023. Source: OSTI; NTIS; INIS; GPO Dep.

We have completed a preliminary study of an improved HEPA filter for increased strength and resistance to elevated temperature to improve the reliability of the standard deep pleated HEPA filter under accident conditions. The improvements to the HEPA filter consist of a silicone rubber sealant and a new HEPA medium reinforced with a glass cloth. Three prototype filters were built and evaluated for temperature and pressure resistance and resistance to rough handling. The temperature resistance test consisted of exposing the HEPA filter to 1,000 scan (1,700 m^3/hr) at 700°F (371°C) for five minutes.The pressure resistance test consisted of exposing the HEPA filter to a differential pressure of 10 in. w.g. (2.5 kPa) using a water saturated air flow at 95°F (35°C). For the rough handling test, we used a vibrating machine designated the Q110. DOP filter efficiency tests were performed before and after each of the environmental tests. In addition to following the standard practice of using a separate new filter for each environmental test, we also subjected the same filter to the elevated temperature test followed by the pressure resistance test. The efficiency test results show that the improved HEPA filter is significantly better than the standard HEPA filter. Further studies are recommended to evaluate the improved HEPA filter and to assess its performance under more severe accident conditions.

23149 (WSRC-MS–93-146) **Report on Subgroup on Data Banks for Risk Assessment.** Durant, W.S. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9306143–1: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93012150. Source: OSTI; NTIS; GPO Dep.

As a result of discussions between the Westinghouse Management and Operations (M&O) Nuclear Facility Safety Committee and Stephen M. Blush, Director of Nuclear Safety, US Department of Energy, the Safety Analysis Working Group Steering Committee agreed to sponsor the formation of a subgroup on data banks for risk assessment. The newly created Safety Analysis Working Group Subgroup on Data Banks for Risk Assessment met February 2–3, 1993 in Augusta Georgia. This report highlights the topics of this meeting.

This system is a remote monitoring system for continual verification of security and safeguards status of nuclear material. The CASDAC system consists of two subsystems, one of them is a Grand Command Center (GCC) subsystem and the other is a facility subsystem. This report describes the outline and usage of the On-Site Multiplexer (OSM), which controls all other equipments in a facility subsystem and communicates with the GCC. This work has been carried out in the framework of Japan Support Programme for Agency Safeguards (JASPAS) as a project, JA-1. (author).

23153 (K/CSD/INF–87/13-Rev.1) **Nuclear Materials Management and Safeguards System (NMMSS): Revision 1.** Jacobsen, S.E.; Matthews, W.B. III; McKamy, E.D.; Pedigo, R.B. Oak Ridge K-25 Site, TN (United States). [1991]. 4p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-910774–106-Rev.1: 32. Institute of Nuclear Materials Management (INMM) annual meeting, New Orleans, LA (United States), 28-31 Jul 1991). Order Number DE93009336. Source: OSTI; NTIS; GPO Dep.

This paper describes the Nuclear Materials Management and Safeguards System (NMMSS) which is sponsored by the Department of Energy and the Nuclear Regulatory Commission. The system serves national security and program management interests, and international interests in the programs for the peaceful application of nuclear energy and non-proliferation of nuclear weapons. Within the scope of the NMMSS are found all nuclear materials applied and controlled under United States law and related international agreements, including U.S. nuclear materials production programs and US private nuclear industrial activities. In addition, its national and international scope enables it to provide services to other organizations such as the Arms Control and Disarmament Agency, the Department of State, and the US Congress.

23154 (K/ITP–486) **Field measurements to support IAEA procedures development for fuel assembly and fuel rod active length verification.** Belew, W.L.; Cooley, J.N.; Whitaker, J.M. Oak Ridge K-25 Site, TN (United States). 17 Jul 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. (CONF-9207102–79: Institute of Nuclear Materials Management (INMM) annual meeting, Orlando, FL (United States), 19-22 Jul 1992). Order Number DE93012415. Source: OSTI; NTIS; INIS; GPO Dep.

The activities performed in verification of reactor fuel rods and assemblies by International Atomic Energy Agency (IAEA) safeguards inspectors include measurements of the length of the enriched uranium sections in fuel assemblies and fuel rods. These measurements are normally made with the IAEA hand-held gamma monitor (HM-4) on fuel elements containing only enriched uranium. Many fuel rods currently in use contain natural uranium end sections and several different ^{235}U enrichment zones. To support development of standard procedures for IAEA nondestructive assay (NDA) measurements, a field measurement campaign was carried out to evaluate the FM-4 measurements and to investigate the feasibility of extending the HM-4 measurements to fuel rods and assemblies containing both natural and enriched uranium sections. The results show that the enriched fuel length can be measured to within $\pm$ 1 to 2 cm in the presence of natural uranium sections and to within $\pm$ 0.5 = when only enriched uranium is present. Based on the results from these measurements, a standard procedure, "Measurement of Active Fuel Length in Fuel Assemblies and Fuel Rods Using the HM-4," has been drafted for review by the IAEA.

23155 (SAND–92-2781C) **Portable Reconfigurable Line Sensor (PRLS).** Buckle, T.H.; Christiansen, M.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305110–2: Expo 93, Oak Ridge, TN (United States), May 1993). Order Number DE93013756. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Portable Reconfigurable Line Sensor (PRLS) is a bistatic, pulsed-doppler radar security sensor developed at Sandia National Laboratories for the US Air Force. The PRLS is rapidly and easily deployed byunskilled personnel and can detect intruders ranging from a slow creeping person to a high speed vehicle. The sensor has a sharply defined detection zone and will not falsely alarm on nearby traffic. Unlike other microwave sensor systems, the PRLS requires no alignment or calibration. Alignment is not required because the PRLS is equipped with an omnidirectional antenna. The PRLS's unique ellipsoidal detection zone eliminates the need for an offset distance to achieve total detection coverage. The sensors themselves are inside their own detection zone and are therefore self-protecting. Other unique features of the PRLS areits limited terrain-following capability and its ability to minimize the effects of rippling water and blowing grass. Its portability, battery operation, ease of setup and RF aldrin reporting capability make itan excellent choice for perimeter, portal, and gap-filler applications in the important new field of rapidly-deployable sensor systems. Sandia is currently transferring the PRLS technology to a private firm, Racon, Inc. (Seattle, WA), through an Air Force/Racon Cooperative Research and Development Agreement (CRADA). Through the CRADA, Sandia engineers are working with Racon engineers to develop a commercial version of the PRLS. Racon receives the benefit of Sandia security systems and radar development expertise, while Sandia engineers are gaining valuable exposure to important commercial manufacturing constraints and requirements. The Racon product will be available in 1993.

23156 (UCRL-ID–106470) **Evaluating safeguards effectiveness against protracted theft of special nuclear material by insiders.** Al-Ayat, R.A.; Patenaude, C.J.; Sicherman, A. Lawrence Livermore National Lab., CA (United States). Feb 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93011878. Source: OSTI; NTIS; GPO Dep.

The new draft DOE Material Control and Accountability Order 5633.3 requires that facilities handling special nuclear material (SNM) evaluate their effectiveness against protracted theft of SNM. Protracted theft means repeated thefts of small quantities of material to accumulate a goal quantity. To evaluate the safeguards effectiveness against protracted thefts, one must addresses several issues: (1) defining relevant time frames for various threat scenarios and delayed detection safeguards; (2) identifying which safeguards come into play more than once because of repeated adversary actions or because of periodic occurrence during the theft time frame (e.g., daily administrative check on presence of material); (3) considering whether the second and subsequent applications of safeguards are different in effectiveness from the first; (4) synthesizing how physical security, material control, and material accountability safeguards combine to provide protection against protracted theft scenarios. In this paper we discuss these issues and describe how we are augmenting the Analytic System and Software for Evaluating Safeguards and Security (ASSESS) to provide the user with a tool for evaluating effectiveness against protracted theft. Currently, the Insider module of ASSESS focuses on evaluating the "timely" detection of abrupt theft attempts by various types of single nonviolent insiders. In this paper we describe the approach we're implementing to augment ASSESS to handle various cases of protracted theft attempts.

23157 (UCRL-JC–110102) **Multi-state modeling in ASSESS.** Fortney, D.S. (Lawrence Livermore National Lab., CA (United States)); Patenaude, C.J.; Snell, M.K.; Key, B. Lawrence Livermore National Lab., CA (United States). 6 Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC04-76DP00789. (CONF-9207102–80: Institute of Nuclear Materials Management (INMM) annual meeting, Orlando, FL (United States), 19-22 Jul 1992). Order Number DE93012485. Source: OSTI; NTIS; GPO Dep.

The Analytic System and Software for Evaluating Safeguards and Security (ASSESS) is an integrated safeguards evaluation tool focusing on theft and diversion of special nuclear material (SNM) by insiders, outsiders, and collusion between insiders and outsiders. ASSESS features a common Facility Description module that allows for defining a facility's safeguards and security system simultaneously for both insiderand outsider threats. This Facility Description module supports defining safeguards during two states. The two states could represent "day" and "night," or "normal" and "emergency," or simply "open" and "closed." A problem arises due to differences in the modi operandi of (and hence, evaluation approaches for) insider and outsider threats. This can lead to situations where it is impossible to simultaneously define states correctly to meet the needs of both the Insider and Outsider evaluation modules. We have developed and are currently implementing an approach to address this problem. This approach has required-programming in four ASSESS modules. In this paper, we discuss the ASSESS state problem and give an overview of the solution, including the implementation in the Facility and Insider modules. A second paper discussing details of the implementation in the Outsider module is also being presented in this session.

23158 (UCRL-JC–110107) **A simulation model for uranium recovery processes.** Chang, L. (Lawrence Livermore National Lab., CA (United States)); Edmunds, T.A.; Knox, T.T.; Johns, R.E. Lawrence Livermore National Lab., CA (United States). 17 Jul 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9207102–73: Institute of Nuclear Materials Management (INMM) annual meeting, Orlando, FL (United States), 19-22 Jul 1992). Order Number DE93009522. Source: OSTI; NTIS; GPO Dep.

The Portsmouth Gaseous Diffusion Plant will suspend production of highly enriched uranium (HEU). Suspension plans require that equipment containing significant amounts of HEU deposits be disassembled, decontaminated, and placed on standby. The procedural, personnel and hardware limitations of the uranium recovery facility may delay this effort, in part because this same facility must maintain concurrent support for the decontamination of equipment used for low enrichment operations. To facilitate planning and operations for this clean-up effort, a model that simulates facility operation and obtains estimates of the time to clean up all HEU-contaminated components has been developed. The model simulates the effects of random events, such as machine breakdowns, and uncertain parameters, such as contamination levels,

on the facility process flow. The model has been used to evaluate alternative process configurations and operating procedures in the uranium recovery facility.

23159 (WHC-SA–1870) **The Hanford Site multiple function badge demonstration project.** Nelson, R.A. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9304111–2: Magnetic stripe card technology seminar: CardTech/Secur/Tech, Arlington, VA (United States), 19 Apr 1993). Order Number DE93011353. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy Hanford Site is an original defense production site dating from World War II. The US Department of Energy assigned a new waste management mission for the Hanford Site. This mission requires fewer manned security posts and more areas restricted because of safety and environmental concerns. Entry into these areas requires specific safety and environmental qualifications, which could be controlled by automated access control systems. Automated entry reduces costs of managing the Site but requires health physics, safety, employee training, security databases integration, and a network system. Another approach, avoiding integration, is individuals carrying this information on their person as a picture identity badge and access control token. The health physics, safety, employee training, and security regulations that define access requirements may be best served using a smart card as the access control token. This paper discusses the need for information distribution and automated access control, potential approaches for solving the need, and smart card work at the Hanford Site.

23160 (INIS-XN–436) **31 March 1992 - Royal Order amending Section 133(1) of the General Regulation on safety at Work concerning protection of workers against the hazards of ionizing radiation.** Belgium. 24 Apr 1992. [2p.] (In French). Order Number DE93626595. Source: OSTI; NTIS (US Sales Only); INIS.

Published in Moniteur belge.

A Royal Order of 31 March 1992 amends certain provisions of the Regulations on safety at work with respect to protection of workers against the hazards of ionizing radiation, amended in 1990. The purpose of the amendment is to avoid that certain international and national civil servants be hindered in their control duties. The following inspectors are concerned: the International Atomic Energy Agency inspectors; the persons designated as responsible for surveillance under the Euratom Treaty and the Act of 1955 on State security in the nuclear field; the inspectors designated by the Act of 1972 on inspections at work. (NEA).

23161 (INIS-XN–437) **17 June 1992 - Royal Order amending the Royal Order of 28 February 1963 laying down the General Regulations for protection of the population and workers against the hazards of ionizing radiation.** Belgium. 23 Jun 1992. [3p.] (In French). Order Number DE93626585. Source: OSTI; NTIS (US Sales Only); INIS.

Published in Moniteur belge.

This Royal Order replaces certain provisions of the General Regulations for protection of the population and workers against the hazards of ionizing radiations. The new provisions concern the monitoring of radioactivity in the national territory and population dose, as well as monitoring of the population as a whole. The purpose of this amendment is to conform without delay to the Opinion of the Commission of the European Communities; the amendment concerns mainly the monitoring of doses received by the population and the technical conditions for such monitoring. (NEA).

23162 (INIS-XN–439) **SOR/92-150 - 27 February 1992 - Transport Packaging of Radioactive Materials Regulations, Amendment.** Canada. 11 Mar 1992. [2p.] Order Number DE93626590. Source: OSTI; NTIS (US Sales Only); INIS.

Published in Canada Gazette Part II Vol. 126 No 6.

The amendments to the Transport Packaging of Radioactive Materials Regulations now simplify the registration procedure for obtaining certificates for package designs. (NEA).

23163 (INIS-XN–440) **SOR/92-149 - 27 February 1992 - AECB Cost Recovery Fees Regulations, amendment.** Canada. 11 Mar 1992. [3p.] Order Number DE93626591. Source: OSTI; NTIS (US Sales Only); INIS.

Published in Canada Gazette Part III Vol. 126 No 6.

The AECB began in 1990 to charge fees for the registration of each user of a certified package for the transport radioactive materials. This amendment was made to simplify the registration procedure. (NEA).

23164 (INIS-XN–441) **Order of 23 May 1991 on electron accelerators using energies of from 1 MeV to 50 MeV for the treatment of patients.** Denmark. 31 May 1991. [6p.] (In Danish). Order Number DE93626586. Source: OSTI; NTIS (US Sales Only); INIS.

Published in Lovtidende 1991 Part A, No 70.

This order made by the National Board of Health also implements Directive No. 84/466 Euratom of 3 September 1984 laying down basic measures for radiation protection of persons undergoing medical treatment. The Order prescribes measures to protect patients treated by electron accelerators using energies from 1 MeV to 50 MeV. It contains provisions on approval procedures for electron accelerators, their design, the shielding and safety systems for premises where they are housed, their supervision and quality control and finally, their inspection by the Board of Health. (NEA).

23165 (INIS-XN–442) **Order of 24 July 1992 on the licensing of liquid radioactive effluent releases from the large nuclear installation called Atalante at the nuclear research centre in the Rhone valley on the Marcoule nuclear site.** France. 22 Aug 1992. [1p.] (In French). Order Number DE93626587. Source: OSTI; NTIS (US Sales Only); INIS.

Published in the Journal Official de la Republique francaise.

This Order fixes the annual authorized limits and procedures for the transfer from Atalante to the Cogema establishment also at Marcoule of the low-level liquid effluents for treatment. It also specifies the measures for their control and surveillance. (NEA).

23166 (INIS-XN–443) **Order of 24 July 1992 on the licensing of gaseous radioactive effluent releases from the large nuclear installations called Atalante at the nuclear research centre in the Rhone valley on the Marcoule nuclear site.** France. 29 Aug 1992. [1p.] (In French). Order Number DE93626588. Source: OSTI; NTIS (US Sales Only); INIS.

Published in the Journal Officiel de la Republique francaise.

This Order fixes the annual authorized limits and procedures for radioactive effluent releases from Atalante. It also specifies the measures for their control and surveillance. (NEA).

23167 (INIS-XN–444) **Radioactive Material (Road Transport) Act 1991.** United Kingdom. 27 Jun 1991. [7p.] Order Number DE93626592. Source: OSTI; NTIS (US Sales Only); INIS.

This Act came into force on 27 August 1991. It replaces earlier legislation dating from 1948 and enables the United Kingdom to give effect to the International Atomic Energy Agency's (IAEA) latest recommended Regulations for the Safe Transport of Radioactive Material. The new Act clarifies and extends the power of the Secretary of State to make regulations regarding, among other things, the design, labelling, handling, transport and delivery of packages containing radioactive material and the placarding of vehicles transporting such packages. The Act gives the Secretary of State the power to appoint inspectors to assist him in enforcing the regulations. (NEA).

23168 (INIS-XN–445) **Health Ministry - Regulatory Decree No 3/92 of 6 March.** Portugal. 6 Mar 1992. [2p.] (In Portuguese). Order Number DE93626589. Source: OSTI; NTIS (US Sales Only); INIS.

Published in Diario da Republica - I Serie B No 55.

The 1990 Decree, adopted in implementation of the Euratom Directives laying down basic radiation protection standards, establishes the basic principles in the field of radiation protection applicable to occupationally exposed persons, individuals and the

population as a whole. This Decree amends the 1990 Decree to further clarify certain of its provisions. Consequently, a new paragraph has been added to Section 36 of the 1990 Decree on exemptions which specifies in particular the cases which are not exempted from prior licensing. (NEA).

The Oak Ridge National Laboratory Isotope Distribution Program (IOP) provides isotope research materials for research, development, and production applications. Most of the isotopes of elements in the periodic chart are available on an international basis, from this program. The general list of materials and services are detailed below: radioisotopes, enriched stable isotopes, special nuclear materials, and unique isotope products and services. In addition to the above, routine fabrication processes are available to prepare both stable and radioisotope samples to meet the most stringent requirements. Specific details on isotopic materials and services available through the IOP can be obtained by writing to the following address: Oak Ridge National Laboratory, Isotope Distribution Program, P.O. Box 2008, Building 3037, Oak Ridge, Tennessee 37831, Phone 615-574-6984. (author). Abstract only.

23171 (INDC(NDS)–213/GM3, pp. 49) **Supply of samples and targets by CBNM, Geel, Belgium.** Pauwels, J. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). Source: OSTI; NTIS (US Sales Only); INIS.

Samples and targets for nuclear measurements have been supplied by CBNM for more than 25 years. They are generally supplied upon request according to specifications to be agreed upon between the customer and the laboratory. They include: Thin layers of several actinide and other materials of nuclear interest prepared by vacuum deposition, electrospraying, spraypainting, etc. Most targets can be supplied on very thin substrate foils, especially on 20 to 40 $\mu g/cm^2$ polyimide foils. Under optimal conditions the number of nuclide atoms can be determined with accuracies below 1%; Bulk samples of metals or oxides prepared from fine materials and/or enriched isotopes; Alloy samples in different forms and shapes prepared by quantitative alloying using e.g. high-frequency levitation melting. These include dosimetry alloys (e.g. AlCo, AlU, VNp,...), metallic spikes for isotope dilution mass spectrometry (e.g. U-Pu alloys), etc.; Reference materials for the non-destructive analysis of the isotope composition of uranium or for reactor neutron dosimetry ($^{238}UO_2$, $^{237}NpO_2$, Ni, Cu, Fe, Al, Nb, AlCo). Finally, more than 1000, mainly actinide deposits are available from stock. A regularly updated computer list of these can be obtained upon request. (author). Abstract only.

Source: OSTI; NTIS (US Sales Only); INIS.

A wide range of active and stable isotopes from ^{6}Li through to ^{252}Cf are currently available from the Harwell laboratory. Nuclides can be supplied as solids, liquids and targets manufactured to customers specifications. ^{57}Fe and ^{119}Sn for use as Moessbauer absorbers are held in stock. An extensive range of carbon foils for use as beam stripper foils and target backings can be manufactured. Radioactive sources of single or multiple nuclides can be prepared and calibrated to high accuracy. ^{252}Cf fabricated for use as fission fragment sources are held in stock. Tracer solutions of ^{227}Ac through to ^{252}Cf for environmental and dio-equilibrium studies are available from stock. Enquiries are invited for variable energy cyclotron (VEC) or reactor produced nuclides. A UK export license is required for some isotopes and information on the end use and user may be required. Enquiries should be addressed to: Actinide Chemistry and Analysis Group, Chemistry Division, Harwell Laboratory, Oxfordshire OX11 0RA, England, Telex 83135, Telephone (0235) 24141 ext. 4212. 23174 (INIS-JP–007, pp. 309-317) **Achievements and perspectives for radiation processing.** Charlesby, A. (RMC, Swindon (UK)). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution in beam applications.* Order Number DE93703820. Source: OSTI; NTIS; INIS.

In the last few decades the major practical applications of large radiation sources have been in the irradiation of macromolecular

systems. These have risen rapidly to annual outputs of billions of dollars and continue to show steady growth. In other directions such as polymerization and grafting, radiation has been less successful, primarily because in these subjects radiation serves as only one step in a sequence of chemical reactions, and often these can be achieved by more conventional and familiar methods. We envisage future progress along several distinct lines. 1. Reduction in the cost of radiation. 2. The application of radiation technology in areas where valuable modifications are involved and where advantage can be taken of the remarkable control offered by electron beams. 3. Areas where the chemical alternatives do not exist or are difficult to apply. 4. A very different line of approach is to use radiation with its far more complete control and reproducibility to investigate many processes even if in the production stage itself a different technique is later utilized. Present examples are chemical kinetics as with ESR, pulse radiolysis, pulsed NMR, behavior of trapped charges, crystal structure, local modifications, reinforcement and orientation etc. (J.P.N.).

23175 (INIS-JP–007, pp. 410-416) **Environmental and conservation considerations for electron curing.** Nablo, S.V. (Energy Sciences, Inc., Wilmington, MA (United States)); Fletcher, P.M. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution in beam applications.* Order Number DE93703820. Source: OSTI; NTIS; INIS.

This paper reviews the more important features of electron curing pertaining to environmental protection and conservation. The high electrical conversion efficiencies of these devices measured at output power levels to 200 kilowatts are reviewed with attention to energy transport to the product. The comparative energetics of free radical initiated addition chemistry with that of the more conventional condensation polymerized systems are presented. Some details of recent studies of the repulpability and de-inkability of electron cured products are presented with mill scale trials showing successful recycling with up to 75 % EB processed material in the waste. The ability of energetic electrons to effectively replace toxic chemicals such as H_2O_2 and ethylene oxide in product sterilization will be presented with a discussion of the regulatory aspects of this process for medical device applications. (author).

23176 (INIS-JP–007, pp. 505-510) **Some chemical properties of irradiated empty fruit bunch and palm press fiber of oil palm byproducts.** Matsuhashi, Shinpei (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establishment); Kume, Tamikazu; Othman, Z.BT.; Awang, M.R. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution in beam applications.* Order Number DE93703820. Source: OSTI; NTIS; INIS.

Effect of irradiation and alkali treatment for digestibility of oil palm by-products by commercial enzymes was investigated to obtain the informations about formation of carbohydrate polymers or sugar components for producing animal feed from cellulosic by-products. According to the colorimetric analysis, produced reducing sugar from holocellulose of Empty Fruit Bunch (EFB) and Palm Press Fiber (PPF) by Cellulase ONOZUKA 3S were about ten times higher than those from raw samples. The results show that the digestibility of EFB and PPF increased significantly by delignification. The differences of digestibility between irradiated and unirradiated samples were shown clearly by the combination of enzymatic degradation and the HPLC analysis. By irradiation, digestibility of EFB was significantly increased. Higher dose is more effective for the digestion of EFB by enzyme. Alkali treatment is also quite effective to enzymatic degradation. The difference of neutral sugar component was observed between alkali treated and untreated samples. These results suggest that the combination of alkali treatment and irradiation is effective for digestion by enzyme. The analysis of products by HPLC after enzymatic degradation is useful method to examine the digestibility and the sugar composition of oil palm by-products. (author).

23177 (INIS-JP–007, pp. 614-619) **Formation of particle tracks in solids and their technological application.** Spohr, R. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution in beam applications.* Order Number DE93703820. Source: OSTI; NTIS; INIS.

The phenomenon of discrete, directed, and developable ion tracks opens the possibility to structure and modify materials with individual atomic particles on a mesoscopic scale at a high level of pre-determination. The depth and sharpness of this microtool foreshadows new stimuli for a variety of fields. The technique is based on the possibility to amplify a quasi one-dimensional damage zone - engraved by the passage of an ion through an insulating solid - chemically by several orders of magnitude - a key feature for the practical application of the technique. The report reviews the exploration of the technique and outlines its relevant properties applicable to materials science and microstructure technology: Basic features of ion tracks - creation of defects - enhancement and annealing - selective chemical etching - available parameters, Ion track applications - single pores - filtration and membranes - stimulus-responsive membranes - creation of anisotropy - heavy-ion lithography - surface texture - focussed ion beams. Collaboration between JAERI and ORNL on research and development is proceeding well, to the great benefit of the DOE program. Plans for destructive testing at Japan's Nuclear Safety Research Reactor of uranium silicide fuel miniplates are well advanced; these tests could not be done anywhere in the US Other important areas of work, including supercontainment design studies, were also discussed. Initial plans for a January 1993 review or steering group meeting on the R&D collaboration were discussed. Initial plans for the IGORR-II meeting in 1993 were also agreed.

23180 (ORNL/M–2711) **Ion implantation effects on surface-mechanical properties of metals and polymers.** Rao, G.R. Oak Ridge National Lab., TN (United States). Apr 1993. 207p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014661. Source: OSTI; NTIS; GPO Dep.

Fatigue of 8 complex alloys based on Fe-13Cr-15Ni-2Mo-2Mn-0.2Ti-0.8Si- 0.06C, and single-crystal Fe-15Cr-15Ni, implanted with 400-keV B^+ and 550-keV N^+ (total dose 2.3×10^{16} ions/cm^2) was examined. 600 C creep was also examined. The dual implantation increased hardness but decreased fatigue life of the 8 complex alloys. An optimum strengthening level and a shift to grain boundary cracking were determined. The single crystals also showed reduced fatigue life after implantation. High temperature creep of E1 and B1 alloys were improved by the dual implantation. Four polymers (PE, polypropylene, polystyrene, polyethersulfone) were implanted with 200keV B^+ to 3 different doses. PS was also implanted with both B^+ and Ar^+. Near-surface hardness and tribological properties were measured. The hardness increased with dose and energy; wear also improved, with an optimum dose. (DLC)

Univ., Austin, TX (United States). Dept. of Electrical and Computer Engineering); Irby, J.; Kinosky, D.; Qian, R.; Thomas, S.; Banerjee, S.; Tasch, A.; Picraux, T. Sandia National Labs., Albuquerque, NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920690–1: Atomic layer epitaxy, Raleigh, NC (United States), 3-5 Jun 1992). Order Number DE93011674. Source: OSTI; NTIS; GPO Dep.

We have demonstrated removal of H from a H-passivated Si(100) surface by low energy (~50 eV) He ion bombardment. The extent of the removal of H from the surface can be controlled by varying the duration of He bombardment and plasma parameters. This, in turn, means that the growth rate by this method can also be controlled. Si_2H_6 was shown to adsorb in a self-limiting manner on the Si(100) surface.

23182 (UCRL-JC–111802) **X-ray lasers as sources for x-ray microscopy.** MacGowan, B.J. Lawrence Livermore National Lab., CA (United States). Jul 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792–60: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93013420. Source: OSTI; NTIS; GPO Dep.

Laboratory x-ray lasers are currently being developed by researchers worldwide as potential sources for x-ray imaging and other applications. Laser action has been demonstrated at wavelengths as short as 35.6 A and there is a large effort underway to enhance the coherent power output of the Ni-like Ta x-ray laser at 44.83 A as a source for x-ray imaging of live cells. Part of this effort is dedicated to producing a more affordable, compact laser to pump the x-ray laser in order to increase the accessibility of x-ray laser sources.

23183 (DOE/SF/18852–T25) **GPHS-RTGs in support of the Cassini mission: Semi annual technical report, 28 September 1992–28 March 1993.** Martin Marietta Astro Space, Philadelphia, PA (United States). [1993]. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-91SF18852. Order Number DE93011911. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The technical progress achieved during the period 28 September 1992 through 28 March 1993 on Contract DE-AC03-91SF18852, Radioisotope Generators and Ancillary Activities is described herein. This report is organized by the program task structure as follows: spacecraft integration and liaison; engineering support; safety; qualified uncouple production; ETG fabrication, assemble, and test; ground support equipment (GSE); RTG shipping and launch support; designs, reviews, and mission applications; project management, quality assurance, reliability, contract changes, noncapital CAGO acquisition, and CAGO maintenance; and CAGO acquisition (capital funds).

0705 Health and Safety

23184 (NUREG/CR–5962) **Health and safety impacts from discrete sources of naturally-occurring and accelerator-produced radioactive materials (NARM).** Nussbaumer, D. (Advanced Systems Technology, Inc., Atlanta, GA (United States)); Wiblin, C.; Welch, L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Advanced Systems Technology, Inc., Atlanta, GA (United States). Feb 1993. 44p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report characterizes discrete sources of naturally-occurring and accelerator-produced radioactive material (NARM) and estimates risks posed by the possession, use and disposal of them. A distinction between discrete and diffuse NARM sources is made with discrete sources being high activity, low volume and diffuse sources being low activity, high volume. Two nanocuries per gram is used as a separation guide between high and low activity, although use of this value does not impact the report's conclusions. Most NARM is under regulatory control of States that either license or register users but reporting requirements are not uniform. Use in consumer products has declined with virtually no production today; however, lack of information available concerning radiation exposures resulting form possession of ageing radium sources precludes a quantitative risk assessment in this report. The report identifies the type of information needed to permit such an assessment. Regarding accelerator-produced radioactive material (ARM), use of this material in nuclear medicine programs has recently increased. Available radiation exposure data regarding ARM handling and use indicates that the risk to workers and the public is low at this time.

23185 (WSRC-MS–93-148) **Summary of the Savannah River Site Criticality Dosimetry Program.** Crase, K.W. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9306149–1: CED international nuclear accident dosimeter intercomparison conference, Dijon (France), 7-8 Jun 1993). Order Number DE93011708. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Savannah River Site (SRS) includes working with fissionable materials. A program is in place, therefore, to assess neutron and gamma doses to individuals in the event of a criticality accident at SRS. The program consists of a method to quickly screen for potentially exposed personnel, a method to provide early but preliminary dose estimates, and a nuclear accident dosimeter and assay procedure to enable final dose estimates.

23187 (CONF-9207203–, pp. 43-46) **Synthesis of hydrocarbons from natural gas and carbon dioxide.** Yamazaki, O. (The University of Tokyo, Tokyo (Japan). Faculty of Engineering); Nozaki, T.; Omata, K.; Fujimoto, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Study was made of two-stage reaction to produce synthesized gas by the CH4-CO2 reforming reaction in the first stage and synthesize liquid hydrocarbon by the Fischer-Tropsch (FT) method in the second stage. Carbon is deposited on the catalyst surface and the catalyst is therefore inactivated in case of nickel catalyst with alumina carrier in the reforming reaction, while nickel catalyst with high basicity MgO-CaO carrier is stably active for many hours even under a CH4-rich condition and produces synthesized gas of an almost equilibrated composition. The basic catalyst strongly adsorbs acidic compounds such as C2 and its surface is therefore covered with them so that the carbon deposition by surplus hydrogen picked out from CH4 is controlled, which mitigates the degradation in catalytic activity. Conventional ferrous catalyst is rapidly inactivated by the carbon deposition in the FT reaction where the base material is the synthesized gas after reformed at 1/1 in CO/H2 ratio. However, newly developed Co-La/SiO2 catalyst is stably active for many hours and gives a high selectivity to the liquid hydrocarbon synthesis. 3 refs., 4 figs.

23188 (DPW–4466) **[Travel to Amarillo Helium Plants to secure background information on helium handling and oil removal from compressed helium]: Trip report, January 16-17, 1952.** Cherney, B.J. Purpose of this trip was to participate in both the International Symposium on Metal-Hydrogen Systems, Fundamentals and Applications, Uppsala University, Uppsala, Sweden, June 7–12, 1992, and in technical discussions at the Institut fuer Festkorperforschung, Forschungszentrum (KFA), Juelich, Germany, June 15–17, 1992.

09 BIOMASS FUELS

23190 (DOE/FTR–93012254) **Travel to Florence, Italy to assess the state of the European (EEC) biomass to energy (bioenergy) program direction, and of the research and development advances in the recently completed Joule program: Foreign trip report, October 3–12, 1992.** Overend, R.P.; Bull, S.R. National Renewable Energy Lab., Golden, CO (United States). 11 Nov 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93012254. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The conference is a major review of the EEC programs with very little non-EEC participation. The format is to have plenary discussion papers, some technical oral papers (Bull made a presentation entitled "Strategies for Biomass Implementation: Alliance Between Government and Industry") and in addition a lot of poster papers (Bull presented a poster entitled Total Fuel Cycle Environmental Outputs of Biomass to Ethanol Production) by individual researchers. There are workshops (Overend chaired one on biofuels development) and time for extensive discussion of technology and policy. The technologies and science displayed were on par with those ongoing in the USA, In the crop production program, there are a series of centers that pay attention to crops such as sorghum and miscanthus, which are not in the US program to any great extent. In conversion technologies the emphasis is on the use of existing agricultural crops such as sugar beet and oilseeds to manufacture ethanol and biodiesel respectively. These products do not require much R&D at this stage and the EEC has announced a policy of de-taxation that will have a major impact on the alternative fuels market place. The major R&D thrust is in electricity production - mostly through the biocrude oil route. There are three pilot plant or scaleups in progress, and there is extensive laboratory research on off properties and upgrading. In addition, the Italian Utility, ENEL, is undertaking a closed cycle biomass demonstration that incorporates sorghum production on 75 ha, and its conversion into a biocrude using Canadian technology - the biocrude will be used to co-fire an existing utility boiler. Biomass funding in Europe is likely to increase significantly in the next few years and the meeting gave a clear set of directions that will be followed and these are discussed in the report.

23191 (CONF-921276–, pp. 275-278) **Production of tall-golden-rod in Hamamatsu city.** Imoto, I. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Tall-golden-rod (TGR) which serves as a natural energy source was investigated in production status in Hamamatsu City. The production quantity was indirectly assumed from the product of production quantity per unit area (dry weight density) multiplied by the area of plant community portion (vegetation-covered area) as surveyed by ranging over. The dry weight of taller stalks than 10cm above the ground was considered to be the production quantity. The city was divided into 1056 sections each of which is 500m in north-south distance by 400m in east-west distance. Among those sections, 32 ones were surveyed at random. The ratio of the area, in which the number of existing taller stalks than 1.2m was more than one per spuare meter, to the whole area of the said section was considered to be the vegetation-covered ratio. The production quantity by Hamamatsu City attained to 750 (370 to 1140) tons in 1991. The histogram of logarithm of the above ratio gave a normal distribution. That ratio is high on the agricultural land and the TGR is more propagative than the large weeds. The production quantity attained to 3.24kg/m^2 at the largest in the place abundant in water and nutriment. The logarithm of product of the heaviest dry weight multiplied by the number of stalks within one square meter (M) is positively correlative with the logarithm of dry weight density (W). Therefore, it is effective as well as simple to obtain the W and assume the production quantity by using the M which can be simply measured. 5 refs., 6 figs., 2 tabs.

23192 (CONF-9211101–10) **New switchgrass biofuels research program for the Southeast.** McLaughlin, S.B. Oak Ridge National Lab., TN (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual automotive development technology contractors' coordination meeting; Dearborn, MI (United States); 2-5 Nov 1992. Order Number DE93012764. Source: OSTI; NTIS; GPO Dep.

The Biofuels Feedstock Development Program (BFDP) has selected a perennial crop, switchgrass, Panicum virgalum, as a model species for further development as a biofuels feedstock. The selection of switchgrass was based on several significant attributes, including its demonstrated high productivity across a wide geographical range, suitability for marginal quantity land, low water and nutrient requirements, and positive environmental attributes. A series of six research projects was initiated in 1992 to pin important new information on the yield potential of this species as a biofuels crop. These projects are evaluating the most promising existing varieties in regional field trials, cultural treatments to enhance the establishment and growth of stands, breeding for superior

yield, identification of physiological markers for assessing and promoting improved growth and development, and the development of tissue culture techniques for biotechnological improvement. These tasks combine the interrelated needs of realizing maximum near-term pins in productivity potential through cultural improvement and the longer term requirements for enhancing and protecting yield capacity.

23193 (NEI-DK–1168) **Full scale management of straw: Partial report 1. Gathering and stacking of straw.** Astrupgaard, N.P.; Stenholm, M. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. Mar 1993. [50p.] (In Danish). Contract ENS-51161-92.0046. Order Number DE93794694. Source: OSTI; NTIS.

An investigation was carried out of the steps in the processes carried out in the field concerning cutting and stacking of straw which is to be used as fuel in district heating plants. The preparation of 14 of 25 stacks on Lolland, Falster and Zealand (Denmark) was followed minutely. Five different commercial types of cutting machinery, two of which were self-propelling, were used. Measurement of moisture content, load weight, time taken for cutting and loading, transport and unloading, and netto and brutto capacity reckoned in tons per hour etc. were carried out in relation to each kind of equipment. All results are presented in detail. It is concluded that straw should be stacked continuously in connection with baling. It was found that the amount of work was 9% less with cut than with baled straw. Prices asked by the various firms who provided, worked and drove the various machines are also given. (AB).

23194 (CONF-9207203–, pp. 215-218) **Thermochemical conversion of cellulose with nickel metal catalyst.** Minowa, T. (National Institute for Resources and Environment, Tsukuba (Japan)); Ogi, T.; Yokoyama, S. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting*. Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

With an objective of converting cellulose to hydrocarbon to develop a biomass utilizing method, discussions were given on reaction of cellulose under high temperature and pressure with presence of water, using nickel metal catalysts. The nickel metal catalysts used included two kinds of commercially available catalysts and four kinds of prepared catalysts. One gram of material cellulose and 0.5 g of Ni catalyst are placed in an autoclave, displaced of N2 stirred and heated under an initial pressure of 2 MPa to predetermined temperatures (350°C), 400°C, and then retained for 30 minutes. The produced gas was low-grade hydrocarbon with a carbon number from 1 to 5. The reactions at 350°C with and without the catalysts resulted in gasification rates of 15.5% → 17% → 49% and hydrocarbon producing rates of 0.8% → 1.8% → 5.9%, indicating the catalytic effect. Adding alkali metal salt into the reaction system as an auxiliary catalyst caused these rates to either improve or reduce depending kinds of the catalyst. 4 refs., 1 tab.

23195 (DOE/ER/13255–9) **[Hydroxyproline: Rich glycoproteins of the plant and cell wall]: Annual technical progress report, 1993.** Varner, J.E. Washington Univ., St. Louis, MO (United States). 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13255. Order Number DE93014842. Source: OSTI; NTIS; GPO Dep.

Since xylem tissue includes the main cell types which are lignified, we are interested in gene expression of glycine-rich proteins and proline-rich proteins, and other proteins which are involved in secondary cell wall thickening during xylogenesis. Since the main feature of xylogenesis is the deposition of additional wall components, study of the mechanism of xylogenesis will greatly advance our knowledge of the synthesis and assembly of wall macromolecules. We are using the in vitro xylogenesis system from isolated Zinnia mesophyll cells to isolate genes which are specifically expressed during xylogenesis. We have used subtractive hybridization methods to isolate a number of cDNA clones for differentially regulated genes from the cells after hormonal induction. So far, we have partially characterized 18 different cDNA clones from 239 positive clones. These differentially regulated genes can be divided into three sets according to the characteristics of gene expression in the induction medium and the control medium. The first set is induced in both the induction medium and the control medium without hormones. The second set is induced mainly in the induction medium and in the control medium with the addition of NAA alone. Two of thesegenes are exclusively induced by auxin. The third set of genes is induced mainly in the induction medium. Since these genes are not induced by either auxin or cytokinin alone, they may be directly involved in the process of xylogenesis. Our experiments on the localization of H_2O_2 production reinforce the earlier ideas of others that H_2O_2 is involved in normal lignification.

23196 (DOE/ER/13370–T2) **[Conversion of acetic acid to methane by thermophiles]: Progress report, May 15, 1989–May 14, 1993.** Zinder, S.H. Cornell Univ., Ithaca, NY (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER13370. Order Number DE93014433. Source: OSTI; NTIS; GPO Dep.

The primary goal of this project is to obtain a better understanding of thermophilic microorganisms which convert acetic acid to CH_4. The previous funding period represents a departure from earlier research in this laboratory, which was more physiological and ecological. The present work is centered on the biochemistry of the thermophile Methanothrix sp. strain CALS-1. this organism presents a unique opportunity, with its purity and relatively rapid growth, to do comparative biochemical studies with the other major acetotrophic genus Methanosarcina. We previously found that Methanothrix is capable of using acetate at concentrations 100 fold lower than Methanosarcina. This finding suggests that there are significant differences in the pathways of methanogenesis from acetate in the two genera.

23197 (DOE/ER/13717–3) **Role of proteolytic enzymes in degradation of plant tissues: Summary of results of studies completed on the prior.** Lewosz, J.; Kelman, A.; Sequeira, L. Wisconsin Univ., Madison, WI (United States). Dept. of Plant Pathology. [1991]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13717. Order Number DE93015740. Source: OSTI; NTIS; GPO Dep.

Strain SR 394 of Erwinia carotovora (Ecc) produced proteases constitutively in all media tested. Growth of Ecc and production of protease were enhanced significantly by the presence of poetic materials and/or plant call walls in the test media. After electrofocusing, one major and one minor protease bands, at PI 4.8 and PI 5.1, respectively, were detected. Only one band of 43 kDa was detected on SDS gels. Only one protease band was detected in SDS gels of infected plant extracts. This protease was purified to homogeneity. It in a highly thermostable metal protease; it degrades gelatin, soluble collagen and hide powderazure, shows weak activity on casein and azocasein, but does not degrade insoluble collagen or elastin.

23198 (NEI-DK–1149) **Collective biogas plants: European experience in combined manure and waste processing. Proceedings.** Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. 249p. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). Order Number DE93794674. Source: OSTI; NTIS; INIS.

A THERMIE Programme Action.

Papers contributed to the European seminar on collective biogas plants held at Herning, Denmark on October 22-23 under the auspices of the Commission of the European Communities, Directorate-General for Energy (DG XVII) are presented. Within the framework of the THERMIE programme, a network of OPETs (Organizations for the Promotion of Energy Technologies) was set up in order to disseminate information on new energy technologies throughout the European communities. The potential for further implementation of centralized capacity for the conversion of animal manures and other organic wastes to bio-fuels, not only in central

and eastern Europe but also in the developing countries, is discussed in addition to the relevant technologies. Actual biomass conversion plants are described and details are given on operational experience and plant management. Agricultural, economic and policy aspects are also dealt with. (AB).

23199 (NEI-DK–1149, pp. 11-27) **State-of-the-art of large scale biogas plants.** Prisum, J.M. (Krueger Bigadan A/S, Soeborg (Denmark)); Noergaard, P. Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). In *Collective biogas plants: European experience in combined manure and waste processing. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

A survey of the technological state of large scale biogas plants in Europe treating manure is given. 83 plants are in operation at present. Of these, 16 are centralised digestion plants. Transport costs at centralised digestion plants amounts to between 25 and 40 percent of the total operational costs. Various transport equipment is used. Most large scale digesters are CSTRs, but serial, contact, 2-step, and plug-flow digesters are also found. Construction materials are mostly steel and concrete. Mesophilic digestion is most common (56%), thermophilic digestion is used in 17% of the plants, combined mesophilic and thermophilic digestion is used in 28% of the centralised plants. Mixing of digester content is performed with gas injection, propellers, and gas-liquid displacement. Heating is carried out using external or internal heat exchangers. Heat recovery is only used in Denmark. Gas purification equipment is commonplace, but not often needed. Several plants use separation of the digested manure, often as part of a post-treatment/-purification process or for the production of 'compost'. Screens, sieve belt separaters, centrifuges and filter presses are employed. The use of biogas varies considerably. In some cases, combined heat and power stations are supplying the grid and district heating systems. Other plants use only either the electricity or heat. (au).

23200 (NEI-DK–1149, pp. 31-40) **Results of a demonstration project: The Marsciano cooperative plant.** Poli, F. De (ENEA, Roma (Italy)). Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). In *Collective biogas plants: European experience in combined manure and waste processing. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

A consortial (cooperative) plant for the treatment of pig wastes was built in The Marsciano area (Perugia, Italy). The system was designed to recover all the available resources, both in terms of energy and in terms of materials. It is composed of an anaerobic digestion system (CSTR reactor, 15,000 m^3 working volume), producing over 20,000 m^3 of biogas/day, and a number of biogas operating devices (generators of electricity and heat, hay and crop dryer, tobacco dryer, greenhouses), that make all the biogas to be utilized with profit. The solid fraction of digested effluent is sold as fertilizer, the liquid is stored in lagoons for 9 months, and utilized during summer for fertilizing irrigation. The environmental problems of the area, both water pollution and odour emission, were completely solved with a low cost for the farmers, and the Municipality is likely to allow the realization of new pig farms. (au).

23201 (NEI-DK–1149, pp. 42-48) **Operational experinece with large scale biogas production at the promest manure processing plant in Helmond, the Netherlands.** Schomaker, A.H.H.M. (Haskoning, Royal Dutch Consulting Engineers and Architects, Nijmegen (Netherlands)). Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). In *Collective biogas plants: European experience in combined manure and waste processing. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

In The Netherlands a surplus of 15 million tons of liquid pig manure is produced yearly on intensive pig breeding farms. The dutch government has set a three-way policy to reduce this excess of manure: 1. conversion of animal fodder into a product with less and better ingestible nutrients; 2. distribution of the surplus to regions with a shortage of animal manure; 3. processing of the remainder of the surplus in large scale processing plants. The first large scale plant for the processing of liquid pig manure was put in operation in 1988 as a demonstration plant at Promest in Helmond. The design capacity of this plant is 100,000 tons of pig manure per year. The plant was initiated by the Manure Steering Committee of the province Noord-Brabant in order to prove at short notice whether large scale manure processing might contribute to the solution of the problem of the manure surplus in The Netherlands. This steering committee is a corporation of the national and provincial government and the agricultural industrial life. (au).

23202 (NEI-DK–1149, pp. 49-54) **Waste water treatment plant in Trebon.** Kajan, M. (COV (Czechoslovakia)). Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

A biomass conversion plant in Trebon, Czech Republic, aerobically digests municipal sewage wastes and pig manures. The plant includes aeration and settling tanks and a stabilization pond in order to deal with increasing supplies of sewage delivered by pumps from the town. The operation of the plant is briefly described. The liquid phase, after reduction of ammonia, is either retreated aerobically or used as fertilizer in fishponds or on fields. Experiments with waste water treatment using photoautotrophic microorganisms and production of biohumus from solid waste by vermis cultures are in progress. (AB).

A THERMIE Programme Action.

Herning Municipal Utilities has in 1988 constructed a full scale biogas plant for digestion of animal manure and industrial wastes. The plant receives manure from 40 farmers and wastes from several different kinds of industries - about 50,000 tons of raw materials are received each year. The material is digested thermophilic (at 53 deg. C) and since 1990 the gas yield has been high. In 1992 the average gasproduction has been about 6,000 m^3 per day. The gas is used for producing electricity and heat in three gasmotors. The heat is used for district heating and for process heating. Since the end of 1991 a new pilot plant for digestion of source separated household waste and liquid manure in combination is runned parallel to the existing plant. The treatment consists of pretreatment, digestion and postreatment of 1,000 tons of source separated organic household waste mixed with liquid manure in the ratio 1:4. So far the results seem very promising. The gasproduction is about 130 Nm^3 biogas per ton household waste and the produced fertilizer product is clean and with content of heavy metals below the limit value. The amount of material lost by separation is very low, less than 8 percent of the received household waste. (au).

A THERMIE Programme Action.

In Hungary, the implementation of biomass conversion using manures began during the nineteen-sixties and at this time much research was carried out in this field. The present deficiency in the relative equipment is due to political factors. Current calculations imply that 56 PJ per year can be generated from the total available biomass in Hungary, and that the semi-dry procedure is most suitable. Presently, agricultural wastes are now either burnt up or ploughed down after chopping and supplementing with fertilizers. An innovative semi-dry procedure of aerobic conversion is explained in detail and complex diagrams illustrate the text. The advantages of its use are that little energy is used for bringing the fermentation temperature up to the required level, operation is easy and flexible and the fermentors can be started up at any time and do not need a running-in period. The environmental advantages of using this system are many. The resulting manure waste from this form of aerobic conversion is not liquid and is more nutritious as a fertilizer. It is claimed that there is much interest in Hungary in establishing this type ofbiomass conversion and patents have been given and are applied for, but the country, because of past political problems, needs economical help for implementation. (AB).

23205 (NEI-DK–1180) **Handling of household wastes which are sorted at the source in preparation for energy and fertilizer production in collective biomass conversion plants.** Herning Kommunale Vaerker (Denmark). 1993. 101p. (In Danish). Contract ENS-51161-91.0010. Order Number DE93794761. Source: OSTI; NTIS.

At a test-plant located in Sinding-Oere, Denmark, the aim was to mix particles of household food wastes with liquid manures to a suitable consistency. The resulting material was treated for one hour at a temperature of 70 degrees centigrade so that it should not constitute any hazards to health and then subjected to digestion at thermophile process temperatures. A traditional slurry separator was used to sort out undesirable materials such as plastics. Stones, metals etc. were removed by sedimentation in the fore-tank. Although some technical problems arose, the final product was without unwanted materials and had an acceptable heavy metal content and hygienic standard. The amount of unwanted, separated material was only 8% of the total amount of received household wastes. The production of methane was satisfactory when compared with the quality of the wastes, and amounted to ca. 120 cubic meters per ton of wastes. In the fore-tank the sediment of stones, glass etc. was minimum 10%. Some technical alterations are necessary, especially with regard to preliminary processing, and other modifications should be carried out in relation to other processes. The quality of the sorted household wastes should be discussed as garden wastes and inadequate sorting at the sources substantially increases processing costs. (AB).

23206 (ETDE-mf–93795223) **Research into the energetic utilization of biomass.** Thiem, U. Noell GmbH, Wuerzburg (Germany); Ministerium fuer Ernaehrung, Landwirtschaft und Forsten des Landes Niedersachsen, Hannover (Germany). Sep 1990. 178p. (In German). Order Number DE93795223. Source: OSTI; NTIS (US Sales Only).

Within the framework of the study, the use of biomass as a fuel in fluidized bed furnaces was investigated because this combustion system stands out by high flexibility regarding low-grade fuels. As a first step towards the design of a fluidized combustion system, fuel-technological aspects were studied. It was found that the entire plants, which have on average calorific value of 17000 kJ/kg dry substance, can be burnt even if they have a higher water content. The design concept for a power plant with a thermal capacity of 30 megawatts comprises a stationary fluidized bed furnace with external ash recirculation as a robust and flexible combustion system. The hot, ash-laden flue gas is routed via a cyclone. The precipitated ash is fed back into the combustion chamber via a fluidized bed cooler while the flue gas is supplied to the boiler for power and heat generation. Cogeneration is indispensable to ensure optimum energy utilization. Including roads, the plant requires an area of some 6300 m^2. (orig./EF).

23207 (NEI-DK–1171) **Biomass in scattered buildings: Experience gained, status and preparation of demonstration projects.** Dk-Teknik, Soeborg (Denmark); Ramboell, Hannemann og Hoejlund A/S, Copenhagen (Denmark). Apr 1993. 118p. (In Danish). Contract ENS-51161-92.0005. Order Number DE93794756. Source: OSTI; NTIS; INIS.

A survey of experience gained of technological, organisational and economical aspects of earlier Danish projects related to smaller straw and wood-chip fired plants on which the presented recommendations for carrying out new demonstration projects are based. An individual project, based at Langebaek, Denmark, where straw-pellet fuelled plants were installed in various homes is judged as successful although several technical and organisational problems remain to be solved. A project involving wood-fuelled domestic boilers and district heating plant in Kil, Sweden is also evaluated. The current status regarding combustion properties, distribution equipment, storage at the consumers, transport from the storage facility to the boiler, the combustion system and aspects of environmental protection is surveyed. Model calculations are carried out to illustrate the economical aspects of the use of straw and wood chip fuels, and these are evaluated and compared to individual oil-firing of domestic boilers. Ideas for ways of spreading the use of biomass fuels in private homes are presented. It is suggested that related technology and the potential consumer's knowledge of straw and wood fuels is at present limited and that more demonstration projects are needed. Local authorities and firms should be included in these activities and consultancy services should be increased. The assurance of a stable supply of these fuels presents a current problem and transport to, and storage at, the consumer should be better organized. Straw and wood fuels are cheaper to use than oil yet initiating government subsidies will be necessary for the consumer. (AB) (28 refs.).

A THERMIE Programme Action.

Currently there are ten large collective biogas plants and ten smaller farm plants operating in Denmark. During the last five years, biogas technology has undergone extensive technological development. The developmental process is supported by a public R and D programme and a follow-up programme for full-scale demonstration plants. Most plants still need considerable income increases before a final conclusion can be reached as to whether it is possible to achieve a profit from a corporate economic viewpoint. All plants have received investment grants. Gas production is in most cases reliable, especially due to the admixture of easily convertible organic waste as a supplement to the slurry supplies. Profitable collective biogas plants are within reach, even without investment grants. The total intake of biomass must be supplemented by 10 to 25 per cent easily convertible organic waste so that the minimum gas production reaches 30 to 35 m^3 per m^3 of biomass. Plants based solely on animal manure are not profitable.

Energy from the biogas has to be sold at prices corresponding to consumer prices, which include Danish energy taxes. Collective biogas plants in Denmark appear to be approaching a commercial breakthrough. The concept of a collective biogas plant has been developed to address the energy-related, environmentally-related and agricultural problems. (AB).

Potentials for setting up a biomass conversion plant near Skals district heating plant in Denmark are discussed. 19 farms producing a total of 25,700 tons of manure per year would supply the plant in addition to 4,300 tons of other biomass. Four models for the number of plants and transport of biomass were considered. The aim was to reduce the volume of road transport of manures to the plants, to propose plans for the transmission of the methane to Skals district heating plant and to gain information on technological and economical aspects on which decision-making could be based. Possibilities of providing employment for some of the local inhabitants were also considered to be of relevance to the project. The system models are described in detail in addition to the use and possible prices of the methane used in local heat production. Aspects of financing, organization and local administrative procedures are also dealt with. (AB).

A THERMIE Programme Action.

The biological process of anaerobic digestion is used primarily as a tool for waste treatment. It also produces energy in the form of biogas - a feature by which it is often called the biogas technology. This paper outlines special features of this process, together with other advantages and disadvantages of applying the AD or the biogas technology, to satisfy ever increasing regulatory requirements and public concerns over pollution at both global and local levels. The paper then gives suggestions which could be implemented at the Commission, national and regional levels to propagate the implementation of the biogas technology. (au).

A THERMIE Programme Action.

The author, a veterinary surgeon, deals in detail with the occurrence of pathogens in manures, also with regard to their use in biomass conversion plants. Hazards to health, in the form of disease risks, are pointed out in relation to transporting manures from the sources to the conversion plants, processing them for methane production and spreading the by-products out on the fields as fertilizers afterwards. Suggestions are given for safeguards against the dissemination of pathogens in these respects, also in connection with sanitation of organic matter during processing. Tables giving details of pathogens that regularly occur in manures in Denmark, decimation and inactivation times, the influence of various stabilizing treatments in salmonella bacteria and eggs of Taenia sagninata insludge, and hygienic conditions for the use of waste as stipulated by the Danish Ministry of the Environment, are presented. Discussions were given on effects of average pore radius in supports and total pore volume on catalyst activity and product distribution in an FT reaction characteristics of iron catalysts using activated carbon as the support of which high dispersion loading is expected. Iron carbonyl or iron nitrate was impregnated and loaded in three kinds of activated carbon supports. The reaction was carried out using a fixed bed flow reactor under a time factor (W/F) of 20 g-h/mol, a temperature of 553 K, a pressure of 15 kg/cm^2 and H2/CO = 1.5. Catalysts using activated carbon with medium pore radius and volume resulted in an identical CO conversion rate and product distribution either in iron carbonyl or iron nitrate loaded catalyst. Comparing three kinds of supports of iron carbonyl metal origin, recognized is no correlation with sulfur residue or specific surface area of the catalyst with respect to the CO conversion rate and the hydrocarbon yield, but noticeable increase is observed with increasing pore radius and volume. 3 refs., 2 tabs.

Source: OSTI; NTIS; GPO Dep.

A continuous stirred tank reactor with and without sulfur recovery has been operated using Chlorobium thiosulfatophilum for the conversion of H_2S to elemental sulfur. In operating the reactor system with sulfur recovery, a gas retention time of 40 min was required to obtain a 100 percent conversion of H_2S to elemental sulfur. Essentially no SO_4^{2-}, an undesirable product, was produced under these conditions. Significant reductions in the gas retention time are expected by employing cell recycle after sulfur recovery, and by using increased pressure.

Contract FG22-89PC89786. Order Number DE93014951. Source: OSTI; NTIS; GPO Dep.

A bench-scale reactor is being used to conduct studies of the conversion of synthesis gas to methanol in the liquid phase by a novel process. In previous reports, we provided evidence for a two step reaction in series, the carbonylation reaction mainly taking place close to the copper chromate surface, and the hydrogenolysis reaction taking place on the surface of the copper chromate. The interaction between thetwo catalysts enhances the rate of MeOH formation. we have previously shown that under present operating conditions, the methyl formate concentration is not in equilibrium. The presence of H_2O results in a drop in the rate of MeF generation by the carbonylation reaction. In this quarter, we examined schemes to reduce the H_2O level in the reactor and enhance the rate of MeF formation. An increased methyl formate concentration would lead to increased methanol synthesis rates.

23215 (DOE/PC/90043–T8) **Novel approaches to the production of higher alcohols from synthesis gas: Quarterly Technical progress report No. 8, July 1, 1992–September 30, 1992.** Roberts, G.; Kow, S. North Carolina State Univ., Raleigh, NC (United States). Dept. of Chemical Engineering. 14 Apr 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90043. Order Number DE93014952. Source: OSTI; NTIS; GPO Dep.

A detailed technical plan for research on higher-alcohol synthesis in a slurry reactor was prepared and approved internally, as part of the University's requirements for the doctoral degree. The focus of this plan is the high-pressure methanol synthesis catalyst, and modifications thereof. A major challenge of the research will be to identify a slurry medium that is stable at the typical operating temperature ofthis catalyst, i.e., about 400°C. Two shakedown runs were made in the stirred autoclave without catalyst in order to check the mechanical operation of the system and to test some of the analytical equipment. Further preparation, characterization and screening of higher-oxygenate synthesis catalysts based on rhodium were carried out. The catalyst compositions tested during the period were: Rh/Al_2O_3, $Rh/Nb/Al_2O_3$, $Mo/Rh/Al_2O_3$ and $W/Rh/Al_2O_3$. All catalysts contained a nominal 1 wt. % Rh. $Rh/Nb/Al_2O_3$ and $Rh/Mo/Al_2O_3$ were about twice as active for COconversion as the other catalysts. However, oxygenate yields were disappointing for all of the compositions tested. The $Rh/Mo/Al_2O_3$ catalyst had the highest carbon efficiency to oxygenates, 33%.

23216 (NREL/TP–421-5150) **Status and future opportunities for conversion of synthesis gas to liquid energy fuels: Final report.** Mills, G. (Delaware Univ., Newark, DE (United States). Center for Catalytic Science and Technology). National Renewable Energy Lab., Golden, CO (United States); Delaware Univ., Newark, DE (United States). Center for Catalytic Science and Technology. May 1993. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010025. Source: OSTI; NTIS; GPO Dep.

The manufacture of liquid energy fuels from syngas (a mixture of H_2 and CO, usually containing CO_2) is of growing importance and enormous potential because: (1) Abundant US supplies of coal, gas, and biomass can be used to provide the needed syngas. (2) The liquid fuels produced, oxygenates or hydrocarbons, can help lessen environmental pollution. Indeed, oxygenates are required to a significant extent by the Clean Air Act Amendments (CAAA) of 1990. (3) Such liquid synfuels make possible high engine efficiencies because they have high octane or cetane ratings. (4) There is new, significantly improved technology for converting syngas to liquid fuels and promising opportunities for further improvements. This is the subject of this report. The purpose of this report is to provide an account and evaluative assessment of advances in the technology for producing liquid energy fuels from syngas and to suggest opportunities for future research deemed promising for practical processes. Much of the improved technology for selective synthesis of desired fuels from syngas has resulted from advances in catalytic chemistry. However, novel process engineering has been particularly important recently, utilizing known catalysts in new configurations to create new catalytic processes. This report is an update of the 1988 study Catalysts for Fuels from Syngas: New Directions for Research (Mills 1988), which is included as Appendix A. Technology for manufacture of syngas is not part of this study. The manufacture of liquid synfuels is capital intensive. Thus, in evaluating advances in fuels technology, focus is on the potential for improved economics, particularly on lowering plant investment costs. A second important criteria is the potential for environmental benefits. The discussion is concerned with two types of hydrocarbon fuels and three types of oxygenate fuels that can be synthesized from syngas. Seven alternative reaction pathways are involved.

1301 Resources and Availability

23217 (DOE/BP–1909) **Modeling the system: How computers are used in Columbia River planning.** USDOE Bonneville Power Administration, Portland, OR (United States); Corps of Engineers, Portland, OR (United States). North Pacific Div.; Bureau of Reclamation, Boise, ID (United States). Pacific Northwest Region. Oct 1992. 44p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93011649. Source: OSTI; NTIS; GPO Dep.

This publication describes the three computer models Federal agencies and the Northwest Power Pool use regularly to help plan hydro operations in the Columbia River Basin: HYSSR, HYDROSIM, and HYDREG. It is one of a series of booklets written for participants in the System Operation Review (SOR) being conducted jointly by the US Army Corps of Engineers (Corps), the US Bureau of Reclamation (Reclamation), and theBonneville Power Administration (BPA). A list of the other publications appears on the inside front cover. The SOR is the environmental analysis required to consider changes in Columbia River system operations related contract arrangements. Over the next few years, the agencies will develop a new multiple-use operation for the Columbia River. At the time, the Pacific Northwest Coordination Agreement (PNCA) and other contracts related to the Columbia River Treaty between the United States and Canada will be renegotiated and renewed. Many alternative ways of operating individual projects and the river system as a whole will be considered in the SOR. To analyze how these changes would affect the system's ability to meet its multiple-use goals, various operating scenarios will be thoroughly evaluated. The three computer models, HYSSR, HYDROSIM, and HYDREG, will play an important role in this evaluation.

23218 (LA-SUB–93-128) **Remote sensing, image processing and GIS training and technical assistance for Commission Ejecutiva Hidroelectrica Del Rio Lempa (CEL), San Salvador, El Salvador.** Martin, T.C. (Computer Assisted Development, Inc., Fort Collins, CO (United States)). Los Alamos National Lab., NM (United States); Computer Assisted Development, Inc., Fort Collins, CO (United States). 25 Oct 1988. 14p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93010816. Source: OSTI; NTIS; GPO Dep.

The Commission Ejecutiva Hidroelectrica Del Rio Lempa (CEL) has purchased an ERDAS image processing and GIS system which has been installed at CEL facilities in San Salvador. The objective of CEL is to develop the technical capability and expertise for successful use of computer-based image processing and analysis by geographic information system (GIS). Apparently, El Salvador currently does not have this technology and CEL is committed to taking the lead in its development. The objectives of the professional development workshop were to: provide instruction in the background and principles of remote sensing and raster-based GIS; expose the participants to applications of interest; provide hands-on experience using all modules of the ERDAS system; explore with participants and US experts approaches to projects anticipated to use the ERDAS system. The workshop took place at CADI in Fort Collins during October 3–14, 1988. There were five participants from CEL with expertise in the following areas: soil science and watershed management, geology, computer science/

information management, hydrology, civil engineering and statistics.

23219 (VYH-MON–300E) **The observations of the Finnish river ice research project.** Huokuna, M. (ed.). National Board of Waters and Environment, Helsinki (Finland). 1991. 52p. Order Number DE93794805. Source: OSTI; NTIS.

Within the years 1985-1989 a numerical one-dimensional river flow model for winter conditions was developed. The field observations needed for development and calibration of the model have been carried out in four river stretches. In the publication there is a list of the contents of the different files and the description of the format how the data is arranged.

23220 (CONF-930870–1) **Spatial simulation of smallmouth bass in streams.** Jager, H.I. (Oak Ridge National Lab., TN (United States)); Schmoyer, D.D.; Sale, M.J.; Van Winkle, W.; DeAngelis, D.L.; Sabo, M.J. Oak Ridge National Lab., TN (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. Contract RP2932-2. From Waterpower '93; Nashville, TN (United States); 10-13 Aug 1993. Order Number DE93008578. Source: OSTI; NTIS; INIS; GPO Dep.

The hydropower industry and its regulators are hampered by the inability to predict the relationship between alternative flow regimes and fish population response. We have developed a spatially explicit, individual-based model of populations of small-mouth bass in streams as part of the Compensatory Mechanisms in Fish Populations Program (see Sale and Otto 1991). In the model, the profitability of alternative stream locations varies in response to habitat depth and velocity through changes in the frequency of prey encounters and the metabolic costs experienced by fish. We conducted an evaluation of our hydraulic simulation at the scale of individual stream cells. The potential error in predictions for individual cell velocities suggests that larger-scale model predictions for the representative reach are most appropriate. At this scale, the model appears to produce realistic patterns in the growth and dispersal of young-of-year small-mouth bass. This verification step allows us to proceed with greater confidence in evaluating the original question of how small-mouth bass populations respond to alternative flow regimes.

14 SOLAR ENERGY

23221 (CONF-921276–, pp. 13-16) **Past and present of research and development of solar energy and the problems.** Noguchi, T. (Japan Machinery and Metals Inspection Institute, Tokyo (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

A description is given of the progress of solar energy R and D and evaluation of a relationship between global environmental conservation and solar energy development. It was not until the 1st International Solar Energy Congress held in 1955 that the fundamental modern science/technology was introduced into the field of solar energy utilization. In 1973 the first oil crisis happened, and since 1974 development of petroleum substitution energy has been promoted worldwide and under the governmental leadership, and technology of solar energy utilization has also made a rapid advance. The solar cooling and heating/hot water supply system technology has already passed the stage of practical use and entered into the stage of commercialization, but the cost of the system is still higher than that by fossil fuels. Spread use and promotion of the technology is supported by reduction and exemption of taxes, the subsidy system and the low interest loan system. In the technology field of relatively low temperatures below 200°C such as the solar cooling and heating/hot water supply system, the industrial use solar system, etc., cited as the subjects are cost reduction, development of high-performance equipment/materials, and environmental harmony and architecture design. 3 refs., 1 fig.

1401 Resources and Availability

23222 (CONF-921276–, pp. 279-282) **Simple recording film for measurement of global solar tediation. 4.: Wavelength dependency and fading on slopes.** Sawamoto, H. (Chiba Univ., Chiba (Japan). Remote Sencing and Image Research Center); Yoshimura, T.; Ishikawa, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

The global solar radiation measurement use simple recording film to which the electric power supply is not needed is low in cost and light in weight. Measurements which can be made by that film are simultaneous measurement at numerous spots in the wide area, small area measurement for the botanical leaf and other surfaces, and solar radiation measurement with a long term recording. Dependency on wavelength having been investigated by using several types of sharp-cut filter, their utilization was further studied for the solar radiation measurement on the slope. That film is a film which is based on photography use triacetylcellulose and impregnated with azo pigment (Oil Red-O). The solar radiation is measured by calculating the fading ratio of pigment from the absorptance ratio before and after the exposure at the maximum absorption wavelength of pigment. The fading ratio of Oil Red-O film exponentially decreases against the increasing in solar radiation. The fading coefficient changed with changing in absorptance on a wavelength-by-wavelength basis of pigment so that a dependency was observed on wavelength. However, the different types of filter used for the experiment differ from one another in transmittance of transmitting portion. Therefore, a strict study is needed in conformity with its influence. Solar radiation on the slop was also measured by giving a tilt angle of 15, 30 and 45°, respectively to the horizontal surface. The utilization of global solar radiation measurement use simple recording film was known to be effective for the solar radiation measurement on the slop. 3 refs., 8 figs., 1 tab.

23223 (CONF-921276–, pp. 283-286) **Study on mapping of albedo by using images from meteological satellite.** Otani, K. (Tokyo University of Agriculture and Technology, Tokyo (Japan)); Iizumi, H.; Horigome, T.; Kurokawa, K.; Tsuda, I. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Albedo on the ground surface is raised as a problem for the estimation of solar irradiation by the cloud image conveyed from the meteorological satellite. In order to make the estimation with a high accuracy, the cloud image albedo was studied at 18 representative spots in Japan aiming at preparation of albedo map. The albedo observed from the meteorological satellite is classified into three types by pixel, i.e., cloud, atmosphere and ground pixels. The total of atmosphere and ground pixels under the bright sky without cloud is particularly called bright sky albedo. In the histogram method, the bright sky albedo is the minimum of the 16-gradation image element values in histogram. As the histogram is fluctuant by time of image observation, the zenithal time albedo exponent (Rs) which does not depend on the solar position at the time of observation was obtained by zenithally correcting the image data with a least square method to convert the reflectance. The albedo is $R_s \cos Z_{pn}$ where Zpn is an arbitrary zenithal angle. The lowest value of Rs is the bright sky albedo. Outputting from the satellite image could be made of ground albedo which included the reflection in atmosphere under the bright sky. Thus obtained albedo percentages were 3 to 5, 6 to 12 and 15 to 35 on the sea, soil and snow-covered pixels, respectively for the year. The seasonal fluctuation in bright sky albedo is intense in the region having numerous days of snowfall. 5 refs., 3 figs., 2 tabs.

23224 (CONF-921276–, pp. 287-290) **Irradiation estimation by using meteorological satellite images.** Iizumi, H. (Tokyo University of Agriculture and Technology, Tokyo (Japan)); Otani, K.; Horigome, T.; Kurokawa, K.; Tsuda, I. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Study was made of daily recording solar irradiation estimation method in which cloud image data obtained from the meteorological satellite are processed with a few regional errors. Selection as a representative was made of 18 spots at which the satellite image could be used. Though in the conventional data recording method, the daily recording was done from the product of irradiation hours multiplied by the mean image element value during the said day, the estimation was newly done by a Simpson's integration setting the sunrise and sunset hours as zero. In the present estimated value recording method, the data obtainment duration were switched from conventional 0900-to-1500 hours to sunrise-to-sunset hours. Estimation accuracy was heightened, which heightening was considerable particularly in the estimated value recording method. Whichever might be the method, three models (the 1st, 2nd and 3rd formulae) of formulation were used for estimating the irradiation. Coefficients were determined by least square method from the data obtained at the 18 spots. Irradiation data done at all 64 spots were similarly processed. Estimation errors were verified upon comparison between both estimated and actually measured values. Among all the estimation formulae, the 1st one which was by the data recording method excelled in regional error as well as estimation on both all spots and spot-by-spot bases, and gave a high fidelity irradiation distribution map which was 0.126 to 0.230 in root-mean-square estimation error. 5 refs., 4 figs., 3 tabs.

23225 (NEI-DK–1147) **Solar heating systems. Part 1: Quantitative section.** Vilstrup Research A/S, Copenhagen (Denmark). Jan 1993. 128p. (In Danish). ENS-51181-93.0007. Order Number DE93794684. Source: OSTI; NTIS; INIS.

Results of a survey, undertaken by a Danish specialist firm, concerning solar heating systems. The main aim of the analysis was to build up a basis for the choice of a strategy for a campaign for marketing these systems. The survey was founded on telephone interviews with ca. 500 house-owners located throughout the country. Questions posed related to the individuals' current mode of space heating and future wishes in this respect, the amount of acquired information on the subject and the nature of considerations regarding acquisition, the level of information acquired and the choice of information sources, the amount of realistic information on prices, possible subsidies and oil savings related to the supplementary use of solar energy, the name of the relevant commercial supplier and attitudes to a number of aspects connected with the solar heating systems. The results are presented by means of a short explanatory text and a large volume of data. Generally speaking, it is concluded that most people in Denmark are reasonably well-informed on solar heating systems, and that they take environmental considerations seriously. Differences of opinion were related to the fact that some felt that the system itself, placed on roofs, was ugly and could perhaps appear pretentious. Only 5% of the interviewed persons had actually been in contact with an installator, although the majority had a positive attitude towards solar heating systems. (AB).

23226 (NEI-DK–1148) **Solar heating systems: Qualitative investigation of the attitudes of "owners" and "waverers".** Vilstrup Research A/S, Copenhagen (Denmark). 1993. 27p. (In Danish). Contract ENS-51181-93.0007. Order Number DE93794685. Source: OSTI; NTIS; INIS.

This report is based on a previous, related, one which was quantitative in character and relied on 500 telephone interviews with house-owners. The aim of this, following, report was to carry out a more deep-going, qualitative analysis focussed on persons who already own a solar heating system (purchased during 1992) or were/are considering having one installed. Aspects studied were the attitudes, behaviour and plans of these two groups with regard to solar heating systems. Some of the key questions asked concerned general attitudes to energy supply, advantages and disadvantages of using solar heating systems, related decision-making factors, installation problems, positive and negative expectations, evaluation of the information situation, suggestions related to information systems regarding themes etc., dissemination of information, sources of advice and information, economical considerations, satisfaction with the currently-owned system which would lead to the installation of another one in connection with the purchase of a new house. The results of this investigation directed at Danish house-owners are presented and discussed, and proposals for following activities within the marketing situation are given. It is concluded that the basic attitude in both groups strongly supports environmental protection, renewable energy sources and is influenced by considerations of prestige and independence. Constraint factors are confusion about environmental factors, insecurity in relation to the effect of established supplementary energy supply and suspicion with regard to the integrity of information received. (AB).

The proceedings of the conference include the results of research and development of the photovoltaic power generation system, the wind power generation and biomass. As for the photovoltaic power generation system, reports are made on the following: power generation efficiency of the system, output characteristics of solar cell module, interconnected power system, optical properties of solar cells, solar cell array, development of intermittent flow redox batteries to be used for the photovoltaic power generation system. As to solar radiation utilization, studies on the following are made public: an optical/thermal hybrid heat collector which is designed to obtain light and heat at the same time using a solar cell as a heat collecting board, solar car, a silica gel layer used in a solar thermal utilization direct regenerating type adsorption tank, a solar greenhouse, a solar refrigerating system, solar pond, a solar energy ground thermal storage system, a solar-cell blade wind turbine as a composite system, photovoltaic-thermo composite pannels, solar house, passive solar heating. A small wind turbine generation system for mountanious regions is described. As biomass, production of tall-golden-rod is reported.

23228 (CONF-921276–, pp. 5-6) **Status of new energy development by Kansai Electric Power Company.** Yamaoka, R. (The Kansai Electric Power Co. Inc., Osaka (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Explanation was made of trials conducted by Kansai Electric Power Company for the photovoltaic, fuel cell, wind power and other power generations. Participating in the Sunshine Project, the Company installed 100 units of a 2kW flat plate type photovoltaic power generation system and 100 domestic use loaders in the Rokko New Energy Center. They have been tested for demonstration since March, 1987. Also within its business province, the Company installed an approx. 1kW system in FY 1991 and 10kW systems at nine different places in FY 1992, and they are being all tested for demonstration. As for the fuel cell system, a 1000kW phosphoric acid fuel cell was tested for demonstration in 1987 and

1988. A 5MW power generation plant presently under construction is scheduled to be tested for demonstration from 1993 through 1996. Both 100kW molten carbonate fuel cell and 25kW solid electrolyte fuel cell are presently under development cooperatively with manufacturers. As for the wind power generation, 5kW propeller type system and 5kW Darrieus type system are being both tested for the demonstration of wind power generation in cold and snow-falling regions. Demonstration research is being also made on the ocean wave energy conversion and solar house.

23229 (CONF-921276–, pp. 7-12) **System interconnection photovoltaic power generation system which assumes the existence of power counterflow for the first time in the actual living house.** Kuwano, Y. (Sanyo Electric Co. Ltd., Osaka (Japan)); Takeoka, A.; Hazaguchi, E.; Waki, M.; Ishida, T.; Makino, Y. 3 Dec 1992. 305p. (In Japanese). In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Completion for the first time in Japan was made of system in which the power generated by the solar cell panel on the roof of private house is not only consumed for the domestic use in the house but also its surplus is sold to the electric power company. Then, interconnecting operation was started. The general aspect of that system was explained in the present report. No longer requiring the necessity of storing the surplus power in the battery as conventionally done in parts, the method assuming the existence of power counterflow can constitute a rational system in which the power generated in the house during the daytime is normally so excessive as to serve for controlling the daytime peak power by being sent back to the electric power company, while the living during the nighttime is made by the power supplied by the electric power company. That system is composed of solar cell panel, inverter and wattmeter. Its number of solar cell modules is 43 in total for both amorphous silicon and polycrystal silicon types. Its output power is approx. 1.4kW. During one month, the solar cell generated power mounting up to about 100kWh and its about 40% was sold. 3kW photovoltaic power generation system for the domestic use will be widely used at a price of 1 to 2 millions yen per system around 2000. 8 figs., 2 tabs.

23230 (CONF-921276–, pp. 17-22) **Photovoltaic power generation.: Its recent progress and new role in the global environmental problems.** Hamakawa, Y. (Osaka University, Osaka (Japan). Faculty of Engineering Science). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. The photovoltaic power generation technology is described in terms of its characteristics, results of R and D for high efficiency and cost reduction, economic forecasts including electric power application. Such conversion efficiency is indicated experimentally as 20% for single crystalline silicon, 16% for polycrystalline silicon, and 23% for GaAs. Stack solar cells aiming at low cost and high efficiency are proposed, and research and development using materials in various combinations have been progressing such as a-Si/a-Si, a-SiC/a-Si, a-Si/a-SiGe, a-Si/poly-Si, a-Si/CIS, etc. However, as to crystalline Si and GaAs crystalline solar cells, about 80% of their theoretical critical efficiency have already been achieved. As examples of large-scale integrated power generation, Shikoku Electric Power's 1MW plant in Japan and a 7.2MW plant in the U.S. are now in operation. In these 10 years a module cost has become 280 yen/W, which is thought to be profitable as commercial electric power. 12 refs., 6 figs., 3 tabs.

23231 (CONF-921276–, pp. 23-26) **Measurements and analysis of influence factor and efficiency of PV system. Part 1.: Summary of measurement system and results in summer.** Kozuma, S. (Sanyo Electric Co. Ltd., Osaka (Japan)); Ishihara, O.; Hiyama, T. 3 Dec 1992. 305p. (In Japanese). In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

The paper introduces an outline of a measuring system for the photovoltaic power generation system set on the rooftop of one of the buildings in the campus of Kumamoto University and makes a consideration of the results of measurements in summer. Amorphous silicon (21.0W) and polycrystalline silicon (45.0W) solar cells for electric power use are used here, the use of which is expected for the future in the light of a production cost and power generation efficiency. One solar cell module is set at an azimuth of 0° (exactly south), and the other is set on a solar azimuth automatic tracking turn table. On fine days during the measurements, variations in efficiency of daily module gross generation due to difference in measuring day are larger in polycrystalline solar cells than in amorphous ones, and the efficiency tends to increase as the day passes. Variations in module inside temperature are most affected by an incident solar radiation amount and next by wind velocity. By the multiple regression method including an outside air temperature, it is possible to measure the module inside temperature with satisfactory accuracy. 1 ref., 6 figs., 2 tabs.

23232 (CONF-921276–, pp. 27-30) **Characteristics of PV module output considered the environmental factors.** Kobayashi, M. (Science University of Tokyo, Tokyo (Japan)); Tani, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. For the optimal design of the photovoltaic power generation system, solar cell modules are modeled to analyze a relationship between environmental factors and cell temperature of the solar cell. With the measuring data, validity of the analysis is shown. Next, a relationship between seasonal variations of spectral distribution of solar radiation and output of the solar cell module is clarified and considered. Further, annual power generation is calculated using the above-mentioned analytical results. The analytical and measuring results show that there is a linear relationship between intensity of solar radiation and the cell temperature, and with regard to wind velocity, a marked cooling effect of the module is observed at wind velocity below 3m/s. Using K, a value corresponding to conversion efficiency of the solar cell module, obtained is monthly conversion efficiency and K value. As a result, a correlation clearly exists between the both as to amorphous solar cell modules and the conversion efficiency fluctuates 25% at highest. As to polycrystalline solar cell modules, the values which are relatively near to the measuring values are obtained by applying the cell temperature. 6 refs., 8 figs., 3 tabs.

23233 (CONF-921276–, pp. 31-34) **Photovoltaic generating system of EMH (Energy Management House).** Rikihisa, K. (Kyushu Electric Power Co. Inc., Fukuoka (Japan)); Fujii, K.; Yamasaki, K.; Hachimure, M.; Fukuda, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

An EMH is a wide-spread type energy saving house aiming at both energy conservation and amenity of the residential environment. This paper reports a status of power generation of the photovoltaic generation system installed in the EMH. The output of solar cells is divided into two systems: one system connects 204Wp from the cells set on the south side to a ventilating fan as they are in direct current. The other connects the remaining 1836Wp to a heat pump air conditioning and water heater by controlling the maximum output and converting them to an alternating current with invertor. A family (a couple and two children) lived as monitors in an EMH for a week. As a result, the family's mean electric power consumption per day was approximately 44kW (including the electric water heater). In this case, it is found that in the system of a scale of the EMH, about 10% of the electric power consumption in summer can be provided by solar cells. At the same time there appeared the problem that the cell temperature rose to 66°C

on the days with high solar radiation, which caused reduction in conversion efficiency of nearly 2%. 1 ref., 11 figs., 1 tab.

23234 (CONF-921276–, pp. 35-38) **Reasonable method for the use of P.V. systems from the international viewpoint.** Anno, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. To widely spread the photovoltaic power generation, studied is a policy for implementing measures for price reduction by a mass production effect. Basically, an implementing plan for wide spread is worked out, and reducing prices to be brought by increasing production under the plan are calculated. Then, the annual amount of money required to carry out the plan is calculated. As a long-term plan for the wide spread, in a ten-year plan, a base for a 3kW system is established by 100 each a year. This pace continues for ten years. Annual cost is several hundred million yen, and the price of a solar cell which is presently 460-585 yen/W will be 60-230 yen/W in 10 years. Further, for 40 years from the 11th year to the 50th year of the long-term plan, equipment output will reach 200 million kW and the price of a solar cell will be 14-120 yen/W (Program D). Assuming that annual domestic electric power consumption is 650 billion kW and will be 1.6 times 40 years later, Project D can provide 16% of the consumption. As a development plan, energy conservation by a DC method should be attempted. It is necessary to make good use of the characteristic that the photovoltaic power generation is fit for peak cut power generating. 6 refs., 1 tab.

23235 (CONF-921276–, pp. 39-42) **Development of compact protective control unit for grid connected small residential systems.** Takigawa, K. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Kobayashi, H. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Together with showing that it is comparatively profitable to outfit a compact protective control unit for the grid connected small residential system, the present paper explained the experimental production result of a protective control unit for the grid connection assuming the existence of power counterflow. Basic functions required for protecting the grid connection are function of interrupting the accident current by detecting the excess current, earthing current, etc. and stopping/paralleling the consumer's unit off, function of stopping/paralleling the consumer's system off by detecting the anomaly in voltage, frequency, etc., function of stopping/paralleling the consumer's system off by detecting the reverse charging operation, etc., and function of protecting the consumer's system from the lightning surge, etc. By taking all the above functions into consideration, a compact protective control unit to be outfitted for the grid connection was experimentally produced for the use of small residential system assuming the existence of power counterflow. That unit is endowed with functions of generally protecting the system, preventing the reverse charging, automatically diagnosing the trouble and displaying the service. Its basic performance has been so far confirmed. The method applied to the present unit for preventing the reverse charging results from the research entrusted by the NEDO. 2 figs., 3 tabs.

23236 (CONF-921276–, pp. 43-46) **Demonstration research on islanding preventing methods for small scale PV systems.** Kobayashi, H. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Kitamura, A. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Demonstrative evaluation is made on methods for preventing reverse charging operation of a small scale photovoltaic power system of an interconnected power system type with an output of about several kW. The reverse charging operation method is divided into a passive one and an active one. The paper evaluates a frequency bias method and an effective power fluctuation method among the active method, through demonstration tests conducted at Rokko Island test facilities. For the active method, the condition required is that in addition to stopping the PV system rapidly and surely at reverse charging operation, frequency, fluctuation values of output power or fluctuation setting values should not affect voltage fluctuation and stability of a distribution line more than a necessity and a minimum, at a steady time. The frequency bias method is for a current-control inverter use and the main body is a phase lock oscillator which is given frequency bias. This oscillator is serially connected with the interconnected point voltage signal inputting the inverter. In the effective power fluctuation method, the inverter is equipped with effective power fluctuating function. Validity of both methods is verified. 2 refs., 5 figs., 1 tab.

23237 (CONF-921276–, pp. 47-50) **Performance test and evaluation of small scale PCSs and batteries for PV application.** Takigawa, K. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Kobayashi, H. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

As entrusted by the NEDO, the present research was made on the tested performance of small scale power conversion system (PCS) for the photovoltaic (PV) application. Battery-testing facilities comprise three systems. Each of those systems is composed of battery-charging/discharging control circuit, individual monitory control circuit and individual testing bed. Charging/discharging can be tested up to 12V and 500A in voltage and intensity of current, respectively by the facilities. Besides different short term basic characteristic tests, conducted were over-charge/discharge withstanding test, PSOC cycle test and acceleration life test. The PCS test facilities are composed of power source unit to simulate the solar cell array, commercial power source unit, wiring unit and loading unit which are all for the simulation use, and trouble-generating unit. The PCS's performance can be tested for both independent power source use and system interconnection use up to 10kW in rated output. The lead battery developed by the NEDO for the PV application is sufficiently promising with a life of about ten years. The small scale PCS of domestic product installed in the Rokko Island bears comparison with that of foreign product in test result. 5 figs., 4 tabs.

23238 (CONF-921276–, pp. 51-54) **Optical properties of solar cells using the static concentrator.** Yoshioka, K. (Tokyo University of Agriculture and Technology, Tokyo (Japan)); Liew, L.; Suzuki, A.; Kobayashi, M.; Saito, T.; Kobayashi, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Solar cells were experimentally manufactured with the use of static concentrator and their properties were measured as condensing module. Using acrylic resin, the condensing lenses were made able to condense the incidence system within 3O° without following it. The used solar cell was of monocrystalline silicon type and its surface area was 4cm^2. When the angle of sunlight incidence was 0 to 20°, the short circuit current with the condensing lenses was known to be about 1.5 times as strong as that without them. When the above angle was equally 0 to 20°, there was no change in I-V properties. However, when that angle became larger than 25°, the above current with the above lenses started to weaken, and when it became 40°, the weakening in it was found much larger than that without them. The conversion efficiency with them is always lower than that without them. It is judged attributable to the light reflection on the lens surface and light absorption by the lens material. The optical efficiency was kept as stable as 1.65 in value. It was confirmed that the condensing lenses as a static concentrator can be designed to aim at the condensation of sunlight. 2 refs., 6 figs.

23239 (CONF-921276–, pp. 55-58) **New design of non-imaging refractive concentrator and its optical characteristics.** Kobayashi, M. (Tokyo University of Agriculture and Technology,

Tokyo (Japan). Faculty of Technology); Suzuki, A.; Kobayashi, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

A low magnification concentrator was designed to be statically used as a premise for the solar cell module in order to lower the cost for the solar cells. Then, its optical characteristics were investigated. The concentration was made firstly for the reason that the concentration by a low cost optical system having a wide opening area can narrow the required area of high cost photovoltaic converter. The second reason was that the strengthening in intensity of radiant ray incident in the photovoltaic converter generally heightens the efficiency in the conversion process or grade of the conversion energy. Lenses were designed under the condition that the light passage length was constant. Those lenses are of two-dimensional concentration having a focus which is linear. Materially made of acrylic resin, they were designed to be 1.49 in refractive index against 900nm which is the peak value of sensitivity of crystalline silicon solar cell. As a result of calculating the lens characteristics by a ray tracing method, it was confirmed that all light within the permissible angle range of incidence can be concentrated into the concentration range. 3 refs., 3 figs.

23240 (CONF-921276–, pp. 59-62) **Steady and unsteady characteristics of photovoltaic array exposed to natural environment.** Nawata, Y. (Yatsushiro National College of Technology, Kumamoto (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

The characteristics of power generated by the solar cells were obtained under the condition of natural environment from a long term measurement through experiment on the system interconnection type photovoltaic power generation system. Dependency of solar cell temperature on the quantity of solar radiation, atmospheric temperature and wind velocity was elucidated through experiment together with showing a method to analytically obtain the temperature of solar cells from their thermal balance. Their unsteady output characteristics were also studied in case of taking their thermal capacity into consideration. Totally $24 \times 0.44 m^2$ modules were used to form polycrystalline silicon type solar cells. Even against the same quantity of solar radiation of $600 W/m^2$, the solar cell conversion efficiency is 14% and 9% at 30 centigrade and 60 centigrade, respectively in cell temperature with a considerable difference between both. In order to calculate the power generated by the array, a polyregression formula was obtained through multivariate analysis by expressing the solar cell temperature as a function of six variables, i.e., quantity of solar radiation, atmospheric temperature, wind velocity and their respective products. In case of calculating the output of solar cells during a certain term, a sufficient accuracy can be obtained even by presuming a steady state with neglecting their thermal capacity. 4 refs., 9 figs., 1 tab.

23241 (CONF-921276–, pp. 63-66) **Analysis on performance of PV-array I-V curve tracer by the capacitive load method.** Kawai, H. (Tokyo University of Agriculture and Technology, Tokyo (Japan)); Horigome, T.; Kurokawa, K. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Relation was numerically analyzed between the sampling time interval and calculating error in the I-V curve measurement unit by capacitive load method for measuring the output characteristics of photovoltaic power generation. The capacitive load method excels the conventional one in large capacity measurement. However, the curve to be measured changes with external factors so that careful measures must be taken. The short circuit current, release voltage and highest output operating point (P) all of which are basic parmeters for the output characteristics were approximatively calculated from the measured curve. Though the holding current and lowering in forward voltage of thyristor must be compensated, the external series resistance loss is judged normally negligible from the standpoint of error analysis. The sampling time interval considerably influences the calculative determination of P. It was made clear that the application of Lagrange's three-dimensional approximation excels in approximate calculation which can control the necessary capacity of condenser. Consequently, it became possible to determine the capacity. 3 refs., 9 figs., 1 tab.

23242 (CONF-921276–, pp. 67-70) **Maximum-power-point control of photovoltaic at high frequency switching.** Tokuda, K. (Doshisha University, Kyoto (Japan)); Harada, K.; Ishihara, Y.; Todaka, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

In order to prevent hysteresis in the maximum-power-point control for the photovoltaic, study was made of a method in which the maximum-power-point is detected/controlled by controlling the fluctuation in both voltage and current of photovoltaic within the switching period, and then, fluctuating both of them by duty ratio at a comparatively low frequency. When they are fluctuated within the vicinity of maximum-power-point at a low frequency, the duty ratio is controlled by setting an appropriate offset on a period-by-period basis against the fluctuation in duty ratio. Thus, the maximum-point can be detected as the photovoltaic power characteristics are stabilized without plotting hysteresis even at a high frequency switching. A CuK converter was used as a DC-to-DC converter. As a result, it could be confirmed from the observed waveform and its Lissajous's figure that the fluctuation in photovoltaic power is small and that the power characteristics do not plot hysteresis. Both maximum power and voltage which were theoretically obtained from the quantity of solar radiation and atmospheric temperature agreed well with both of them which were actually measured. 8 refs., 6 figs.

23243 (CONF-921276–, pp. 71-74) **Control method against the long period deterioration of the solar cell.** Itsumi, J. (Kumamoto Institute of Technology, Kumamoto (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

In order to control the initial deterioration in amorphous solar cell, a method to control the long period deterioration was studied based on the effect of heat treatment directly from the exterior. One time of treatment of the deterioration by annealing at temperatures of 100 to 120 centigrade by a condensing/heating unit was found effective to some extent for stopping the progress of optical deterioration. However, the recovery effect is weakened by long-time optical irradiation. Therefore, effective control of the deterioration is repeated annealing, for which the annealing period (τ) is an important parameter. As a result of annealing directly from the exterior the solar cell which has been exposed to the optical irradiation for five years, the generated power output which had been lowered down to 50% could be recovered up to 72%. The annealing, if made every constant period (τ), could give a possibility of heightening the recovery ratio of solar cell and lengthening the durability of a deterioration control effect. 9 refs., 2 figs., 2 tabs.

23244 (CONF-921276–, pp. 75-78) **Evaluation of photovoltaic modules considered spectral solar radiation.** Hirata, Y. (Science University of Tokyo, Tokyo (Japan)); Tani, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

The paper discusses a method to obtain annual output of solar cell modules (SM) using measuring data on intensity of solar radiation including annual spectral distribution of solar radiation and basic SM characteristics. A spectral method is proposed to obtain output of various SM from intensity of solar radiation measured by

spectropyrheliometer and basic characteristics of polycrystalline and amorphous silicon SM such as spectral response characteristic which are measured by solar simulator. A comparison is made between results of calculation by this method and results of measurement of solar cell modules installed on the rooftop of the campus building of Science University of Tokyo. As a result, solar spectra are found to have an effect on the output of polycrystalline silicon and amorphous silicon solar cell modules. In comparison of the output integrating amount with the conventional method, there is seen little difference in polycrystalline silicon SM. In amorphous silicon SM, a change of monthly output in the spectral method is close to the measuring values and is found to be affected strongly by solar spectra. 5 refs., 6 figs., 3 tabs.

23245 (CONF-921276–, pp. 79-82) **Influence of I-V characteristics of PV cell on stand alone PV power systems.** Tsuda, I. (Electrotechnical Laboratory, Tsukuba (Japan)); Kurokawa, K. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

In the stand alone photovoltaic (PV) power generation system, it is judged probable that the optimized operating point of PV cell differs from the operating point of PV power generation system including the actual lead acid battery. To elucidate its influence, cases which differed from one another in I-V characteristics of the used PV cell were compared by simulation all through the year. As the system is to be fed with AC load, DC is converted into AC by an inverter for the feeding. The lead acid battery is connected with the PV cell array in a form excluding the DC-to-DC converter. The fluctuation in operating voltage of system is linear against that in optimized operating voltage of PV cell with a gradient of about 0.5. The optimized operating voltage of system happens to be higher than that of PV cell due to self-discharging of the lead acid battery. In the region where the ratio of voltage at the optimized operating point is higher than 0.6 to the release voltage, the larger that ratio is, the larger the system scale is known to be. 2 refs., 9 figs., 2 tabs.

23246 (CONF-921276–, pp. 83-86) **Development of intermittent flow redox battery. Part 2.** Tsuda, I. (Electrotechnical Laboratory, Tsukuba (Japan)); Kurokawa, K.; Nozaki, K. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

A redox flow battery which is promising as a battery to be used for the photovoltaic power generation system was operated in a practical operation mode by increasing the number of cells up to 46 and making them four-stack structured. The operation result was reported in the present paper. Cells which constitute the same stack are fed in parallel with electrolyte of redox flow battery. Because dispersion does consequently not occur in charged state among the cells, the terminal voltage of battery can be changed by switching the output use terminal. In the operation with flow stoppage, the current efficiency can be designed to be considerably heightened. At the time of weak charging/discharging current, the intermittent flow operation is higher in performance than the continuous flow operation. However with strengthening in the above current, it lowers and approaches the continuous flow operation in performance. Even if the cell voltage happened to be anomalous in value, it did not lower in performance with a result which was optimized by operating the pump for 60 seconds. From the foregoing, the lowering in performance of both continuous and intermittent flow operations was known to be attributable to the piping loss around the stack. 3 refs., 8 figs., 3 tabs.

23247 (CONF-921276–, pp. 87-90) **Characteristics of wave shifting device.: Effect of the diffused reflection face.** Takahashi, K. (Science University of Tokyo, Tokyo (Japan)); Tani, T.; Saito, S.; Nakaide, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

For a possibility of high efficiency photosynthesis by the plants, research is being made by taking the absorption characteristics into consideration on a wavelength-by-wavelength basis and thus shifting the wavelength. In the present study which was within a series of the above research, it was designed as a wavelength shifting device to use an acrylic resin-doped fluorescent dye concentrator which is called LSC (luminescent solar concentrator) and treat the LSC surface by a diffused reflection surface treatment in order to intensify the light emission. The above device was then proved effective. As the reflective index of acrylic resin used for the experiment is 1.5, the critical angle of incidence is $\sin^{-1}(1/1.5) = 41.8°$. As a result of simulation, the intensity of light emission from the treated surface upon diffused reflection surface treatment is 1.62 times as strong as that before the treatment, which means a considerable strengthening in it through the treatment. In the experiment, the strengthening in it is highest when the surface upon which the light is incident (i.e., light-receiving surface) is made a diffused reflection surface by treatment with sandpaper #80. At that time, the strengthening ratio was about 26% so that the diffused reflection surface treatment was known to be considerably effective. 7 refs., 6 figs., 1 tab.

23248 (CONF-921276–, pp. 91-94) **Concentration ratio and collection efficiency of a luminescent solar concentrator.** Sakuta, K. (Electrotechnical Laboratory, Tsukuba (Japan)); Sawata, S.; Tanimoto, M. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Research is being made on the luminescent solar concentrator (LSC) which utilizes the absorption/reradiation by the fluorescent body and light confining by total reflection between the parallel flat plates. In the present study, relation was elucidated between the geometric concentration ratio and collection efficiency of LSC through experiment by a prototype LSC and calculation by a Monte Carlo simulation. Used is a perylene pigment-doped acrylic resin plate which was cut to 30, 100, 300 and 1000mm square, and polished on the surface edge. For the experimental prototype LSC, the lowering in collection efficiency against the heightening in geometric concentration ratio was known not to be so large in the region where the absorption by the base material was negligible. The result of Monte Carlo simulation agreed almost with the experimental result by the prototype so that the concentration process by the present LSC was firmly known to be correctly described. 5 refs., 8 figs.

23249 (CONF-921276–, pp. 95-98) **High efficiency crystalline silicon solar cells.** Nanmori, T. (Sharp Corp., Osaka (Japan)); Okamoto, S.; Shibuya, N.; Nunoi, T.; Sawai, H. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

In order to design the heightening in efficiency of crystalline silicon solar cell, study was made, as reported in the present paper, of light-receiving front surface electrode configuration and rear surface reflection effect by using monocrystalline base plate and sizing a cell from it to a practical level of 5cm square. Result was also reported of experimental cell production. As a result of calculating the pitch, bottom breadth and thickness of subgrid optimized for the light-receiving front surface electrode configuration, it was made clear in case of 1mm pitch that the thickening in subgrid rather than the enlarging in bottom breadth largely contributes to the heightening in cell characteristics. In the study of rear surface reflection effect, it was made clear that the long wavelength sensitivity of cell is heightened together with improvement in light confining effect by forming an electrode made of silver, high reflection material on the P^+ layer surface from which aluminum-pasted alloy layer is removed. Upon experimental cell production based on

the foregoing result, the 5cm square cell of practical size gave a conversion efficiency of 20.4%. 6 figs.

23250 (CONF-921276–, pp. 99-102) **Simulation calculation of running mode on "solar car race Suzuka '92" and the results.** Kanayama, K. (Kitami Institute of Technology, Hokkaido (Japan)); Baba, H.; Endo, N.; Tezuka, H.; Koyano, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Both solar cars SEV-1 and Blue Eagle which were developed by Kitami Institute of Technology and Kyocera Corp. participated in the "Solar Car Race Suzuka '92" held on 8 and 9 August, 1992. Prior to proceeding with the race, a traveling guidance was prepared through running mode design by simulation in advance from the course condition, radiant quantity of sunlight and principal particulars of car. Correlation was investigated between the required time per round and traveling speed in the actual race. For calculation by simulation, the course was divided into 53 sections, in each of which the slope, direction and time were obtained. Then, the calculation was made of solar cell power output, speed, traveling distance, motor shaft torque, feeding energy and total efficiency of the solar car at the different points. Finally, the required time, reserved energy in batteries and dependency on solar cells were calculated, which gave the optimized result in running mode. The actual traveling condition in the race could be almost as per the above calculation by simulation. 4 refs., 6 figs., 2 tabs.

23251 (CONF-921276–, pp. 115-118) **Studies of solar air collectors with solar cell modules as the cover.** Ito, S. (Kanagawa Institute of Technology, Kanagawa (Japan)); Miura, M. 30 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Both experimental and theoretical studies were made of characteristics of a thermal collector which used partially sunlight-transparent photovoltaic cell modules as a surface cover. The photovoltaic cell modules having an opening area ratio of 50% were used as a collector plate as well as surface cover. In experiment, air was made to flow in a space between the collector plate and bottom collector plate for forming an solar air collector which collected the solar heat. Then, obtainment was made of both its electric power generation and solar air collection characteristics. In the theoretical study, influence was investigated of thermal medium temperature, wind speed and opening air ratio on the thermal collection efficiency. Though having an area of 0.40m^2, one solar cell module outputs comparatively low power of about 5W at 600W/m^2 in radiant quantity of sunlight. That power was weakened by about 18% after elapsing of one year. When the intensity of sunlight radiation was comparatively strong, a thermal collection efficiency attained to about 38%. With heightening in sunlight-transparency of surface cover, that efficiency heightens due to increasing in thermal quantity received on the bottom collector plate. It was also theoretically shown that influence of wind speed is large on that efficiency. 3 refs., 8 figs.

23252 (CONF-921276–, pp. 103-106) **Make and appraise the performance of SEG hybrid car.** Hase, J. (Tokyo University of Agriculture and Technology, Tokyo (Japan)); Moriya, T.; Horigome, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Designed by simultaneously adopting the merit of electric cars and that of gasoline cars which are very widely used at present, hybrid car was developed for the possibility of being practically used as a next generation car. As is the case with ordinary passenger cars, the gasoline engine arranged in the front body of prototype hybrid car drives the front wheels, while the electric motor and batteries done in its rear body do the rear wheels. The solar cells (about 200Wp) fitted on the car body can feed about 30% of the required energy to be consumed. In case of ten-mode traveling, the car gave a sufficient practicability even by using a comparatively low output motor of 5.5kW. Switching could be made without shock during the test on starting up the gasoline engine at 20km/h in speed and disconnecting the electric motor from the driving system. As a result of both actual measurement and simulation, 20 to 30% of the required power to be used were known to be feedable by the solar cells mounted on board under a bright sky. 3 refs., 10 figs.

23253 (CONF-921276–, pp. 107-110) **Development of excellent practically usable solar electric vehicle.** Fujinaka, M. (Tokyo Denki University, Tokyo (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Electric vehicle (EV) was designed by development through the lightening in weight, improvement in discharging characteristics by recomposition of batteries and effective utilization of photovoltaic cells mounted on board. 960kg were lightened to 830kg by removing unnecessary parts as many as possible from a CR-X, Honda-make gasoline car. The necessary energy was about 10% saved for the traveling by rolling resistance energy. The rated capacity was about 5% improved by designing a recomposition of batteries to lighten the load on them against the strong discharging when the EV started up. About 8% of the traveling energy were made self-feedable on the assumption that energy of 1.2kwh was daily obtainable under a bright sky by connecting 200W output from the high performance monocrystalline silicon solar cells to the main batteries and 40W output from the flexible amorphous silicon solar cells to the auxiliary batteries. The traveling distance by one time of changing attained 60km in 1989 and 1990. The EV was optimized in performance with a two-speed gear motor fed with energy from the batteries which formed two series of 48V in parallel. 9 refs., 10 figs.

23254 (CONF-921276–, pp. 119-122) **Simulation study on energy consumption of single family house with solar heating and PV systems.** Udagawa, M. (Kogakuin University, Tokyo (Japan)); Minami, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Assuming that a solar domestic hot water (DHW) heating system together with photovoltaic (PV) cells was installed in a single family house, the performance of both solar heating and PV systems in the house was predicted by a simulation conducted for the year. Located in Tokyo, the model house was a wooden house having a total floor area of 126m^2. A heat collector and PV cells were installed on the roof facing south with a tilt angle of 60° and 35°, respectively. The solar heating system is divided into solar DHW supply system and DHW floor heating system. The array of PV cells was formed by a connection in three series parallel respectively having nine modules, each of which comprised 36 cells. As a result of simulation, the solar DHW floor/air heating system excelled in comfortability however without giving a considerable lowering in power required for the air heating. The solar DHW supply system together with PV cells had an energy saving effect for the year on the house by saving approx. 53% of the required energy for the house which was without installation of that system. 7 refs., 9 figs., 3 tabs.

23255 (CONF-921276–, pp. 155-158) **Cold storage system operated only by renewable energy.: Development of "solar J box".** Ouchi, K. (Mitsui O.S.K. Line, Ltd., Osaka (Japan)); Imamura, A. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Research and development are made on a new type of cold storage system (Solar J. System) which is gentle to the environment using ice made from cold winter air in cold districts as a cold heat source and an electric fan powered by the photovoltaic power generation for cold air circulation. The Solar J. Box is a system in which the two ISO type floating containers are thermally insulated on their inside and outside surfaces, and one container stores approximately 10 tons of low-temperature stores of farm products, etc. as a storage house and the other houses an ice container such as a drum as an ice box. Both containers are connected by pipes. In the system, by circulating air with a ventilating fan powered by solar cells and electric batteries, heat exchange is made between ice and stores, and the stores are kept at low temperatures of about 0-5°C. As for ice, cold winter air below the freezing point in the cold district is let in to the ice box and is naturally convected for the heat exchange, and the water of the ice box is changed to ice. The desired performance of the system is verified through the long-term (6 months) test conducted on the storage of potato. 8 figs.

23256 (CONF-921276–, pp. 207-210) **Analysis on solar cogeneration system with thermoelectric devices.** Tashiro, T. (Tokyo University of Agriculture and Technology, Tokyo (Japan)); Suzuki, A.; Kobayashi, S.; Horigome, T.; Tanaka, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

With an objective of utilizing solar energy effectively, this paper discusses theoretically a system to supply heat and electric power simultaneously using thermoelectric devices. The system consists of a collector, thermoelectric elements, power loads, thermal loads, and piping and conductors to link them. The heat collected by the collector is conducted to the thermoelectric elements which in turn heat the high-temperature side junctions. Electric potential generated from temperature difference in the elements is taken out externally as electric power. The low-temperature side junctions are also linked with piping, and supply heat to the thermal loads. Because the collected energy turns into electric power and heat finally, the overall system efficiency agrees with the collector efficiency, which can be superior to that in solar cells if a collector with superior performance even at elevated temperatures is used. A conventional light-heat hybrid system comprising a collector and solar cells exhibits high efficiency when the collector temperature is close to the air temperature, but the efficiency drops sharply at elevated temperatures. On the other hand, the present system has less efficiency reduction even at high temperatures and provides increased power generation ratio. The system can cover wide applicable temperature ranges, and can be used suitably for simultaneous heat and power supply. 8 refs., 6 figs., 2 tabs.

23257 (CONF-921276–, pp. 211-214) **Optimum design of composite panel with photovoltaic-thermo module.** Sasamoto, Y. (Science University of Tokyo, Tokyo (Japan)); Hirata, Y.; Tani, T.; Kadotani, K.; Takahashi, Y. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Photovoltaic-thermo modules were fabricated on a trial basis by combining solar cells with thermoelectric elements that utilize the Peltier effect. Solar cell modules were attached on one side of a heat dissipating sink, and thermoelectric modules operating thereon were fixed on the opposite side. The panel can perform radiation air conditioning by changing the power polarities. An experiment was carried out with a heater that simulates solar cell temperatures attached on one side and thermoelectric elements on the other side, each connected with a DC power supply. Investigations were conducted on the following three cases: (1) Power corresponding to an insolation intensity Ig is supplied only to the heater, varying the panel inclination angle; (2) power is supplied only to the thermoelectric elements for radiation air conditioning; and (3) solar cell output corresponding to Ig is supplied to the thermoelectric elements and at the same time the heater power is supplied to simulate temperature differences between the solar cells and the air temperature. Basic electrical and thermal characteristics were derived. Inclining the panel provided a good heat dissipating effect, and temperature reduction in the heat sink during room heating operation gave a favorable effect on the output. 2 refs., 11 figs., 1 tab.

23258 (DOE/CH/10093–210) **Photovoltaics: Contract lists, fiscal year 1992.** National Renewable Energy Lab., Golden, CO (United States). Mar 1993. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000093. Source: OSTI; NTIS; GPO Dep.

US DOE's Photovoltaics Program has helped photovoltaic technologies evolve from materials and concepts in laboratories to competitive products rolling off automated assembly lines. The program is working to expand industrial capacity while continuing basic and applied technology R and D. This document is a tabulation of photovoltaics R and D that were begun, continued, or completed during this period. National laboratories or industrial, academic, and nonprofit research institutions perform the RR and D activities. The document is organized first by directing organization, then by project title and individual task. Each listing provides the name of contractor, period of performance, funding, objectives, accoplishments, and FY 1993 milestones. An index of contractors is included. (DLC)

23259 (DOE/ER/13188–8) **Nitrogen control of chloroplast differentiation: Annual progress report.** Schmidt, G.W. Georgia Univ., Athens, GA (United States). Research Foundation. Jul 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-84ER13188. Order Number DE93015558. Source: OSTI; NTIS; GPO Dep.

This project is directed toward understanding how the availability of nitrogen affects the accumulation of chloroplast pigments and proteins functioning in energy transduction and carbon metabolism. Molecular analyses performed with Chlamydomonas reinhardtii grown in a continuous culture system such that ammonium concentration is maintained at a low steady-state concentration so as to limit cell division. As compared to chloroplasts from cells of nonlimiting nitrogen provisions, chloroplasts of N-limited cells are profoundly chlorophyll-deficient but still assimilate carbon for deposition of as starch and as storage lipids. Chlorophyll deficiency arises by limiting accumulation of appropriate nuclear-encoded mRNAs of and by depressed rates of translation of chloroplast mRNAs for apoproteins of reaction centers. Chloroplast translational effects can be partially ascribed to diminished rates of chlorophyll biosynthesis in N-limited cells, but pigment levels are not determinants for expression of the nuclear light-harvesting protein genes. Consequently, other signals that are responsive to nitrogen availability mediate transcriptional or post-transcriptional processes for accumulation of the mRNAs for LHC apoproteins and other mRNAs whose abundance is dependent upon high nitrogen levels. Conversely, limited nitrogen availability promotes accumulation of other proteins involved in carbon metabolism and oxidative electron transport in chloroplasts. Hence, thylakoids of N-limited cells exhibit enhanced chlororespiratory activities wherein oxygen serves as the electron acceptor in a pathway that involves plastoquinone and other electron carrier proteins that remain to be thoroughly characterized. Ongoing and future studies are also outlined.

23260 (ETDE-mf–93792318) **Development of plant technique for large scale separation of thin films from amorphous silicon and silicon compounds. Final report.** Reuschling, R.; Mueller, B. Pfeiffer (Arthur) Vakuumtechnik, Wetzlar (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Jun 1992. 90p. (In German). Contract BMFT 0328964A. Order Number DE93792318. Source: OSTI; NTIS (US Sales Only).

The plant technology for large scale separation of amorphous silicon (a-Si:H) should be developed from the point of view of mass-production of thin film solar cells and also opto- electronic components. A modular plant concept with a high degree of automation should be achieved for this, which makes parallel operation of locks and different process reactions an the distribution of the substrate under vacuum possible. The separation of a-Si:H should occur in a 'plasma-box', which is integrated in the process reactors and makes particularly clean a- Si separation possible. To

test the plant technique, a laboratory plant consisting of a look, a process reactor and a vacuum transfer system, should be built and tested. In preliminary test and in the laboratory plant, the critical components, such as substrate fast heating, plasma box, plasma etching system forreactor cleaning, computer control etc, should be optimized. In the context of cooperation, Phototronics are controlling the process know-how and are also the pilot customer for the plant to be developed. (orig.).

23261 (Juel–2636) **Environmental impact statements in the case of research projects - the example of photovoltaic energy conversion. Vol. 5. Environmentally relevant material balances in the prodution of different types of solar cells.** Angewandte Systemanalyse. Hagedorn, G. (Forschungsstelle fuer Energiewirtschaft, Muenchen (Germany)); Hellriegel, E. Forschungszentrum Juelich GmbH (Germany). Programmgruppe Systemforschung und Technologische Entwicklung. Jun 1992. 329p. (In German). Contract BMFT 426-3590-PLI 14120. Order Number DE93791917. Source: OSTI; NTIS (US Sales Only).

The material balances during production of different types of solar cells were analyzed in cooperation with solar cell producers. Part I of this final report contains the results for conventional processes for PV module production from multicrystalline, monocrystalline and amorphous silicon. Part II discusses the possibilities of disposal and recycling of photovoltaic modules. Research has shown that there are hardly any practicable concepts in this field; new solutions must be found if photovoltaic energy conversion is to be applied on a large scale. (orig.).

23262 (LBL–33932) **Spectroscopic studies of Synechococcus sp PCC 7002 phycobilisome core mutants.** Gindt, Y.M. Lawrence Berkeley Lab., CA (United States). Apr 1993. 179p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93013737. Source: OSTI; NTIS; GPO Dep.

The role of the L_{cm} (I), β^{18} (II), and α^{AP-B} (III) chromoproteins in the phycobilisome (PBS) core was investigated using genetically engineered strains of Synechococcus missing different polypeptides. Intact cells, isolated PBS, and subcore preparations for each mutant were studied to determine the effect of that mutation on energy transfer within the PBS core and to the reaction centers. Three mutants lacked the II and/or III polypeptides, while the I chromophore was altered in others. A lower energy absorbing chromophore, A_{max} = 695 nm, was substituted for the I chromophore. The deletion of the II and III subunits had no discernible effect on energy transfer from the PBS to PSII. In cells and isolated PBS, the altered I chromophore acts to quench the PBS complex and to redirect the energy which would be transferred to PSII. In the PBS and subcore preparations, deletion of the III subunit did not alter energy transfer within the core. The deletion of the II subunit from the PBS caused a small decrease in the excited state lifetimes of the final emitters indicating more disorder within the core. The I chromophore was found to absorb at 670nm and to emit at 683nm within the intact PBS. The II chromophore emits at 679nm while the III chromophore emits at 682nm. A strong interaction exists between the I chromophore and the II subunit. Upon deletion of the II subunit from the PBS core, the I chromophore emits at a higher energy. The II subunit could act to stabilize the I chromophore-binding pocket, or exciton coupling could be occurring between the two. The role of the III chromophore is still unclear at this time. The III chromophore does contribute to the RT emission of the isolated PBS, but it transfers energy to I at 77 K. One can conclude that the III subunit is adjacent to the trimer containing the I polypeptide.

23263 (NREL/TP–410-5335) **Photovoltaic Subcontract Program: Annual report, FY 1992.** National Renewable Energy Lab., Golden, CO (United States). Mar 1993. 319p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000092. Source: OSTI; NTIS; GPO Dep.

This report summarizes the fiscal year (FY) 1992 progress of the subcontracted photovoltaic (PV) research and development (R&D) performed under the Photovoltaic Advanced Research and Development Project at the National Renewable Energy Laboratory (NREL)-formerly the Solar Energy Research Institute (SERI). The mission of the national PV program is to develop PV technology for large-scale generation of economically competitive electric power in the United States. The technical sections of the report cover the main areas of the subcontract program: the Crystalline Materials and Advanced Concepts project, the Polycrystalline Thin Films project, Amorphous Silicon Research project, the Photovoltaic Manufacturing Technology (PVMaT) project, PV Module and System Performance and Engineering project, and the PV Analysis and Applications Development project. Technical summaries of each of the subcontracted programs provide a discussion of approaches, major accomplishments in FY 1992, and future research directions.

23264 (NREL/TP–411-5453) **Continuous roll-to-roll a-Si photovoltaic manufacturing technology: Semiannual technical progress report, 1 April 1992–30 September 1992.** Izu, M. (Energy Conversion Devices, Inc., Troy, MI (United States)). National Renewable Energy Lab., Golden, CO (United States); Energy Conversion Devices, Inc., Troy, MI (United States). Apr 1993. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010006. Source: OSTI; NTIS; GPO Dep.

This report describes work performed by ECD to advance its roll-to-roll, triple-junction photovoltaic manufacturing technologies; to reduce the module production costs; to increase the stabilized module performance; and to expand the commercial capacity utilizing ECD technology. The 3-year goal is to develop advanced large-scale manufacturing technology incorporating ECD's earlier research advances with the capability of producing modules with stable 11% efficiency at a cost of approximately $\$1/W_p$. Major efforts during Phase I are (1) the optimization of the high-performance back-reflector system, (2) the optimization of a-Si-Ge narrow band-gap solar cell, and (3) the optimization of the stable efficiency of the module. The goal is to achieve a stable 8% efficient 0.3-m x 1.2-m (1-ft x 4-ft) module. Also, the efforts include work on a proprietary, high-deposition-rate, microwave plasma, CVD manufacturing technology; and on the investigation of material cost reduction.

23265 (NREL/TP–411-5454) **Large-area, triple-junction a-Si alloy production scale-up: Semiannual technical progress report, 17 March 1992–18 September 1992.** Oswald, R. (Solarex Corp., Newtown, PA (United States). Thin Film Div.); O'Dowd, J. National Renewable Energy Lab., Golden, CO (United States); Solarex Corp., Newtown, PA (United States). Thin Film Div. Apr 1993. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010007. Source: OSTI; NTIS; GPO Dep.

This report describes Solarex's work to advance its photovoltaic manufacturing technologies, reduce its a-Si:H module production costs, increase module performance, and expand the Solarex commercial production capacity. Solarex will meet these objectives by improving the deposition and quality of the transport front contact; optimizing the laser patterning process; scaling up the semiconductor deposition process; improving the back-contact deposition; and scaling up and improving the encapsulation and testing of its a-Si:H modules. In the Phase 1 portion of this subcontract, Solarex focused on scaling up components of the chemical vapor deposition system for deposition of the system contact, scaling up laser scribing techniques; triple-junction recipes for module production; and metal-oxide back contacts. The goal of these efforts is to adopt all portions of the manufacturing line to handle substrates larger than 0.37 m^2.

23266 (NREL/TP–411-5456) **Optimization of transparent and reflecting electrodes for amorphous silicon solar cells: Annual subcontract report, 1 May 1991–30 April 1992.** Gordon, R.G. (Harvard Univ., Cambridge, MA (United States). Dept. of Chemistry). National Renewable Energy Lab., Golden, CO (United States); Harvard Univ., Cambridge, MA (United States). Dept. of Chemistry. Apr 1993. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010009. Source: OSTI; NTIS; GPO Dep.

This report describes work to improve the performance of solar cells by improving the electrical and optical properties of their transparent conducting oxides (TCO) layers. Boron-doped zinc-oxide films were deposited by atmospheric pressure chemical

vapor deposition in a laminar-flow reactor from diethyl zinc, tert-butanol, and diborane in the temperature range between 300°C and 420°C. When the deposition temperature was above 320°C, both doped and undoped films have highly oriented crystallites with their c-axes perpendicular to the substrate plane. Films deposited from 0.07% diethyl zinc and 2.4% tert-butanol have electron densities between 3.5×10^{20} cm^{-3} and 5.5×10^{20} cm^{-3}, conductivities between 250 Ω^{-1} and 2500 Ω^{-1} and mobilities between 2.5 cm^2/V-s and 35.0 cm^2/V-s, depending on dopant concentration, film thickness, and deposition temperature. Optical measurements show that the maximum infrared reflectance of the doped films is close to 90%, compared to about 20% for undoped films. Film visible absorption and film conductivity were found to increase with film thickness. The ratio of conductivity to visible absorption coefficient for doped films was between 0.1 Ω and 1.1 Ω^{-1}. The band gap of the film changes from 3.3 eV to 3.7 eV when the film is doped with 0.012% diborane.

23267 (NREL/TP–411-5457) **Structural and electronic studies of a-SiGe:H alloys: Final subcontract report, 1 January 1991–28 February 1993.** Paul, W. (Harvard Univ., Cambridge, MA (United States)). National Renewable Energy Lab., Golden, CO (United States); Harvard Univ., Cambridge, MA (United States). Apr 1993. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010021. Source: OSTI; NTIS; GPO Dep.

This report describes work to produce alloys of a-$Si_{1-x}Ge_x$:H of improved photoelectronic quality by plasma-enhanced chemical vapor deposition (PECVD). The goal was to discover optimum preparation conditions for the end-component, a-Ge:H, to establish whether modification of the usual practice of starting from a-Si:H preparation conditions was advisable. Such modification, found to be necessary, gave films of a-Ge:H with efficiency-mobility-lifetime products ($\eta\mu\tau$) 10^2 to 10^3 higher than were earlier available, in homogeneous environmentally stable material. Both a-Ge:H and a-$Si_{1-x}Ge_x$:H of large x were studied in detail. Alloy material was shown to have $\eta\mu\tau$ 10^2 larger than found earlier. However, just as the $\eta\mu\tau$ of a-Si:H decreases when Ge is added, so also the $\eta\mu\tau$ of these alloys with Si addition. By contrast, the ambipolar diffusion lengths, L_o which are governed by the hole mobility, vary by only a factor of two over the whole alloy series. Using the experimental finding of a small valence band offset between a-Si:H and a-Ge:H compositional fluctuations on a 10-mm scale are suggested to explain the behavior of $\eta\mu\tau$ and L_o The implications for eventual improvement of the alloys are profound, but require direct experimental tests of the postulated compositional fluctuations.

23268 (SAND–93-0023C) **Photocatalysis for the treatment of waste water: Applications involving the removal of metals.** Prairie, M.R.; Stange, B.M. Sandia National Labs., Albuquerque, NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930830–14: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93011669. Source: OSTI; NTIS; GPO Dep.

This paper describes laboratory work investigating the applicability of solar-powered photocatalysis for the treatment of water contaminated with heavy metals and organics. It was found that Ag(I), Au (HI), Cr(VI), Hg(H), Pd(H), and PT(IV) are easily treated while Cd(U), Cu(II), and Ni(II) are not. The importance of the entire photocatalytic redox cycle is demonstrated by showing that the rates of oxidation (of organics) and reduction (of metals) are intrinsically interrelated. Data are presented showing that photoefficiency decreases as light intensity increases in the range of 0 to 17 suns UV. This result suggests that one-sun systems are more efficient than those using concentrated solar radiation. Preliminary data for three samples of actual waste: (1) gold mining leachate, (2) precious metals mining extract, and (3) photographic waste, are described. In general, actual applications are less effective than predicted using laboratory data for clean systems.

23269 (CONF-921276–, pp. 195-198) **Windmill of solar-cell blades.** Morioka, S. (CRC Research Institute Inc., Tokyo (Japan)); Kakita, Y.; Ushiyama, I. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

With an objective of utilizing wind and solar energy simultaneously and complementarily, this paper proposes a solar-cell blade windmill integrating solar cells attached on a drag-type vertical-axis windmill with a large wind receiving area. The paper also considers a panel vertical to the ground since the solar cell panel of this system is a rotating body which can utilize both sides, not the sun facing side alone. Therefore, the total annual insolation amount onto the static face differs very little from that with ordinary panels. Considering the insolation incident to the face rotating with a certain angular speed, the amount of electric power generated from the solar cells was calculated. Solar-cell blade windmills may be used more effectively in areas of high latitudes. Power generation (W/m^2) from windmills of flat plate, cylinder, and Savonius types at a wind velocity of 5 m/s are 3.7, 7.5, and 15.0, respectively. Power generation (W/m^2) from silicon solar Cells attached to the windmills of the above types are 15.2, 24.0 and 16.7, respectively, the Cylinder type windmill being the largest power generator. The total power output, which is a sum of power generated from the windmill and the solar cells, results in a large increase. 5 refs., 4 figs., 5 tabs.

23270 (CONF-921276–, pp. 199-202) **Field test and simulation of photovoltaic/wind hybrid generating system.** Furuya, H. (Toyohashi University of Technology, Aichi (Japan)); Tsuchiya, Y.; Sakakibara, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

A prototype photovoltaic/wind hybrid generating system was constructed and a series of field test and simulation was carried out for 21 days. A solar cell array with a maximum output of 80W, a 150-W wind power generator, and an auxiliary generator were connected to a storage battery (two 12V, 170-Ah batteries in series). The auxiliary generator turns on when a battery charge has fallen to 20%, and turns off when it rises to 60%. The dummy load turns on at the battery charge of 100%, and turns off at a rate below 100%. Kamishima Island was used as a model for the daytime load curves. Characteristic formulas were formulated for each device using the experimental values, and insolation, wind velocities, and daytime load patterns were inputted for simulation. The results of the field test and the simulation showed good agreement in the battery charge, voltage and charge power although some disagreement was recorded in the time for turning on and off the auxiliary generator. Delay in the generator on-off time increased when a sampling interval exceeded 40 minutes in the simulation. 6 refs., 4 figs.

23271 (NREL/TP–411-5450) **Photovoltaics for municipal planners: Cost-effective municipal applications of photovoltaics for electric power.** National Renewable Energy Lab., Golden, CO (United States). Apr 1993. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000099. Source: OSTI; NTIS; GPO Dep.

This booklet is intended for city and county government personnel, as well as community organizations, who deal with supplying, regulating, or recommending electric power resources. Specifically, this document deals with photovoltaic (PV) power, or power from solar cells, which is currently the most cost-effective energy source for electricity requirements that are relatively small, located in isolated areas, or difficult to serve with conventional technology. Recently, PV has been documented to be more cost-effective than conventional alternatives (such as line extensions or engine generators) in dozens of applications within the service territories of electric, gas, and communications utilities. Here, we document numerous cost-effective urban applications, chosen by planners and

utilities because they were the most cost-effective option or because they were appropriate for environmental or logistical reasons. These applications occur within various municipal departments, including utility, parks and recreation, traffic engineering, transportation, and planning, and they include lighting applications, communications equipment, corrosion protection, irrigation control equipment, remote monitoring, and even portable power supplies for emergency situations.

1407 Solar Thermal Power Systems

23272 (SAND–92-2346C) **High-flux testing of heat pipes for point-focus solar collector systems.** Adkins, D.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930830–13: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93011581. Source: OSTI; NTIS; GPO Dep.

The Department of Energy is currently funding the development of a power conversion system that uses a parabolic-dish collector to direct solar energy onto a 25-kWe Stirling engine/generator system. As part of this program, heat-pipe solar receivers are being developed to transfer 65 kW of thermal energy from the focus of the concentrator to the heater-tubes of the engine. These receivers operate at temperaturesup to 800°C and with peak flux loads approaching 100 W/cm^2. Designing a wick structure that can withstand these operating conditions has been a major part of the heat-pipe receiver development activities. Recently, bench-scale tests were performed on two advanced artery structures that are candidates for full-scale receivers. The arteries were able to lift sodium over 40 cm to cool a 30-cm^2 patch on the bench-scale receiver's surface. Peak flux levels of approximately 80 W/cm^2 were applied to the receiver surface.

1409 Solar Thermal Utilization

The present paper reported the structure, and thermal collection and other basic performances of city water pipe-pressurized vacuum type solar water heater which was developed in order to solve problems raised in the conventional water heater by solar heat and structure an energy saving hot water supply system to be used for a wider purpose. The water heater is built up with a copper-made thermal collection/hot water storage tube which is coated with a wavelength-selective film on its outside surface and inserted inside a glass tube. Then, space is vacuumized between both the tubes. The city water is taken from the upper header down to the bottom through the inside of thermal collection/hot water storage tube. Then, it flows in reverse outside the header. Because of vacuumized glass tube, obtained was hot water which was higher by about 25 centigrade at the maximum than that in case of the non-vacuumized one. Even in winter, hot water of 55 centigrade could be obtained under the bright sky. As for the dependency on tilt angle, the most practical one was 45° for the installation to heighten the reach temperature in winter. With a possible wide utilization of reflected sunlight radiation, the thermal collection efficiency was heightened by about 20% and 15% with a reverse surface of concrete and tiles, respectively. Also with a possible pressurizing use of hydrostatic pressure, the obtained hot water agreed well with the ideal water in saturated steam pressure curve. 2 refs., 11 figs., 1 tab.

23274 (CONF-921276–, pp. 127-130) **Appraisal of solar energy installation from view point of repaymental period.** Yui, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

To judge whether or not the water heater is economical, economic analysis was tried of both non-concentrated plane type collector and sloped solar frame concentrator (SSFC) which was proposed as a simplified concentrator. Assuming that the repayment period of installations and equipment is generally 20 years, among which some machinery enters into a period for the repair or renewal in 15 years at the earliest, the said plant does not seem to be feasible unless it annually earn more than 5% or 1/20 of the invested amount by selling the secondary energy generated by it. The annual earning ratio to the invested installation of water heater only for the hot water supply use is about 7%, which means that the required number of repayment years (n) is 11.2. That n is enlarged to 13.8 if the above water heater is extended in performance to a plant which simultaneously heats the air in the house. If used for both air heating and hot water supply, the presently proposed SSFC is 9 in n. The n is 12.8 with a sufficient feasibility in case that the air heating, hot water supply and self-supply of power are designed to be done all together by an SSFC hybridly with solar cells. 1 ref., 2 figs.

23275 (CONF-921276–, pp. 131-134) **Reflectance and absorptance of silica gel bed used in the desiccant/regenerator.** Saito, Y. (Osaka Institute of Technology, Osaka (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

The air cooling with desiccant-using dehumidification is judged promising in the high temperature and high humidity region. In the present research, study was made of a plant to heat and regenerate adsorbent by collecting radiant sunlight directly on a desiccant bed in which the desiccant was silica gel particles as solid adsorbent. The reflectance/transmittance/absorptance model of the glazed desiccant bed was set up as follows: However with a partial reflection on the glazing, the collected light (I_C) reaches the desiccant bed after permeating the glazing. Upon the above reflection, the reflected I_C further becomes partially I_C and partially diffused light (I_D). The I_C which permeated the glazing and reached the desiccant bed partially reflects and partially becomes I_D. All the reflectance, transmittance and absorptance factors were obtained against the total sunlight radiation by experimentally obtaining the necessary values for the model analysis. As a result, the radiant quantity of sunlight to be absorbed by the desiccant layer could be obtained as a function of water content of the silica gel. 3 refs., 6 figs., 3 tabs.

23276 (CONF-921276–, pp. 135-138) **Effective thermal conductivity of a silica gel bed used in the desiccant/regenerator.** Saito, Y. (Osaka Institute of Technology, Osaka (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

The desiccant/regenerator by direct solar heat utilization was taken into concept and its regeneration characteristics were investigated. A desiccant bed fully filled with silica gel particles is used in the desiccant/regenerator and the silica gel layer directly absorbs the radiant solar heat. Then, temperature differential is generated between the upper surface and lower portion of desiccant/regenerator, and therefore, a thermal transfer by conduction exists. The effective thermal conductivity which is necessary for studying the above transfer was experimentally obtained and its relation formula was also done by making it to be a function of water content of the silica gel. The desiccant bed does not form a continuous solid system but does a discontinuous solid system filled with spherical particles of adsorbent. Therefore, a complicated thermal

transfer is generated in the desiccant bed. A non-steady one-dimensional thermal transfer was modeled through analyzing the thermal transfer mechanism. Then, the effective thermal conductivity of desiccant bed was obtained by simulation through formulating the thermal balance. Both experiment and calculation results agreed with each other. Therefore by using the results, the thermal transfer in the desiccant bed can be calculated by making it to be a function of water content of the silica gel. 4 refs., 10 figs.

23277 (CONF-921276–, pp. 143-146) **Heat transfer characteristics of underground ducts for utilizing soil heat of a greenhouse. 3rd Report.: Experiments on the porous drain pipe ducts.** Yoshioka, T. (Kumano Technical College, Mie (Japan)); Taga, M.; Ochi, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Through outdoor test conducted by applying drain pipes to an actual solar greenhouse, their thermal storage, recovery and other characteristics were compared with those which had resulted from the previous experiment on the conventional polyvinyl chloride (PVC) pipes. Totally nine drain pipes each of which was a 100mm inside diameter steel pipe externally covered with ventilative meshes of a net as a duct pipe were buried horizontal with an underground depth of 480mm together with a 100mm inside diameter PVC pipe buried in the mid-rank of those drain pipes. The greenhouse was covered with a pitched film. The ground soil to store the heat is silty and about 15% in average water content. In case of using the ventilative drain pipes as duct pipes, a considerable improvement was made in heat exchanging performance with the ground soil. If the crops do not exist in the greenhouse, the heat exchanging rate through ducts is lower than that in case the crops do there. However if the drain pipes are used as duct pipes, the ground soil heat can be effectively utilized with activation in heat transfer through ducts even if the crops do not exist there. The difference in temperature between the room and ground soil must be taken into account for controlling the circulation fun. 2 refs., 11 figs., 2 tabs.

23278 (CONF-921276–, pp. 163-166) **Sprinkler floting-collector-type solar pond.** Ueda, Y. (Kinki University, Osaka (Japan). Faculty of Science and Technology); Taga, M.; Matsuoka, Y. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

An air-type gas engine heat pump using a solar pond as a heat source was driven to heat a mango greenhouse. The solar pond is a salt-free type being different from a salt water concentration gradient type, which was disposed with a black solar energy absorbing board on its surface to collect heat through sprinkling and circulating the pond water. When sprinkling amount is increased during summer, the pond water absorbed more heat from the absorbing board making the temperature rise large in the upper layer of the pond water during day time, thus providing high heat collecting efficiency. With less sprinkling amount, the pond water absorbed the heat insufficiently making the temperature rise smaller, resulting in reduced efficiency. With a dual roof filled with pellets for heat insulation, the nighttime reduction in temperature was less in the space over the pond suppressing nighttime heat dissipation. A heat pump is driven during winter, wherein the heat is absorbed from the pond reducing the water temperature by 2°C. The greenhouse interior was maintained at 5°C or higher, a required temperature for growing mangoes. The calorific power supplied to heat the greenhouse from among the heat absorbed from the pond was 20%, but is still more advantageous than using a heat pump utilizing low temperature atmospheric air as a heat source. 3 refs., 7 figs., 2 tabs.

23279 (CONF-921276–, pp. 167-170) **Performance of various solar ponds.** Takarayama, N. (Kinki University, Osaka (Japan). Faculty of Science and Technology); Taga, M.; Matsuoka, Y. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Performance of salt-free solar ponds other than the salt water concentration gradient type ponds was searched using indoor solar simulator experiments and theoretical calculations. Metal halide lamps producing a light closer to natural light were used as a light source. A pellet delivering type solar pond was disposed with a certain space over the heat storing water surface. A transparent dual thin film cover having a space of 8 cm was installed over the space, filled with styrofoam particles with sizes from 3 mm to 5 mm while the lamps are turned off. A surface covered type solar pond was disposed with transparent heat insulating films with air layer dually on the heat storing water surface. A surface heat collecting type solar pond had a black heat insulating board with air layer and a 100-mm heat insulating styrofoam board floated on the water surface, over which warm water in the bottom of the water layer was sprinkled and circulated. The black board absorbed the energy in the irradiated light efficiently and transferred the heat to the pond water, exhibiting the best heat collecting performance, with the equilibrium temperature having reached 53°C after eleven days. The surface covered type and the pellet delivering type ponds showed approximately the same performance. The theoretical calculations agreed approximately with the experimental values enabling to discuss the performance difference because of types and structures. 3 refs., 12 figs.

23280 (CONF-921276–, pp. 175-178) **Studies of open cycle absorption dehumidifying/drying system. Part 9.: Simulation model for a natural convective glazed solar regenerator.** Jun, L. (Waseda University, Tokyo (Japan)); Kimura, K.; Choi, K.; Orima, M.; Fukumitsu, W. 3 Dec 1992. 305p. From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

This paper proposes a simulation model for a natural convective solar regenerator in an open cycle absorption dehumidifying/drying system. A solar regenerator has a flat tilted surface open to the atmosphere. On the surface, a dilute LiCl adsorbent solution flows from the top and becomes a dense solution towards the bottom due to a waver evaporation. The regenerated solution can be used to drive a dehumidifying/drying or an air conditioning system. The tilted surface is covered with a glazed cover. In the air space therein, water moves between a natural air convection and the dilute solution to develop condensation. Calculations have agreed well with the measurements. The evaporation rate increased linearly with the insolation. Because of large effect of the solution inlet temperature on the evaporation rate, it is desirable to reduce losses in preheat from a heat exchange and solution heat during circulation. Adequate length of the equipment may be selected on the basis of inlet flow rates and outlet yields. Under the same area and condition, the shorter the equipment length, the higher the regeneration capability. 5 refs., 9 figs., 1 tab.

23281 (CONF-921276–, pp. 179-182) **Study on the natural circulating type desalination system by the solar heat.** Kugai, K. (University of the Ryukyus, Okinawa (Japan)); Nagai, M.; Yaga, M. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

This paper discusses a sea water desalination system utilizing natural vapor circulation as a result of solar heat. The system consists of an evaporator, vapor transporting pipes, and a condenser, uses solar heat as the heat source, and operates on difference in temperatures in the evaporator and the condenser. The present paper reports on the evaporator. An experiment was carried out using black painted tap water 2-inch pipes with a length of 2 m and transparent acrylic pipes of the same size as evaporators installed horizontally on an outdoor field. Installing 4-m long vertical pipes on both ends of the evaporator promotes evaporation effect 1.32 to 2 times as much as with 2-m long pipes, resulting in as high maximum evaporation efficiency as 71%. Promoting the evaporation

requires replenishing the evaporator incessantly with air with low saturation. Attaching 2-m long vertical pipes on the wick pipe evaporator with black felt fabrics inserted into transparent pipes derived an evaporation of 0.63 kg/m^2. The evaporation is subjected to effect of winds in addition to insolation, and is promoted especially with wick pipes. Evaporation in the wick pipes may be blocked with water drops generated in the evaporator. 4 refs., 10 figs., 4 tabs.

23282 (CONF-921276–, pp. 247-250) **Evaluation of performance for solar house with trombe-wall. Part 2.: Thermal performance in heating.** Nakajima, Y. (Kogakuin University, Tokyo (Japan)); Sekine, K.; Makita, T.; Watanabe, T.; Yoshida, N. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

An investigation was made on thermal characteristics of a solar house with Trombe-walls when an auxiliary room heating system is used to maintain the room temperature from 19.5°C to 20.5°C. Rooms with the Trombe-walls suppressed heat loss lower than those without the walls during the daytime. The auxiliary heating system was stopped during the nighttime for sleeping comfort, but the rooms with the Trombe-walls kept the room temperature drop and the heat loss smaller. Measurements of the Trombe-wall temperatures at its inner and outer surface showed a peak temperature at its outer surface of 23.3°C at about 15:00 hours, while that at its inner surface reached 16.6°C at about 20:00, which was maintained unchanged until 23:00 when the room heating was stopped. This means that the Trombe-walls absorbed heat from the auxiliary room heating system and raised the inner surface temperature. The solar heat can be utilized more effectively if heat insulation is installed inside the Trombe-wall to reduce the loss due to absorption of the heat for room heating during the daytime when the inner Trombe-wall surface temperature is low. The heat insulation would be removed during the nighttime when the inner surface temperature has become higher than the room temperature to give off the heat into rooms after the heating system has been stopped. 5 refs., 7 figs., 3 tabs.

23283 (CONF-921276–, pp. 251-254) **Evaluation of thermal enviornment with a system for a solar house employing an air-type roof collector.** Ohashi, K. (Kogakuin University, Tokyo (Japan)); Nakamura, J.; Suzuki, K.; Sakuragi, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Explanation was made of an air-type solar system which blows air with collected heat under the floor. Outdoor air taken from the air suction inlet under the eaves into the roof-space is heated by a heat collecting portion (190m^2) of the roof surface. Heat is released after having been collected by the hot water supply coil in spring, summer and autumn. Blown under the floor, the hot air is released after having heated the floor board in winter. There is a hot water pipe panel heater as an auxiliary for the air heating use under the cloudy sky. A thermal collection efficiency attained to 14 to 18% against the total radiant quantity of sunlight on the horizontal surface corresponding to the heat collecting portion under the bright sky. Blown to under the floor, the air with collected heat up to 45 centigrade at the highest heated the floor surface up to about 26 centigrade and released heat to the room by convection and radiation, which resulted in giving an efficient floor heating effect. Room temperature was uniformly distributed in both vertical and horizontal directions by the air circulation and floor heating effect. The outdoor temperature and underground temperature under the building for the year were calculated by using the physical values of soil heat and fluctuant factors in outdoor meteorology. As compared with the actually measured value, the thus calculated value differed from it due to external turbulence in underground layer as shallow as 0.5m in depth. However, both the values agreed well with each other in deeper underground layers than the above. 4 refs., 11 figs., 2 tabs.

23285 (LTKK-EN-A–16) **Solar heating of urban areas.** Saastamoinen, J.J. Lappeenranta Univ. of Technology (Finland). Dept. of Energy Technology. 1989. 76p. Order Number DE93794786. Source: OSTI; NTIS.

In the usual solar heating systems for urban areas, heat is collected by solar collectors and stored for the use of the winter. In the system considered here, the urban area itself is covered by an insulating transparent roof. The main features are the following: the temperature of the area increases due to the solar radiation, which means a decrease in the energy consumption of the heated buildings in the area. The heat losses due to conduction through the walls, due to air leakage and ventilation are decreased. The heating devices can be dimensioned smaller; the summer starts earlier and lasts longer in the covered area. Trees and other plants requiring warmer climate can be grown in the area; the area can be used as a source for low temperature heat during the summer. This heat is stored for later use. The annual operation, and the operation in different weather conditions is discussed. The effect of different parameters on the operation is considered. The solar heating with transparent roof is especially suitable for shop markets. The covered area can be used as an entrance way to the shops. The heat losses through the shop windows and due to air leakage in the opening of the shop doors is greatly decreased due to the solar energy.

23286 (NEI-DK–1152) **Use of solar heat in industry: Perspectives and possibilities for development. Final report.** Cowiconsult Raadgivende Ingenioerer A/S, Lyngby (Denmark). Mar 1993. [147p.] (In Danish). Contract ENS-51181-91.0010. Order Number DE93794690. Source: OSTI; NTIS.

A preliminary project concerning the possibilities for utilizing solar heating within industry is described. The emphasis is on an evaluation of solar collectors. A short description is given of the underlying theory of solar heating and solar collectors as a background for the understanding of efficiency curves for the latter. It is expected that energy consumption in Denmark until the year 2030 will rise by 60%, if production is doubled. If energy saving initiatives are carried out it could rise by only 15%. The use of solar energy for heating air and liquid could contribute to a further reduction in the use of fossil fuels. Based on figures from 1984, solar energy could cover ca. 14% of energy consumption in industry by 2030. Most energy savings could be achieved by using solar heat within the food industry. It is concluded that it is feasible to use solar collectors of a simple design for preheating of water and air and predicted that there are good chances of developing a market with a sound economical basis. There are good potentials for industrial use of solar energy for heating water for washing, cleaning and rinsing, but the cost of solar collectors must be reduced. Much energy is used to obtain high temperatures for industrial purposes and it is claimed that solar energy could be an important supplement. Solar collectors of suitable design have been developed for this purpose, but market promotion is needed. The publication contains a considerable number of diagrams illustrating the design of solar process heating systems and also relevant data. (AB) (83 refs.).

23287 (NREL/TP–432-5068) **DOE Solar Process Heat Program: FY1991 Solar Process Heat Prefeasibility Studies activity.** Hewett, R. National Renewable Energy Lab., Golden, CO (United States). Nov 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. (CONF-930435–8: SOLAR '93: American Society of Mechanical Engineers (ASME)/American Solar Energy Society (ASES) joint solar energy conference, Washington, DC (United States), 22-28 Apr 1993). Order Number DE93010010. Source: OSTI; NTIS; GPO Dep.

During fiscal year (FY) 1991, the US Department of Energy (DOE) Solar Process Heat Program implemented a Solar Process Heat Prefeasibility Studies activity. For Program purposes, a prefeasibility study is an engineering assessment that investigates the technical and economic feasibility of a solar system for a specific application for a specific end-user. The study includes an assessment of institutional issues (e.g., financing, availability of insurance, etc.) that impact the feasibility of the proposed solar project. Solar process heat technology covers solar thermal energy systems (utilizing flat plate or concentrating solar Collectors) for water heating, water preheating, cooling/refrigeration, steam generation, ventilation air heating/preheating, etc. for applications in industry, commerce, and government. The studies are selected for funding through a competitive solicitation. For FY 1991, six projects were selected for funding. As of August 31, 1992, three teams had completed their studies. This paper describes the prefeasibility studies activity, presents the results from the study performed by United Solar Technologies, and summarizes the conclusions from the studies that have been completed to date and their implications for the Solar Process Heat Program.

23288 (NREL/TP–471-5099) **Economic status and prospects of solar thermal industrial heat.** Williams, T.A.; Hale, M.J. National Renewable Energy Lab., Golden, CO (United States). Dec 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. (CONF-930435–9: SOLAR '93: American Society of Mechanical Engineers (ASME)/American Solar Energy Society (ASES) joint solar energy conference, Washington, DC (United States), 22-28 Apr 1993). Order Number DE93010004. Source: OSTI; NTIS; GPO Dep.

This paper provides estimates of the levelized energy cost (LEC) of a mid-temperature parabolic trough system for three different development scenarios. A current technology case is developed that is representative of recent designs and costs for commercial systems, and is developed using data from a recent system installed in Tehachapi, California. The second scenario looks at design enhancements to the currenttechnology case as a way to increase annual energy output and decrease costs. The third scenario uses the annual energy output of the enhanced design, but allows for cost reductions that would be possible in higher volume production than currently exist. A simulation model was used to estimate the annual energy output from the system, and the results were combined with cost data in an economic analysis model. The study indicates that R&D improvements in the current trough system show promise of reducing the (LEC) by about 40%. At higher production rates, the LEC of the solar system with R&D improvements could potentially be reduced by over 50%.

23289 (CIEMAT–680) **Stretched membrane heliostats: Design and structural analysis of reflectant module and support of a heliostat of 9 m. diameter and 60 m^2 of reflectant surface.** Figarola Torres, J.M. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 40p. (In Spanish). Order Number DE93796632. Source: OSTI; NTIS.

After having designed and built at CIEMAT a first prototype of a stretched membrane heliostat of 3 m diameter, the design and the structural analysis of the different components included in the reflectant module and support of another heliostat, this one of 9 m. diameter and 60 m^2. of reflectant surface, are shown in this report. This last heliostat will be mounted on a pedestal and its driving devices at the Solar Platform of Almeria. In order to optimize design and performance, the structural analysis of its basic components has been analyzed with the finite elements program ANSYS. The following elements have been subject to analysis: the membrane and their ring supports, stretching system and the structural support. A similar scheme to the one applied to the previous prototype has been used on the focus control system. That includes a linear transducer, a variable frequency and a fan. Finally it has to be pointed out that substantial improvements have been achieved with respect to the first prototype concerning design and cost. (Author)

23290 (CONF-921276–, pp. 147-150) **Thermal response of low heat loss thermal insulation pipe for cyclic temperature fluctuation.** Doi, T. (Electrotechnical Laboratory, Tsukuba (Japan)); Takashima, T.; Tanaka, T.; Fujii, T.; Kamoshida, J. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Supposing that the radiant quantity of sunlight fluctuates, respondency to temperature was both numerically and simplifiedly analyzed of thermal insulation pipe (TIP) made of insulating material only against the cyclic fluctuation in temperature. For the pipe system analysis modeling, selection was made of both conventional ordinary insulation pipe (OIP) which is a metallic pipe externally covered with insulating material and TIP which is made of insulating material only without metallic material. In the numerical analysis, basic formula of energy was obtained in the non-steady state of both fluid and insulating material, while for the response to temperature, investigation was made on the gain and phasic differential of fluid temperature at the inlet. It was known that the TIP is nearly equal to the perfect TIP in respondency to temperature with a quicker transfer of temperature differential from the inlet to the outlet than that in the OIP, and that the damping is small in amplitude of temperature differential. The TIP is larger in gain and small in phasic differential than the OIP so that the former is better in respondency to temperature. As a result of comparing the analytical solution with the numerical solution which was obtained by simplifying the basic formula of TIP for the respondency to temperature, both solutions agreed with each other in tendency of gain and phasic differential itself. 3 refs., 6 figs.

23291 (CONF-921276–, pp. 243-246) **Developing solar collecting system condensing and transmitting a large capacity of solar energy. 1st Report.** Furuune, H. (La Foret Engineering Co. Ltd., (Japan)); Yokota, J.; Hara, K.; Takahashi, K.; Koizumi, F. 3 Dec 1992. 305p. (In Japanese). This paper describes development of a large-capacity solar collecting system using fresnel lens collection and optic fiber transmission. The fresnel lens has a regular hexagonal shape and a focal distance of 128 mm (72 cm^2). One hundred ninety six of the lenses were arranged densely to make a panel with a total light receiving area of 1.4 m^2. Each lens is connected at its focal point with an input terminal of the single-core optic fiber to collect the solar rays. The core for the optic fiber is made of quartz glass, and the fiber is clad with transparent fluorine resin cladding. The transmitted outgoing rays were visible rays nearly close to the solar rays. Setting the optic fibers at the focal points of the visible rays resulted in reduced ultraviolet and infrared rays. While the amount of outgoing light varies with the sun's latitude and air masses, an amount of about 30,000 lm can be obtained when the direct solar radiation is assumed at 80,000 lx and the transmission efficiency at 20% to 30%. The present system which has the light collecting and transmission efficiency of 25% can deliver a transmitted light of 250 W when the insolation is 700 W/m^2. 4 refs., 7 figs., 2 tabs.

This paper describes simulations of performance of a solar heating system with thermal core type soil heat storage. The system combines a thermal core consisting of a water tank and crushed

stones with soil surrounding the water tank as the heat storage media to recover heat for an extended or limited period of time. Solar heat thus stored is used as a heat source for floor-type room heating and heat pumps using air as a heat source, and then recovered. Efficiency for solar heat collection and soil heat storage is higher with the shorter heat storing period, but on the other hand this condition leads to more intensive heat pump operation because of insufficient temperature rise in the heat storage tank, thus the COP for room heating decreases. Conversely in a long period heat storage, the heat collection performance falls but the room heating efficiency rises. The larger the tank capacity, the more the solar heat collection and storage efficiency increases, but the room heating COP decreases. A preferable shape for the soil heat storage is such that the area of contact with the soil can be made as large as possible and can suppress heat loss from the ground surface around the tank. While this system was verified effective, a balance between the solar heat collection performance and the room heating efficiency, contradicting with each other, is a critical requirement for the system design. 3 refs., 8 figs.

23293 (CONF-921276–, pp. 187-190) **Study on optimization of the system parameter of the ground thermal storage in the greenhouse.** Nakahara, N. (Nagoya University, Nagoya (Japan)); Zheng, M. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. This paper presents simulation numerical models for vegetable cultivating greenhouses that operate on solar energy stored in soil. The models are intended to deal with a condition with vegetables existing in a greenhouse. Greenhouse environment simulation models were built according to heat and water balance in various parts of the greenhouse. The result was 31 simultaneous equations. As a result of inducing and introducing analysis solutions for insolation and long-wave radiation to decrease the calculation time, the number of equations was decreased to six. A condition with plants present in the greenhouse produces more steam from the plants in day time than the case without plants, increasing the latent heat storage ratio. During night-time heat dissipation, the steam pressure in the room is kept higher than that in the duct, thus no water can evaporate from the duct, and sensible heat dissipation becomes predominant. For the switching on-off control according to room temperatures, the rate of solar heat utilization as a result of using the ducts is 10% to 35%, which increases as the set temperature reduces. The result coefficient is 2.1 to 5.3. If added with compound control with the air temperature difference at the duct inlet and outlet set at 0.5°C or higher, the result coefficient becomes constant at about 2.42. 2 refs., 2 figs., 5 tabs.

23294 (CONF-921276–, pp. 191-194) **Basic investigation on solar thermochemical heat storage and temperature history of reactant pellet under dehydration.** Fujii, I. (Meiji University, Tokyo (Japan)); Akiyama, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

This paper describes a basic investigation on solar heat storage using thermochemical reaction of dehydration/hydration in Ca(OH)2. Solar rays reflected on a solar ray collector heat the outer surface of a vertical heating tube with an inner diameter of 12 mm. The tube is filled with spherical Ca(OH)2 pellets with a diameter of 10 mm, which drop down in the tube with their dropping speed so adjusted as to complete dehydration before reaching the tube end. The dehydrated pellets are exposed to steam, as required, to recover and utilize heat generated from hydration heat generating reaction, and then reused. To prevent the pellets from breakdown, Ca (OH)2 was filled into cavity in foamed metal formed spherical. Temperature behavior of the spherical pellets was investigated during the dehydration. When calculated theoretically assuming the biot number to be 0.4, the temperature change in the pellets agreed well with the experimental values. The pellets required 25 minutes before completely dehydrated. While a passing time of 30 minutes suffices for dehydration when the heating tube temperature is 600°C, decreasing the dehydration time requires to increase the amount of surface radiation heating. 4 refs., 9 figs., 2 tabs.

This handbook is one of a series that was recently written or updated for persons involved in the development of generating plants that use renewable resources. Other siting handbooks cover facilities powered by geothermal, hydro, and biomass resources. These handbooks are intended to introduce the reader to the regulations and their corresponding institutions that affect the development of physical facilities. The handbooks, for the most part, apply to resource development in the Pacific Northwest, i.e., Oregon, Washington, Idaho, and Western Montana. Some states have their own development or siting handbooks. These may be identified and obtained by contacting the states' energy offices.

The Ahuachapan Geothermal Field (AGF) is a 90 megawatt geothermal-sourced powerplant operated by the Comision Ejecutiva Hidroelectrica del Rio Lempa (CEL) of El Salvador. During the period November 1987 through May 1988 a deep resistivity survey and technology transfer was performed at the AGF at the request of Los Alamos National Laboratory (LANL) as part of a United States Agency for International Development (USAID) project. The resistivity surveying is ongoing at the time of this report under the supervision of CEL personnel. LANL and contract personnel were present at the site during performance of the initial surveying for

the purpose of technology transfer. This report presents the results and interpretation of the two initial resistivity survey lines performed on site during and shortly after the technology transfer period.

The actual geothermal exploration and development may appear to be a simple and straightforward process in comparison to the legal and institutional maze which the developer must navigate in order to obtain all of the federal, state, and local leases, permits, licenses, and approvals necessary at each step in the process. Finally, and often most difficult, is obtaining a contract for the sale of thermal energy, brine, steam, or electricity. This guide is designed to help developers interested in developing geothermal resource sites in the Bonneville Power Administration Service Territory in the state of Idaho, Montana, Oregon, and Washington better understand the federal, state, and local institutional process, the roles and responsibilities of each agency, and how and when to make contact in order to obtain the necessary documents.

1505 Economic, Industrial, and Business Aspects

23299 (DOE/BP–2013) **Economic impacts of geothermal development in Whatcom County, Washington.** Lesser, J.A. Washington State Energy Office, Olympia, WA (United States). Jul 1992. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-90BP08317. Order Number DE93012375. Source: OSTI; NTIS; INIS; GPO Dep.

This report estimates the local economic impacts that could be anticipated from the development of a 100 megawatt (MW) geothermal power plant in eastern Whatcom County, Washington, near Mt. Baker, as shown in Figure 1. The study was commissioned by the Bonneville Power Administration to quantify such impacts as part of regional confirmation work recommended by the Northwest Power Planning Council. Whatcom County was chosen due to both identified geothermal resources and developer interest. The analysis will focus on two phases: a plant construction phase, including well field development, generating plant construction, and transmission line construction; and an operations phase. Economic impacts will occur to the extent that construction and operations affect the local economy. These impacts will depend on the existing structure of the Whatcom County economy and estimates of revenues that may accrue to the county as a result of plant construction, operation, and maintenance. Specific impacts may include additional direct employment at the plant, secondary impacts from wage payments being used to purchase locally produced goods and services, and impacts due to expenditures of royalty and tax payments received by the county. The basis for the analysis of economic impacts in this study is the US Forest Service IMPLAN input-output modeling system.

23300 (DOE/BP–2014) **Economic impacts of geothermal development in Skamania County, Washington.** Lesser, J.A. Washington State Energy Office, Olympia, WA (United States). Jul 1992. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-90BP08317. Order Number DE93012373. Source: OSTI; NTIS; INIS; GPO Dep.

This report estimates the local economic impacts that could be anticipated from the development of a 100 megawatt (MW) geothermal power plant in eastern Skamania County, Washington, near Mt. Adams, as shown in Figure 1. The study was commissioned by the Bonneville Power Administration to quantify such impacts as part of regional confirmation work recommended by the Northwest Power Planning Council. Skamania County was chosen due to both identified geothermal resources and developer interest. The analysis will focus on two phases: a plant construction phase, including well field development, generating plant construction, and transmission line construction; and an operations phase. Economic impacts will occur to the extent that construction and operations affect the local economy. These impacts will depend on the existing structure of the Skamania County economy and estimates of revenues that may accrue to the county as a result of plant construction, operation, and maintenance. Specific impacts may include additional direct employment at the plant, secondary impacts from wage payments being used to purchase locally produced goods and services, and impacts due to expenditures of royalty and tax payments received by the county. The basis for the analysis of economic impacts in this study is the US Forest Service IMPLAN input-output modeling system.

23301 (DOE/BP–07129-3) **Economic impacts of geothermal development in Malheur County, Oregon.** Sifford, A.; Beale, K. Oregon State Dept. of Energy, Salem, OR (United States). Jan 1993. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-90BP07129. Order Number DE93011648. Source: OSTI; NTIS; INIS; GPO Dep.

This study provides local economic impact estimates for a 100 megawatt (MW) geothermal power project in Oregon. The hypothetical project would be in Malheur County, shown in Figure 1. Bonneville Power Administration commissioned this study to quantify such impacts as part of regional confirmation work recommended by the Northwest Power Planning Council and its advisors. Malheur County was chosen as it has both identified resources and industry interest. Local economic impacts include direct, indirect, and induced changes in the local economy. Direct economic impacts result from the costs of plant development, construction, and operation. Indirect impacts result from household and local government purchases. Induced impacts result from continued responding as goods and services to support the households and local governments are purchased. Employment impacts of geothermal development follow a pattern similar to the economic impacts. Public service impacts include costs such as education, fire protection, roads, waste disposal, and water supply. The project assumption discussion notes experiences at other geothermal areas. The background section compares geothermal with conventional power plants. Power plant fuel distinguishes geothermal from other power sources. Other aspects of development are similar to small scale conventional thermal sources. The process of geothermal development is then explained. Development consists of well drilling, gathering system construction, power plant construction, plant operation and maintenance, and wellfield maintenance.

1508 Geothermal Power Plants

23302 (LA-UR–93-735) **Next stages in HDR technology development.** Duchane, D.V. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930186–1: EPRI workshop on potential of HDR resources for the U.S. Electric Utility Industry, Philadelphia, PA (United States), 14 Jan 1993). Order Number DE93008719. Source: OSTI; NTIS; GPO Dep.

Twenty years of research and development have brought HDR heat mining technology from the purely conceptual stage to the establishment of an engineering-scale heat mine at Fenton Hill, NM. In April 1992, a long-term flow test (LTFT) of the HDR reservoir at Fenton Hill was begun. The test was carried out under steady-state conditions on a continuous basis for four months, but a major equipment failure in late July forced a temporary suspension of operations. Even this short test provided valuable information and extremely encouraging results as summarized below: There was no indication of thermal drawdown of the reservoir. There was evidence of increasing access to hot rock with time. Water consumption was in the rangki of 10–12%. Measured pumping costs were $0.003 per kilowatt of energy produced. Temperature logs conducted in the reservoir production zone during and after the flow test confirmed the fact that there was no decline in the average temperature of the fluid being produced from the reservoir. In fact, tracer testing showed that the fluid was taking more indirect

pathways and thus contacting a greater amount of hot rock as the test progressed. Water usage quickly dropped to a level of 10–15 gallons per minute, an amount equivalent to about 10–12% of the injected fluid volume. At a conversion rate of 10–15%, these would translate to effective "fuel costs" of 2–3¢ per kilowatt hour of electricity production potential. The completion of the LTFT will set the stage for commercialization of HDR but will not bring HDR technology to maturity. Relatively samples extensions of the current technology may bring significant improvements in efficiency, and these should be rapidly investigated. In the longer run, advanced operational concepts could further improve the efficiency of HDR energy extraction and may even offer the possibility of cogeneration schemes which solve both energy and water problems throughout the world.

23303 (LA-UR–93-910) **Expectations for a second US Hot Dry Rock Site.** Duchane, D.V. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930186–2: EPRI workshop on potential of HDR resources for the U.S. Electric Utility Industry, Philadelphia, PA (United States), 14 Jan 1993). Order Number DE93010707. Source: OSTI; NTIS; GPO Dep.

The worlds first hot dry rock (HDR) reservoir was created at Fenton Hill, NM in the late 1970's. Today, Fenton Hill is the site of the largest, deepest, and hottest HDR reservoir. Over the past two decades, HDR systems have also been developed in a number of other countries. However, HDR reservoirs to date have always been created as part of research and development programs aimed at understanding the fundamentals of HDR technology. The time has come to begin planning the construction of a commercial-scale facility which will show the world that HDR can be a practical source of power. The second domestic HDR facility should demonstrate that commercial production of energy from HDR is feasible at a variety of locations. Day-today operating data should provide the cost figures needed in order to unambiguously design and build future commercial HDR power production plants. Successful construction and operation of the second HDR plant will both supply needed electric power at competitive costs and set the stage for the widespread application of HDR technology both domestically and throughout the world. If preliminary work is begun promptly, it should be possible to develop a fully operational second site by 1997. The Clearlake region of northern California may be an ideal area in which to locate the second HDR site.

23304 (CONF-921276–, pp. 267-270) **Potential wind energy resources in the kinki district: Results of survey.** Shinohara, M. (The Kansai Electric Power Co. Inc., Osaka (Japan)); Ueda, M.; Tada, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

To engineer the wind power generation plan, a potential wind energy map in the Kinki District was prepared by computation from meteorological data collected by the AMeDAS and Kansai Electric Power. In the conventional lkm-mesh data on monthly mean wind velocity, the wind velocity had tended to be underestimated in the large altitude places, at the summits and on the ridges. Therefore, heightening was engineered in accuracy of wind velocity presumption by collecting data as many as possible in the mountainous regions. To presume the mean wind velocity, regression was multiply made by using topographical terrain factors. In case the frequency distribution of wind velocity forms a Weibull one, the monthly mean wind velocity if given determines the different quantities necessary for computing the energy density in that case, which enables computation of the monthly mean wind energy (monthly mean energy density (W/m_2) of wind passing the unit sectional area during the unit time). 500m×500m-mesh magnitudes of potential wind energy were shown by color on the map. Regions in which higher monthly mean wind velocity than 6m/s (or 4m/s) could be expected were extracted as candidate regions for the wind power generation. 3 figs.

This presentation will summarize the present state of knowledge on slope and valley wind systems, emphasizing physical concepts and recent gains in understanding from observational programs in various parts of the world. The presentation will begin with a discussion of terminology and a summary of the characteristics and relevant physics of slope and valley wind systems. The interrelationships between slope and valley wind systems will be covered as well as the cyclical development of the wind systems during the morning transition, daytime, evening transition, and nighttime periods. The discussion will focus on key physical factors including topography, temperature structure, surface energy budgets, atmospheric heat budgets, strength of overlying flows, etc. that produce variations in wind system behavior from one topographic and climatic setting to another. Deviant wind system behavior and winds associated with special topographic features will also be discussed.

23306 (Riso-R–683(EN), pp. 23-26) **Are feasibility studies reliable at high wind energy penetration levels.** Hansen, J.C. (Dept. of Meteorology and Wind Energy, Risoe National Laboratory, Roskilde (Denmark)); Tande, J.O.G. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Mar 1993. (CONF-930315–: ECWEC'93. European community wind energy conference and exhibition, Travemuende (Germany), 8-12 Mar 1993). Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

Many power systems around the world show economic prospects for introducing wind energy to high penetration levels. Few actual high wind energy penetration systems have been built and decisions to fund such projects have to be taken based on feasibility studies including power system modelling. This paper compares the validity of feasibility studies of high wind energy penetration projects with studies for wind energy penetration at the level of "traditional" grid connected wind farms. Differences in study techniques and possible reasons for investors scepticism towards high wind energy penetration systems are identified. By dividing uncertainties in (a) those always present in wind power projects and (b) those special for high wind energy penetration systems, real differences in project risks and uncertainties appear. The case of the capital of the Republic of Cape Verde is considered. Feasibility study uncertainties elements for high and low penetration levels are identified and quantified for the simple case excluding capacity value of wind power. Sensitivity analyses are performed. For the case studied, the uncertainty in the cost og wind energy is practically independent of the wind energy penetration level and dominated by uncertainties in wind resource predictions. (au).

Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

In this paper it is shown that for a large scale electricity supply grid with a significant penetration of wind power, fossil fuel savings could be increased by up to 25% by using intelligent forecasts of wind energy production. Wind speed forecasts are made using numerical weather prediction models combined with either a physical or a statistical model taking local microscale effects into account. The forecasts are used in conjunction with a time series model which simulates the scheduling of power plant in the England and Wales electricity supply grid. Results are shown in the form of fossil fuel savings for different forecasting methods and, in addition, show the benefits of using wind speed forecasting errors to help conventional plant scheduling. (au).

23309 (CONF-921276--, pp. 271-274) **Study of small wind turbine generation system for extreme weather condition.** Seki, K. (Tokai University, Tokyo (Japan). Research and Development Institute); Shimizu, Y.; Takanaga, T.; Okura, R.; Otani, I. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Solar cell generator-combined small wind turbine generation system was investigated for the use in high mountain regions, particularly Himalaya, Tenzan and Mongolia. Though anxiety is unnecessary about sticking of snow and ice to the blade, the temperature is rather lower than that in the Antarctic Base so that the cold resistant design is necessary against the lower temperature then -60 centigrade. The occurrence frequency of wind velocity from 10 to 20m/s is as high as 50% so that the design was conditioned by the wind velocity of 33m/s. The highest momentary wind velocity of 100m/s must be taken into consideration. The occurrence frequency of wind is 62% in its directional range between the north-west by west and south-west by west. As the environmental condition is severe, the structure was simplified and importance was attached to the stability with a fixation of yaw and pitch. The output power is 150W at 20m/s in wind velocity and the highest one is 500W at 30 m/s in it. The largest number of revolutions per minute was made resistant to 90m/s in wind velocity. Two rotors which were 1.05m in diameter and different in material were made of Al and GFRP. The performance as expected was obtained in the wind tunnel test. For the consistency between the generator and wind turbine, importance was attached to the stability even by sacrificing the wind turbine performance. The optimized pitch angle was about 22.8°. 2 refs., 10 figs., 1 tab.

23310 (EEV--93-01) **Windmill gearboxes: Reported damage 1987 - 1992.** Fisker, J. Danske Elvaerkers Forenings Udredningsafdeling (DEFU), Lyngby (Denmark). Apr 1993. 22p. (In Danish). Contract ENS-1364/91-0008. Order Number DE93794762. Source: OSTI; NTIS.

EFP-91.

Reports of damages or operational disturbances etc. with regard to the gearboxes of size 55 kW - 2000 kW windmills in Denmark were registered and analyzed in order to determine which components or designs should be improved in order to minimize future damage. A detailed survey is given of the various types of damage, and the possible causes are discussed. Suggestions of actions to take in order to avoid damage to parts of wind turbine gear cases are detailed. A method for calculating resistance to pitting corrosion at high operational temperatures is proposed. (AB).

23311 (NEI-DK--1159) **Environmental measurements - External noise. "Windflower", Denmark.** Jensen, H. Acoustica A/S, Glostrup (Denmark); Carl Bro Gruppen, Glostrup (Denmark). Feb 1993. 13p. (In Danish). Contract ENS-51171-91.0043. Order Number DE93794749. Source: OSTI; NTIS.

Results are given of the measurements and following calculations carried out, in relation to the Danish Ministry of the Environment's Executive order no. 304, on the Danish-produced wind turbine "Windflower" 4kW. The noise effect level was LWA, ref = 73,7 dB(A), ref 1 pW. Uncertainty was +- 2 dB(A). The noise in the measuring position contains clear cut tone areas around 550Hz. (AB).

23312 (Riso-R--683(EN)) **Contributions from the Department of Meteorology and Wind Energy to the ECWEC'93 conference in Travemuende, Germany.** Lundtang Petersen, E. (ed.). Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

In this paper an experiment for obtaining a 10 second forecast of the one second average output wind turbine power is described. Measured time series of one second averages of corresponding values of wind speed, wind direction and output wind turbine power are considered, and two different neural network multilayer backpropagation network (MBPN) models for providing a continuous 10 second forecast of the one second average output power are described and evaluated. The models are tested on real time series, and the results are presented and analyzed. The results of applying the different MBPN models are evaluated against each other and against a simple persistence model assuming the output power to remain constant within the forecast period. The paper indicates the usability of neural networks for short-term forecasting of wind power, and it concludes with a ranking of the different models in terms of their estimated confidence level. (au).

23314 (Riso-R–683(EN), pp. 9-14) **A theoretical and experimental investigation of new tip shapes.** Antoniou, I. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

Aerodynamic noise has become one of the main issues which the wind turbine industry must deal with at the present time. One of the most important sources of aerodynamic noise from wind turbines is the blade tip region, which also affects the aerodynamic characteristics of the rotor. This paper presents preliminary results from ongoing tests conducted for a series of different tip shapes. The selection of the different shapes has mainly been based on a literature survey and results from helicopter rotors. The tests comprise load and inflow measurements, noise measurements and flow visualization recordings. A 100 kW wind turbine Tellus T-1995 is used as a test bed. The results from the different tips are to be compared to those of the rotor's standard tip. The experimental setup is presented together with load and preliminary noise measurement results. The merits and problems of the noise measurement technique adopted are also discussed. (au) (13 refs.).

23315 (Riso-R–683(EN), pp. 15-18) **Active pitch control: The controllers influcence on performance and loads of a wind turbine.** Bindner, H. (Test Station for Wind Turbines, Risoe National Laboratory (Denmark)); Madsen, P.H.; Andersen, K.; Thomsen, K.E. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Mar 1993. (CONF-930315–: ECWEC'93. European community wind energy conference and exhibition, Travemuende (Germany), 8-12 Mar 1993). In *Contributions from the Department of Meteorology and Wind Energy to the ECWEC'93 conference in Travemuende, Germany.* 73p. Order Number DE93794693. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The paper presents a model suitable for controller design and analysis primarily for the design of pitch controllers. The scope of the model is to be able to predict the performance of a pitch controlled turbine and to give information on loads in the drive train. Results regarding model complexity and the impact of key parameter variation are presented. (au).

23316 (Riso-R–683(EN), pp. 19-22) **Application of a general purpose navier-stokes code to wind turbine flow problems.** Madsen, H.A. (The Test Station for Wind Turbines, Risoe National Laboratory, Roskilde (Denmark)); Rasmussen, F. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Mar 1993. (CONF-930315–: ECWEC'93. European community wind energy conference and exhibition, Travemuende (Germany), 8-12 Mar 1993). In *Contributions from the Department of Meteorology and Wind Energy to the ECWEC'93 conference in Travemuende, Germany.* 73p. Order Number DE93794693. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The complex nature of the aerodynamics of wind turbines requires the use of advanced, state-of-the-art computational tools. The fast growth of computing power on e.g. work stations combined with the development of new iterative solvers for large matrix systems has now made Navier Stokes calculations realistic and efficient operational tool. At RISOe Navier-Stokes calculations have now been used for some time on different wind turbine flow problems. The present paper presents results on the 2D flow over an airfoil in stall and results on the steady and unsteady flow through an actuator disc which is equivalent to the dynamic inflow problem for wind turbines. (au).

23317 (Riso-R–683(EN), pp. 27-30) **Engineering design tools for wind diesel systems: Presentation and validation of the logistic modelling package.** Infield, D.G. (ERU, RAL, Oxon (United Kingdom)); Scotney, A.; Lundsager, P.; Bindner, H.; Uhlen, K.; Toftevaag, T.; Manninen, L.; Falchetta, M.; Dijk, V. van. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Mar 1993. (CONF-930315–: ECWEC'93. European community wind energy conference and exhibition, Travemuende (Germany), 8-12 Mar 1993). The paper presents some of the results of a common effort between Risoe, ECN and Garrad Hassan, supported by JOULE 1 (and for GH partly funded by the UK Department of Trade and Industry), with the aim to clarify the physical phenomena, identify the important parameters for the occurrence of stall induced vibrations and set up necessary restrictions and design guidelines for larger turbines. (au).

23321 (Riso-R–683(EN), pp. 49-52) **The importance of a good wind year to start on when building a wind farm.** Frandsen, S. An analysis of the influence of long-term variations in annual mean wind speed on the economy of a wind power plant has be carried out, using one British and one Danish time series of wind speed extending 90 years back. The analysis shows that even if the long-term average wind speed is known precisely, natural variations in wind speed makes the final wind power plant economy a function of the year in which the project is initialized. Such variations cannot be predicted and must be treated as an uncertainty. Employing the two series of annual mean wind speeds, cost of energy was found to vary as much as ± 13% from an arbitrarily chosen mean value of 0.40 DKK/kWh. (au).

23322 (Riso-R–683(EN), pp. 53-56) **Turbulence in windfarms.** Hoejstrup, J. (Department of Meteorology and Wind Energy, Risoe National Laboratory, Roskilde (Denmark)); Courtney, M.S. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Mar 1993. (CONF-930315–: ECWEC'93. European community wind energy conference and exhibition, Travemuende (Germany), 8-12 Mar 1993). In *Contributions from the Department of Meteorology and Wind Energy to the ECWEC'93 conference in Travemuende, Germany.* 73p. Order Number DE93794693. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

Turbulence data from three windfarms in flat and mountaneous terrain types are presented. Turbulence properties are presented in the form of covariances, spectra and probability distributions. Standard deviations and shear stresses in the windfarm are far from their wellknown equilibrium values. Velocity spectra are strongly influenced by scales of sizes comparable to the diameter of the wake. Probability distributions do not differ much from turbulence in general, they exhibit the same non-Gaussian behaviour as the undisturbed free stream turbulence. (au) (12 refs.).

Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The paper presents preliminary results of the Portuguese participation in "Wind Measurement and Modelling in Complex Terrain", a multi-partner project supported by the European Community within the JOULE Programme. The activities described here were carried out by the University of Porto, Faculty of Engineering. The research programme aims at improving the present knowledge of the wind resource in regions of Portugal with complex topography. Upon the selection of relevant areas to be studied in detail, a total of ten meteorological masts were installed and are in operation since July 1991. The wind data collected until now has been processed and summary results are presented, comprising the mean wind speed and power density (at 10 m a.g.l.), the maximum recorded 10 min average and the maximum gust (3 sec. average). The report includes detailed information on the sites that are being studied, an updated summary of the recorded wind characteristics for all stations and sample preliminary results of the application of WAsP. (au).

The European Wind Atlas was produced with the purpose of establishing the meteorological basis for the assessment of wind resources in the European Community. The comprehensive guidelines and computational tools which were generated together with the Atlas have constituted the basis for a number of similar studies outside the Community thereby making the calculated power production from wind turbines comparable from one country to another. The Atlas depicts through maps and tables the regional distribution of the wind resources over land, and a recent study has presented an offshore wind resource map. It appears from the Atlas that areas potentially suitable for wind energy applications are dispersed throughout all the countries of the European Community. The Commission has initiated measurements under the Joule 1 program in Northern Portugal, Spain, Italy, Greece and Ireland. This will add significantly to our understanding of the local distribution of the wind resources in mountainous terrain and thereby help to improve the model for flow over hills. Recently a comprehensive study based on wind and wave observations from commercial ships was undertaken by Deutsche Wetterdienst - Seewetteramt, Hamburg. A carful comparison between the Wind Atlas predictions and the ship statistics can be used to rank a number of near-coastal stations in the Wind Atlas. (AB).

23325 (Riso-R–683(EN), pp. 69-72) **Wind resources, part 2: Calculational methods.** Mortensen, N.G. (Meteorology and Wind Energy Department, Risoe National Laboratory, Roskilde (Denmark)); Petersen, E.L.; Landberg, L. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Mar 1993. (CONF-930315–: ECWEC'93. European community wind energy conference and exhibition, Travemuende (Germany), 8-12 Mar 1993). The Wind Atlas Analysis and Application Program represents one of several calculational methods or tools that are used routinely in the analysis of wind data and estimation of wind resources. Based on the experience gathered at Risoe it is concluded that the program works very well in relatively uncomplicated topography. Less is known about the performance in mountainous terrain, but it is concluded that high-quality wind and topographical data, as well as great attention to detail, are a prerequisite to the successful application of such models in complex terrain. A case study, using data from an ongoing measuring campaign in very complex terrain in Northern Portugal, is used to illustrate from an ongoing measuring campaign in very complex terrain in Northern Portugal, is used to illustrate the capabilities and limitations of current models. 23326 (ANL–92/2-Vol.1) **COMMIX-PPC: A three-dimensional transient multicomponent computer program for analyzing performance of power plant condensers: Volume 1, Equations and numerics.** Chien, T.H.; Domanus, H.M.; Sha, W.T. Argonne National Lab., IL (United States). Feb 1993. 121p. DOE Contract W-31109-ENG-38. Order Number DE93012174. Source: OSTI; NTIS; INIS; GPO Dep.

The COMMIX-PPC computer pregrain is an extended and improved version of earlier COMMIX codes and is specifically designed for evaluating the thermal performance of power plant condensers. The COMMIX codes are general-purpose computer programs for the analysis of fluid flow and heat transfer in complex Industrial systems. In COMMIX-PPC, two major features have been added to previously published COMMIX codes. One feature is the incorporation of one-dimensional equations of conservation of mass, momentum, and energy on the tube stile and the proper accounting for the thermal interaction between shell and tube side through the porous-medium approach. The other added feature is the extension of the three-dimensional conservation equations for shell-side flow to treat the flow of a multicomponent medium. COMMIX-PPC is designed to perform steady-state and transient. Three-dimensional analysis of fluid flow with heat transfer tn a power plant condenser. However, the code is designed in a generalized fashion so that, with some modification, it can be used to analyze processes in any heat exchanger or other single-phase engineering applications. Volume I (Equations and Numerics) of this report describes in detail the basic equations, formulation, solution procedures, and models for a phenomena. Volume II (User's Guide and Manual) contains the input instruction, flow charts, sample problems, and descriptions of available options and boundary conditions.

23327 (ANL/MCT/CP–79047) **Corrosion performance of materials in coal-combustion environments.** Natesan, K. Argonne National Lab., IL (United States). Materials and Components Technology Div. Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305135–2: 7. annual conference on fossil energy materials, Oak Ridge, TN (United States), 11-13 May 1993). Order Number DE93012904. Source: OSTI; NTIS; GPO Dep.

Reliability of components and long-term trouble-free performance of structural materials are essential for the acceptance of power-generating process that utilize coal as a feedstock- The combustion environments encompass a wide range of oxygen partial pressures, from excess-air conditions in conventional systems to air-deficient conditions in low-NO_x systems. Apart from the environmental aspects of the effluent from coal combustion, one of the concerns from the systems standpoint is the aggressiveness of the combustion environment toward the boiler structural components such as waterwall tubes and steam superheaters. The corrosion tests in this program address the combined effect of sulfur and chlorine on the corrosion response of several ASME-coded and noncoded boiler materials exposed to air-deficient and excess-air combustion conditions. Thermodynamic calculations were made to evaluate the gas chemistries that will arise from combustion of coals. The results of such calculations, coupled with oxygen-sulfur-chlorine thermochemical diagrams, were used to select gas environments for the laboratory test program. Tests were conducted at 400 and 650°C to stimulate the waterwall and superheater environments, respectively, in pulverized-coal-fired boilers. Experimental results obtained thus far indicate that both sulfur and chlorine can accelerate corrosion of ferritic and austenitic alloys; in addition, the protective capacity of the oxide scale in resisting further corrosion seems to degrade in the presence of both sulfur and chlorine.

23328 (DOE/CE/40860–1) **High performance steam systems (HPSS): Mechanical drive market assessment: Final report.** RCG/Hagler, Bailly, Inc., San Francisco, CA (United States). Oct 1991. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90CE40860. Order Number DE93014858. Source: OSTI; NTIS; GPO Dep.

RCG/Hagler, Bailly, Inc. (RCG/HBI) was retained to investigate the potential market for the high performance steam system (HPSS) in mechanical drive applications in the US industrial sector. To conduct this assessment, we undertook several activities including: (1) Identifying and characterizing the steam turbine mechanical drive market in the US industrial sector. (2) Characterizing the mechanical drive requirements by application within each industrial sector. (3) Identifying key factors and criteria used in the selection and sizing of mechanical drive systems for each industry. (4) Estimating the population of existing facilities by industry and the resulting number. of steam turbine mechanical drives. (5) Forecasting the growth by industry and resulting new market for steam turbine mechanical drives. (6) Conducting a comparative economic evaluation of HPSS mechanical drives versus conventional steam generator and steam turbine mechanical drive systems. Steam turbine mechanical drives in the industrial sector are found in several typical applications including: Compressors, Blowers, or Pumps. Steam turbine mechanical drives are found in other applications including chippers, grinders, and paper machines such as in the pulp and paper industry. Typically, large industrial plants operate a number of in steam distribution systems at different pressures and temperature. Numerous steam turbines and process applications are operated off any given steam distribution system. Higher pressure steam is typically used to run large steam turbine mechanical drive and generator units, whereas the lower pressure steam is used to drive smaller steam turbines (including those below 1,000 hp) and for low temperature heating applications such as V= heating or process heating.

23329 (DOE/MC/29234–3364) **Advanced Turbine System (ATS): Task 1, System scoping and feasibility study: Final report.** van der Linden, S. ABB Power Generation, Inc., North Brunswick, NJ (United States). Turbine Power Div. Feb 1993. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29234. Order Number DE93000280. Source: OSTI; NTIS; GPO Dep.

Present GT(Gas Turbine) Systems are available to achieve 52% (LHV) thermal efficiencies, plants in construction will be capable of 54%, and the goal of this study is to identify incentives, technical issues, and resource requirements to develop natural gas-and coal-compatible ATS which would have a goal of 60% or greater based on LHV. The prime objective of this project task is to select a natural gas-fired ATS (Advanced Turbine System) that could be manufactured and marketed should development costs not be at issue with the goals of: (1) Coal of electricity 10% below 1991 vintage power plants in same market class and size. (2) Expected performance 60% efficiency and higher, (3) Emission levels, NO_x < 10 ppM (0.15 lb/MW-h), CO < 20 ppM (0.30 lb/MW-h), and UHC < 20 ppM (0.30 lb/MW-h). ABB screening studies have identified the gas-fueled combined cycle as the most promising full scale solution to achieve the set goals for 1988–2002. This conclusion is based on ABB's experience level, as well as the multi-step potential of the combined cycle process to improve in many component without introducing radical changes that might increase costs and lower RAM. The technical approach to achieve 60% or better thermal efficiency will include increased turbine inlet temperatures, compressor intercooling, as well a improvements in material, turbine cooling technology and the steam turbine. Use of improved component efficiencies will achieve gas-fired cycle performance of 61.78%. Conversion to coal-firing will result in system performance of 52.17%.

23330 (DOE/PC–93007525, pp. 4-11) **Combustion 2000: Planning and procuring an engineering development program.** USDOE Pittsburgh Energy Technology Center, PA (United States). 1993. In *PETC Review: Issue 7, Winter 1992–1993*. 52p. Order Number DE93007525. Source: OSTI; NTIS.

The previous six issues of the PETC Review presented a number of fossil energy research and development (R&D) efforts. In general, these projects are part of various Federal research programs and are either fully Federally funded or cost-shared. But how is a Federal program conceived and implemented? How does the Government determine what type of solicitation will be used to obtain proposals for implementing the program? Combustion 2000 is a long-term, cost-shared, Federally funded R&D effort that will help advance coal-fired power generation technology into the 21st century. Although PETC has long been involved in 'in-house' combustion research, this program was to be performed by industry. Because it is a good example of Federally funded engineering development work that will help move advanced combustion technologies into the commercial marketplace in the future, the author has chosen the Combustion 2000 program to illustrate the procurement process. 8 figs.

23331 (NEDO-P–9119) **Technology to make waste RDF and study of its applicability to the power generation system. 2.**

New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 168p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794622. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

A survey is made on RDF technology, and evaluation study is made on technology to apply the RDF to the power generation system in view of economy and sociality. In case of cocombustion, it is important to grasp probability of combustion conditions, critical conditions for tube corrosion, and characteristics of combustion flue gas and combustion ash, while, in case of RDF combustion, it is important to grasp characteristics of desulfurization, desalination, etc. Further, it is needed to make bench tests, pilot tests and incineration tests by boiler. On the assumption that RDF transportation cost and ash disposal expense are burdened by a production side, the cost of power generation is estimated. The cost of equipment in case of applying RDF to a large coal-fired plant will be considerably large, and it is difficult to cover it by saving the cost of coal at an RDF cocombustion ratio less than 2% (about 300 tons/day refuse treatment volume). At RDF combustion plants, the cost of power generation will not reach the current power selling price level of the refuse fuel power generation unless its output reaches about 100MW (2000 tons/day refuse treatment volume). 9 refs., 47 figs., 39 tabs.

23332 (NEI-FI-203) **Black liquor gasification gas cleanup: Final report.** Salmenoja, K.; Mojtahedi, W. Tampella Power, Tampere (Finland). 1992. 32p. Order Number DE93794809. Source: OSTI; NTIS.

JALO Research Programme.

Integrated Gasification Combined-Cycle (IGCC) power generation is being investigated as an attractive alternative to conventional steam cycle power plant technology. In an IGCC system, the organic matter in black liquor is converted to a clean gaseous fuel suitable for combustion in a gas turbine. The inorganic products are recovered as green or white liquors to be circulated and reused. The product gas from black liquor gasification contains sulfur gases, particulates and alkali metal compounds in the aerosol form as well as in the vapour phase. All these have to be removed or their concentrations reduced to very low levels for the gas to be acceptable to the gas turbine and also to comply with environmental regulations. Moreover, alkali and sulfur have to be recovered for reuse in the pulping process. Gasification of black liquor produces high amounts of fine alkali fume, which is produced during the pyrolysis and is extremely difficult to remove by any known method, such as wet scrubbing or filtration. The condensation of these fine alkali particles on cold surfaces could also cause serious fouling and corrosion problems and may even clog the heat exchangers. The only way to remove alkali compounds from the product gas is to condense the submicron alkali particles and then to remove condensed and larger agglomerated particles by conventional methods, such as bagfilters. The recovery of alkali compounds can be carried out in a granular bed filter where the product gas is cooled down to 500 deg C and alkalis are condensed on the filter media. In addition to this, gasification air can be preheated in this device. Spent filter media can be returned back to the gasifier or dissolved in the dissolver. The results in this report clearly show the effectiveness of granular bed filters in removing alkalis from the product gas. Especially fluidized bed type granular bed filters seems to be the most suitable and offer the possibility of recovering sodium in a useful form.

23333 (OCDO-93012032) **Modification, relocation and operation of the Pedco Rotary Cascading Bed Boiler: Final report.** Long, W.H. (PEDCO, Inc., Cincinnati, OH (United States)). Ohio Coal Development Office, Columbus, OH (United States); PEDCO, Inc., Cincinnati, OH (United States). 31 Jul 1992. 232p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001 (United States).

The Pedco Rotary Cascading Bed Demonstration Boiler was moved from the closed Hudepohl plant to the Zurn plant in Erie, Pennsylvania following the completion of a license agreement between Pedco and Zurn. The modifications were completed and the boiler installed in a new test building at the North American plant in Elizabethton, Tennessee. Test operations were initiated in Dec. 1990 and concluded in January 1992. Over thirty different fuels and fuel combinations were tested including high sulfur coals, coal wastes, industrial sludges, municipal solid wastes, oils and solvents, treated wood wastes – all alone and co-fired with high sulfur coal. Based on the test results and operational observations, the following major conclusions have been drawn from the Elizabethton operations: (1) The Pedco Rotary Cascading Bed Combustion System can burn high sulfur and waste coals in an economically and environmentally acceptable manner. (2) The Pedco Rotary Cascading Bed Combustion System can burn a wide variety of fuels and fuel mixes cleanly and economically. (3) Fuels can be changed "on-the-fly" without shutting down or losing desired steam conditions. (4) Fly ash from high sulfur coal has the potential for beneficial uses as a soil Conditioner, fertilizer ingredient or construction material additive.

23334 (DOE/PC/90292-T10) **Alternative formulations of regenerable flue gas cleanup catalysts: Progress report, December 1, 1992–February 28, 1993.** Mitchell, M.B.; White, M.G. Clark Atlanta Univ., GA (United States). 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90292. Order Number DE93014965. Source: OSTI; NTIS; GPO Dep.

In the work done so far, we have examined the properties of adsorbents prepared by the novel method of depositing a layer of the precursor (metal acetylacetonates) on the alumina surface. These samples were activated by decomposing the precursors to their oxides. It was possible to obtain a fairly predictable trend in the SO_2 adsorption properties of the adsorbents as long as the metal acacs did not dissociate in solution. This was observed in the case of the magnesium supported samples. Lithium supported samples exhibited a high SO_2 pickup rate at low metal loadings on alumina but the incremental SO_2 pickup rate at low metal loadings on alumina but the incremental SO_2 pickup was poor; one explanation for this observation is the dissociation of Li(acac) prior to its adsorption on alumina from the solution. We decided to investigate the properties of adsorbents prepared by aqueous impregnation to investigate the virtues of non-ionizing vs. ionizing precursors. We also carried out infrared investigations of the supported lithium precursor, in an attempt to determine the nature of this material. Conductivity analyses, presented in earlier reports, suggest that the Li(acac) ionizes in methanol solution. Elemental analyses, also presented in earlier reports, indicate a carbon/lithium ratio of 1.6 for the supported precursor, much less than the value of 5 expected from the precursor stoichiometry. Based on our earlier success using infrared spectroscopy for characterization of the magnesium and copper precursors, we decided to investigate the nature of the supported lithium complex using the same technique.

23335 (DOE/PC/90361-T9) **Catalytic fabric filtration for simultaneous NO_x and particulate control: Quarterly technical progress report, October 1–December 31, 1992.** Weber, G.F.; Ness, S.R.; Laudal, D.L.; Dunham, G. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Feb 1993. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90361. Order Number DE93014961. Source: OSTI; NTIS; GPO Dep.

The EERC approach to meeting the program objective involves the development of a catalytic fabric filter for simultaneous NO_x and particulate control. The idea of applying either permanent or throwaway catalysts to a high-temperature fabric filter for NO_x control is not new. However, advances at OCF have shown that a high-activity catalyst can be applied to a high-temperature woven glass cloth resulting in a fabric filter material that can operate at temperatures higher than the maximum operating temperatures of commercially available, coated glass fabric. The NO_x is removed

by catalytic reduction with ammonia to form nitrogen and water. The catalyst employed at this time is vanadium/titanium, but the exact catalyst composition and the unique method of applying the catalyst to high-temperature glass fabric are the property of OCF. Other catalyst options are being evaluated by OCF in order to improve catalyst performance and minimize catalyst cost. Bench-scale experimental results to date have shown that over 90% NO_x removal can be achieved, the catalyst/fabric has promising self-abrasion characteristics, and the potential exists for substantially reduced cost when compared with conventional SCR/fabric filtration technology. However, development of the technology requires further evaluation of air-to-cloth ratio, ammonia slip, SO_2 oxidation to SO_3, temperature cycling, catalyst-coated fabric preparation, fuel impacts, fabric cleaning (reverse-gas versus pulse-jet), catalyst life (poisoning and resistance to erosion), and filter performance/life (particulate control, differential pressure, and durability).

23336 (DOE/PC/90364–T6) **Flue gas conditioning for improved particle collection in electrostatic precipitators: First topical report, Results of laboratory screening of additives.** Durham, M.D. ADA Technologies, Inc., Englewood, CO (United States). 16 Apr 1993. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90364. (ADA–4300-93-T1). Order Number DE93014939. Source: OSTI; NTIS; GPO Dep.

Several tasks have been completed in a program to evaluate additives to improve fine particle collection in electrostatic precipitators. Screening tests and laboratory evaluations of additives are summarized in this report. Over 20 additives were evaluated; four were found to improve flyash precipitation rates. The Insitec particle analyzer was also evaluated; test results show that the analyzer will provide accurate sizing and counting information for particles in the size range of $\leq$ 10 μm dia.

23337 (DOE/PC/90366–T6) **Characterization of air toxics from a laboratory coal-fired combustor and utility scale power plants: Quarterly progress report No. 6, January–March 1993.** Battelle, Columbus, OH (United States). Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90366. Order Number DE93014954. Source: OSTI; NTIS; GPO Dep.

Laboratory combustor studies were conducted at Battelle in the fall of 1992 to evaluate sampling methods and analysis techniques for air toxics generated by buming pulverized coal. These experiments were described in the fifth quarterly progress report. In this report results from additional analyses of samples are reported. Results are shown in Tables 1–8 for analysis of nitro-polycyclic aromatic hydrocarbons (nitro-PAH), oxygenated PAH (oxy-PAH), hydroxy-nitro-aromatic compounds (OH-NO2-AR/PAH), and PAH derivatives containing sulfur (PASH) and nitrogen (PANH). In the tables the two fning rates refer to the rate at which coal was fired in the laboratory fumace. The high firing rate was 5.7 g/s (45 lbs/hr), and the low firing rate was 5.3 g/s. The first letter in the sample identification refers to high (H) or low (L) coal firing rate. The second letter refers to either the hot flue samples (H) or samples collected with a Plume Simulating Dilution Sampler (D). The third letter refers to the particle size range. Size range A was about 3.3-7.1 μm. Size range B was about 0.87-3.3 Jim. Size range C was less than 0.87-3.3μm. Size range C was less than 0.87μm. The nitro-PAH data from the hot flue and PSDS vapor and particle samples are summarized in Tables 1 through 4. The data on oxy-PAH, N02-OH-AR/PAH, PASH, and PANH from the PSDS particle samples are given in Tables 5 through 8, respectively. The most abundant target oxyPAH is fluorenone. Higher concentrations were found in size C samples as compared to the size A and size B composite samples. A similar relative concentration trend was also observed for other PAH derivatives.

23338 (DOE/PC/90544–T6) **Healy Clean Coal Project, Healy FCM testing at Niro Air Pollution Control Pilot Facility: Final report.** Alaska Industrial Development and Export Authority, Anchorage, AK (United States); Joy Environmental Technologies, Inc., Houston, TX (United States). Oct 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-91PC90544. Order Number DE93014937. Source: OSTI; NTIS; GPO Dep.

In September, 1991, pilot testing was performed at the Niro Air Pollution Control Pilot Plant in Copenhagen, Denmark in support of the Healy Clean Coal Project (HCCP), which is part of the United States Department of Energy (DOE) Clean Coal Technology III Program. The HCCP is a proposed new coal fired power plant, located in Healy, Alaska. It consists of a TRW entrained combustion system, coupled with a limestone calciner, which operates in synergism with a Joy/Niro Spray Dryer Absorber (SDA) system equipped with a lime activation system that is designed to increase the utilization of the calcined product for sulfur capture in the SDA. The pilot tests, which were funded by the United States Department of Energy (DOE) and the Alaska Industrial Development and Export Authority (AIDEA), were conducted to investigate the characteristics of the TRW combustor/limestone calciner product, referred to as Flash Calcined Material (FCM) with respect to its ability to remove $S0_2$ in the Joy/Niro Activated Recycle SDA system. This report describes the pilot facility, the test objectives and methods, and the results of the tests.

23339 (DOE/PC/91284–5) **Nitration of polynuclear aromatic hydrocarbons in coal combustors and exhaust streams: Quarterly report, October 1, 1992–December 31, 1992.** Yu, L.; Dadamio, J.; Hildemann, L.; Niska, S. Stanford Univ., CA (United States). Dept. of Civil Engineering. May 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91284. Order Number DE93014977. Source: OSTI; NTIS; GPO Dep.

During the period October 1, 1992 to December 31, 1992, the technical projects proceeded smoothly without any major obstacles. Regarding PAH preparation, our efforts this quarter were directed at preparing PAH samples at well-controlled extents of primary devolatilization and secondary pyrolysis from all of the coals in our project plan. Our database is now complete for a Dietz subbituminous coal, Ill. No. 6 and Pit No. 8 hvA bituminous coals, and a Lower Kittening 1v bituminous coal. For all 4 coals, weight loss, aerosol yields, and soot fractions were observed for at least 2 extents of primary devolatilization, and for extents of secondary pyrolysis which span nearly the entire range of values. PAH samples were recovered for subsequent analysis at each operating condition, so all samples for primary devolatilization and secondary pyrolysis are now in hand. For sample analysis, research this quarter focused on finalizing the prefractionation methodology. Tests were conducted to ensure that the mass determinations for the sample fractions were accurate and reproducible. Tetrahydrofuran (THF) was added as the fifth and final solvent in the prefractionation scheme. We are now able to reproducibly achieve 90% mass recovery of the Pit. No. 8 coal tar, due to the additional 10% of mass now being recovered with the THF solvent addition step.

23340 (DOE/PC/91344–T3) **Advanced separation technology for flue gas cleanup: Quarterly Technical Report No. 3, January 1993.** Gottschlich, D.E. SRI International, Menlo Park, CA (United States). 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91344. Order Number DE93014971. Source: OSTI; NTIS; GPO Dep.

In the fourth quarter of 1992, we continued work on Tasks 2, 3, and 4. In Task 2, we continued preparation of the reversible absorption apparatus for measuring SO_2 and NO_x solubilities. We received and installed the gas cabinet necessary for safe handling of these gases and made several modifications to the reversible absorption apparatus aimed at reducing the time required for each measurement. We also began evaluating chromatography columns for their ability to separate SO_2, N_2, and O_2. In Task 3, we synthesized three polymers of dimethylangline (DMA). The first, an oligomer of DMA, resulted in an insoluble (to most solvents) solid that is unsuitable for use as an absorbent. In order to produce a liquid material, we synthesized several DMA copolymers. A 50:50 (mole ratio) copolymer of N-phenylaziridine and propyleneimine also resulted in a solid; however, reducing the N-phenylaziridine to propyleneimine ratio to 30:70 produced a liquid at room temperature. Fourteen grams of the 30:70 copolymer were, prepared for absorption measurements. In Task 4, we performed three sets of BFC experiments. The objective of the first two sets was to determine the liquid phase mass transfer coefficient and the objective of the third set was to determine SO_2 removal efficiencies. The

Hoechst/Celanese (H/C) BFC modules were not received until late December, limiting us to prototype modules. SO_2 removal efficiencies were greater than 96% even with the prototype modules.

23341 (DOE/PC/91345–T8) **A novel carbon-based process for flue gas cleanup: Seventh quarterly technical progress report, January 1–March 31, 1993.** Gangwal, S.K. (Research Triangle Inst., Research Triangle Park, NC (United States)); Silveston, P.L. Research Triangle Inst., Research Triangle Park, NC (United States); Waterloo Univ., ON (Canada). Apr 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91345. Order Number DE93014956. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to demonstrate the preliminary technical and economic feasibility of a novel carbon-based process for removal of at least 95 % SO_2, and at least 75 % NO_x from coal combustion flue gas. In the process, flue gas leaving the electrostatic precipitator (ESP) is passed through a trickle bed of activated carbon catalyst employing a periodic flush of low strength sulfuric acid. The SO_2 is oxidized to SO_3 and removed as medium strength sulfuric acid. The SO_2-free flue gas is then mixed with NH_3, and the NO_x in the gas is subjected to selective catalytic reduction (SCR) to N_2 over a fixed bed of activated carbon catalyst. In the previous six quarters, detailed project plans were prepared and experimental systems were commissioned. The SO_2 removal factorial experiments with BPL carbon at 21°C are well underway at Waterloo. A modified carbon catalyst (MCCI) showed up to 99% SO_2 removal in the presence of NO_x over 10 multiple cycles at 80–130°C and 1400 scc/cc/h. Several catalysts were evaluated for NO_x removal also. Promising modified carbon catalysts (MCCI, II and III) were tested. Some of these catalysts showed the potential-for over 80% NO_x removal at space velocities as high as 3000 scc/cc/h. Poisoning of NO_x removal efficiency with SO_2 in the feed was also studied. With over 100 ppm SO_2 in feed, NO_xremoval efficiency remained steady for several hours. It declined from 79% removal to 66% removal over 24 hours. NO_x removal experiments were performed with 5 different materials and the SO_2 removalactivity of 2 catalysts was tested.

23342 (DOE/PC/91346–1) **Development of the integrated environmental control model: Technical progress report, [October 1–December 31, 1992].** Rubin, E.S. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Center for Energy and Environmental Studies. Jan 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91346. Order Number DE93015057. Source: OSTI; NTIS; GPO Dep.

In its current configuration, the IECM provides a capability to model various conventional and advanced processes for controlling air pollutant emissions from coalfired power plants before, during, or after combustion. The principal purpose of the model is to calculate the performance, emissions, and cost of power Plant configurations employing alternative environmental control methods. The model consists of various control technology modules, which may be integrated into a complete utility plant in any desired combination. in conuwt to conventional deterministic models, the IECM offers the unique capability to assign probabilistic values to all model input parameters, and to obtain probabilistic outputs in the form of cumulative distribution functions indicating the likelihood of different costs and performance results. The most recent version of the IECM, implemented on a Macintosh II computer and containing a number of software and model enhancements, was delivered to DOE/PETC at the end of the last contract in May 1991. The current contract will continue the model development effort to provide DOE/PETC with improved model capabilities, including new software developments tO facilitate model use and new technical capabilities for analysis of environmental control technologies and integrated environmental control systr,ms involving precombustion, combustion, and Post-combustion control methods. The work in this contract is divided into two phases. Phase I deals with further developing the existing version of the IECM and training PETC personnel on the effective use of the model. Phase H deals with creating new technology modules, linking the IECM with PETC databases, and training PETC personnel on the effective use of the updated model.

23343 (OCDO–93012029) **Catalytic filter bags for NO_x and particulate removal: Final report.** Kalinowski, M.R. (Owens-Corning Fiberglas Corp., Granville, OH (United States). Technical Center). Ohio Coal Development Office, Columbus, OH (United States); Owens-Corning Fiberglas Corp., Granville, OH (United States). Technical Center. Feb 1992. 64p. Sponsored by Ohio State Government, Columbus, OH (United States). Contract CDO/R-89-36. Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001 (United States).

The approach pursued by Owens-Corning Fiberglas (OCF), under the Ohio Coal Development Office sponsorship, was to control NO_x, particulates and SO_x in one unit by using a catalyst-coated fabric. Owens-Corning Fiberglas Corporation (OCF) has demonstrated the feasibility of controlling particulates and nitrogen oxide emissions with such a fabric on a bench-scale level. In this process, NO_x emissions can be reduced by 90%. Ammonia is injected in the flue gas; in the presence of a catalyst, it reacts at 650°F with the nitrogen oxide to form nonpolluting nitrogen and water. The fabric is made of S-glass that can readily operate at the required temperature; the catalyst is coated on the fabric, using a proprietary process developed by OCF. Small scale tests had shown that the use of a glass fabric to support the catalyst permits extremely efficient use of the catalyst (10 to 100 times more efficient than present SCR technology). SO_x was eliminated by alkali injection. Combining filtration, NO_x and SO_x reduction in one operation would be significantly more economical than using a filter bag or electrostatic precipitator, an SCR unit, and a desulfurization system.

23344 (OCDO–93012030) **Study of in-duct spray drying using condensation aerosol: Final report, June 16, 1990–June 15, 1992.** Chen, W.J.R. (Ohio Univ., Athens, OH (United States)); Chang, S.M.; Adikesavalu, R. Ohio Coal Development Office, Columbus, OH (United States); Ohio Univ., Athens, OH (United States). Jun 1992. 47p. Sponsored by Ohio State Government, Columbus, OH (United States). Grant CDO/R-89-4. Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001 (United States).

Sulfur removal efficiency of in-duct spray drying is limited by sorbent content and surface properties of the sorbent-water aerosol. It was the purpose of this study to improve the sulfur removal efficiency for in-duct spray drying by injecting condensation aerosol instead of conventional dispersion aerosol. The program was composed of three phases. In Phase I, a novel pulsed fluid bed feeder was developed and was used to feed hydrated lime for subsequent experiments. A small condensation aerosol generator was then built, which produces a lime-water condensation aerosol by condensing steam on lime particles. The results show that novel lime-water aerosols less than 10 microns were generated. The central task in Phase II was to simulate experimentally in-duct spray drying using condensation aerosols and compare the results with those using dispersion aerosols reported in the literature. A small entrained-flow reactor was constructed to simulate an in-duct spray dryer. The condensation aerosol was then introduced to the reactor at various approach to saturation temperature, calcium/sulfur stoichiometry and sulfur dioxide concentration for desulfurization study. The results show that we have improved the sulfur removal efficiency for in-duct spray drying to 90 percent or above. Thus we have met and exceeded the stated project goal of 70 percent sulfur removal. A comprehensive computer code was employed to calculate sulfur removal efficiency in Phase III.

23345 (OCDO–93013790) **Ohio Coal Development Office test program at TRW's Cleveland, Ohio entrained coal combustion facility: Final report.** Ohio Coal Development Office, Columbus, OH (United States); TRW Energy Products Group, Redondo Beach, CA (United States). Combustion Business Unit. Dec 1990. 405p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001.

The objective of the OCDO test program was to obtain maximum sulfur capture results utilizing three Ohio coals, and Ohio limestones, with practical levels of limestone injection, in-duct humidification and baghouse catch recycle. For this program, 240 tests were conducted using three Ohio coals of different sulfur content (low: 0-1.99%, medium: 2.0-2.5%, and high 2.5+%) and three

Ohio limestones. These tests demonstrated that the TRW Entrained Coal Combustor can control sulfur emissions by injecting pulverized limestone as a sorbent directly into the combustor gases entering the furnace. SO_x reduction of up to 90 percent was achieved with medium-sulfur coal (2.5% as-fired) and fine limestone (7-μm) at a calcium-to-sulfur molar ratio of 3.5. Among the conditions found to affect the reduction of sulfur emissions were: the method of limestone injection, load, calcium-to-sulfur molar ratio, sorbent particle size, coal sulfur content, and in-duct humidification. SO_x reduction was maximized by utilizing limestone injection with the flow spat evenly between two (2) injection locations. Additional tests using limestone injection gave rise to the following results: (1) In-duct humidification in combination with coarse limestone increased SO_x reduction 20 percent over the baseline condition. (2) Recycle of baghouse solids to the furnace in combination with direct new limestone feeding did not appreciably increase SO_x reduction over coarse limestone injection only. (3) NO_x emissions as low as 250 ppM were achieved. These tests showed that NO_x emissions in the Cleveland unit from Ohio coal were not a strong function of combustor stoichiometry. Lower levels are expected in utility boilers which are not refractory lined and use supplementary NO_x ports.

23346 (OCDO–93013797) **SO_x-NO_x-Rox Box systems integrations study.** Ohio Coal Development Office, Columbus, OH (United States); Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div. 7 Aug 1992. 250p. Sponsored by Ohio State Government, Columbus, OH (United States). Contract CDO/R-88-04;Contract CDR-1231. Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001.

Recently proposed amendments to the Clean Air Act will require some utilities to retrofit pollution control equipment to existing boilers. This has generated interest in low capital cost technologies capable of simultaneously removing SO_2 and NO_x from boiler flue gases. Babcock & Wilcox's (B&W's) patented SO_x-NO_x-Rox Box (SNRB) process has been developed to provide boiler operators with a cost-effective way to simultaneously reduce emissions of particulate matter (Rox) and the oxides of sulfur (SO_x) and nitrogen (NO_x) from their coal-fired units. The SO_x-NO_x-Rox Box process offers several potential benefits: One major component; capital cost and space requirements are minimized by performing the SO_x, NO_x, and particulate removal operations in a single piece of equipment: Longer catalyst life; SO_x and particulates are removed from the flue gas stream upstream of the SCR catalyst, minimizing catalyst poisoning. pluggage and erosion concerns: Dry materials handling; reagent preparation, handling, and disposal costs are minimized because both the fresh sorbent and waste streams are dry; and "Unpromoted catalyst"; the SCR catalyst used for calcium-based SNRB systems can be an unpromoted zeolite material. This avoids the potential hazardous waste disposal concerns associated with promoted catalysts containing metals such as vanadium.

23347 (OCDO–93013798) **Advanced wet flue gas desulfurization and denitrification process, Miami Fort station: Volume 1: Final report.** Ohio Coal Development Office, Columbus, OH (United States); Cincinnati Gas and Electric Co., OH (United States); Dravo Lime Co., Pittsburgh, PA (United States). Nov 1991. 264p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001.

The Cincinnati Gas and Electric Company and Dravo Lime Company successfully completed a pilot plant testing program for the Ohio Coal Development Office. The 3 to 4.5 MW pilot system was installed at the Miami Fort station of the Cincinnati Gas and Electric Company near North Bend, Ohio, and treated a slipstream of flue gas taken from Miami Fort Unit 7. The pilot plant was designed and constructed to test improvements to the magnesium-enhanced lime wet flue gas desulfurization (MEL FGD) process. Construction of the pilot facility and testing were co-sponsored by the Ohio Coal Development Office, Cincinnati Gas and Electric Co., and Dravo Lime Company. The magnesium-enhanced lime wet FGD process, also known as the Thiosorbic® lime process, was developed by Dravo Lime Company. The project had three main objectives. The first was to test design concepts that, if proven in pilot tests and then implemented in a full-scale FGD system, could reduce the cost of equipment required for FGD. A 30 percent reduction in overall equipment cost was sought, along with reduction in operating costs. The baseline for cost reduction was the cost of a conventional limestone-based FGD system. One purpose of the project was to test concepts to improve the magnesium-enhanced lime FGD system. These concepts, if successfully tested, could lead to new design bases for MEL FGD systems.

23348 (OCDO–93013799) **Advanced wet flue gas desulfurization and denitrification process, Miami Fort station: Volume 2: Final report.** Ohio Coal Development Office, Columbus, OH (United States); Cincinnati Gas and Electric Co., OH (United States); Dravo Lime Co., Pittsburgh, PA (United States). Nov 1991. 146p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266–0001.

Two hundred and sixty-one coal-fired electric utility generating units in the United States are affected by Phase 1 the 1990 Clean Air Act revisions. The total MW of generating capacity affected is 87,261. Dravo Lime projects that 24,400 MW will be retrofitted with wet FGD for Phase 1; in Phase 2, another 6,600 MW will be retrofitted. Forty-one of the affected units, with a total capacity of 14,343 MW, are located Ohio. Figure A1 shows the location and approximate size of these units. Table A1 lists the units and itemizes the allowable emissions. It is likely that several of the larger units in Ohio and elsewhere will be retrofitted by 1995–1997 with magnesium-enhanced lime based wet FGD, and the improvements found in the testing program could be included as part of these installations. Smaller diameter absorbers built for higher flue gas velocities would be easier to fabricate off-site and to ship by barge on the Ohio River to the plant site, as was done for the absorbers installed at the Zimmer station. Much smaller thickeners would be easier to fit onto cramped sites in retrofits.

23349 (ANL/EAIS/CP–78990) **Ozone nonattainment: Implications for NO_x and VOC compliance by the electric power industry.** Fernau, M.E.; South, D.W.; Guziel, K.A. Argonne National Lab., IL (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930433–5: 55. annual American power conference, Chicago, IL (United States), 13-15 Apr 1993). Order Number DE93009969. Source: OSTI; NTIS; INIS; GPO Dep.

Title I of the Clean Air Act Amendments of 1990 requires that regions not in ozone attainment and designated as "severe" take actions to achievement by 2007. In a several-phase study for the US Department of Energy, ANL is investigating the impact and implications of the Title I requirements in the Chicago Metropolitan Area. As part of tie study we examined the potential additional compliance requirements that might be imposed on the electric power industry, after satisfying $O_2$and NO_x requirements specified in Title IV, to achieve attainment in Chicago. Alternative scenarios were examined to show the incremental emission reductions and air quality effects of each action. The Urban Airshed Model (UAM) selected by the US Environmental Protection Agency (EPA) for ozone compliance modeling, was used to assess the effects on air quality. Preliminary results show that, for the episode modeled, compliance with Title TV regulations for utility NO_x emissions did not have much effect on air quality. Consequently, if utilities are the targeted emissions source, it is possible that additional regulations beyond Title IV may be imposed. However, complete removal of utility emissions did not lead to attainment and only improved air quality by 20–25% of the improvement from removing all emissions, pointing out the importance of non-utility sources to the ozone problem in the region. Non-utility sources will be investigated further in another phase of this work.

23350 (LBL–30933) **Modeling of reactive chemical transport of leachates from a utility fly-ash disposal site.** Apps, J.A. (Lawrence Berkeley Lab., CA (United States)); Zhu, M.; Kitanidis, P.K.; Freyberg, D.L.; Ronan, A.D.; Itakagi, S. Lawrence Berkeley Lab., CA (United States); Stanford Univ., CA (United States). Dept. of Civil Engineering. Apr 1991. 6p. Sponsored by Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC03-76SF00098. Contract RP2485-15;Contract RP2485-19. (CONF-9107230–2: International symposium on ground water in practice, Nashville, TN (United States), 29 Jul - 2 aug 1991). Order Number DE93010442. Source: OSTI; NTIS; INIS; GPO Dep.

Fly ash from fossil-fuel power plants is commonly slurried and pumped to disposal sites. The utility industry is interested in finding out whether any hazardous constituents might leach from the accumulated fly ash and contaminate ground and surface waters. To evaluate the significance of this problem, a representative site was selected for modeling. FASTCHEM, a computer code developed for the Electric Power Research Institute, was utilized for the simulation of the transport and fate of the fly-ash leachate. The chemical evolution of the leachate was modeled as it migrated along streamtubes defined by the flow model. The modeling predicts that most of the leachate seeps through the dam confining the ash pond. With the exception of ferrous, manganous, sulfate and small amounts of nickel ions, all other dissolved constituents are predicted to discharge at environmentally acceptable concentrations.

Much consideration is being given to the impact of the Clean Air Act Amendments of 1990 (the Amendments) on electric utilities. Certainly, these statutory changes will affect the way utilities do business. But legal pressures can also arise without legislative action. In this paper we call attention to changes in the programs for prevention of significant deterioration (PSD) and visibility of the Clean Air Act (the Act) that are occurring quietly, outside the spotlight of statutory change.

21 NUCLEAR POWER REACTORS AND ASSOCIATED PLANTS

Refer also to citation(s) 23748

23353 (CONF-920906–3) **Trends in advanced reactor development and the role of the IAEA.** Semenov, B. (International Atomic Energy Agency, Vienna (Austria). Dept. of Nuclear Energy and Safety); Dastidar, P.; Kupitz, J.; Cleveland, J.; Goodjohn, A. Oak Ridge National Lab., TN (United States). [1992]. 16p. Order Number DE93011866. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses advanced reactors are being developed for all principal reactor types, i.e. the light and heavy water-cooled reactors, the liquid-metal-cooled reactors and the gas-cooled reactors. Some of these developments are primarily of an evolutionary nature, i.e. they represent improvements in component and system technology, and in construction and operating practices as a result of experience gained with presently operating plants. Other developments are also evolutionary but with some incorporation of innovative features such as providing passive systems for assuring continuous cooling for removal of decay heat from the reactor core. If there is a revival of nuclear power, which may be dictated by ecological and economical factors, advanced reactors now being developed could help to meet the large demand for new plants in developed and developing countries, not only for electricity generation, but also for district heating, desalination and for process heat. The IAEA, as the only global international governmental organization dealing with nuclear power, has promoted international information exchange and international cooperation between all countries with their own advanced nuclear power programmes and has offered assistance to countries with an interest in exploratory or research programmes. In the future the IAEA could play an even more-important role.

The role and purpose of safety principles for nuclear power plants are discussed. A brief information is presented on safety objectives as given in the INSAG documents. The possible linkage is discussed between the two mentioned elements of nuclear safety and safety culture. Safety culture is a rather new concept and there is more than one interpretation of the definition given by INSAG. The defence in depth is defined by INSAG as a fundamental principle of the safety technology of nuclear power. Discussed is the overall strategy for safety measures, and features of nuclear power plants provided by the defence-in-depth concept. (Z.S.) 7 refs.

Safety culture is used as a synonym for safety consciousness of the operating personnel and safety-oriented management of all activities inside a nuclear power plant. Establishing safety culture in nuclear power plant operation and maintenance calls for the existence of a safe and reliable reactor safety concept, derived from a reactor safety analysis and nuclear power plant operation experience. Competence of plant personnel and safety culture in the operation, maintenance and repair of nuclear power plants are discussed. (Z.S.).

23358 (INIS-mf–13503, pp. 8-11) **Computer aided training in nuclear power engineering at the Gdansk Technical University.** Marecki, J. (Gdansk Univ. (Poland)); Duzinkiewicz, K.; Kosmowski, K.T. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The Faculty of Electrical Engineering of the Gdansk Technical University has organized post-graduate studies in nuclear power engineering in cooperation with the Institute of Nuclear Research at Swierk since 1973. Post-graduate courses in nuclear power plant construction and design were organized twice. Between 1986 and 1990, prototype software was developed for aiding lectures, self-teaching and knowledge testing in the following fields: (1) dynamics and control of nuclear reactors; (2) simulators of nuclear power plant basic systems (reactor, steam generator, steam turbine, and synchronous generator). (Z.S.) 2 refs.

23359 (INIS-mf–13503, pp. 27-30) **The multi-function simulator.** Remacle, J. (Belgatom SA, Brussels (Belgium)); Billoen, G. Van. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The need is discussed for simulators in basic principle learning, for specific training on specific functions, for full operation training, for accident analyses as well as the modern tools for modern needs. An optimization is proposed of hardware configuration and software specifications of the equipment to be installed in training centres. (Z.S.).

23360 (INIS-mf–13503, pp. 242-245) **Decision making concept of risk control: integration of decision criteria, top level risk indices and plant performance indices.** Vojnovic, D. (Institut Jozef Stefan, Ljubljana (Yugoslavia)); Mavko, B.; Kozuh, M. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A support system for risk monitoring and control is suggested. The following concepts of system elements are briefly discussed: risk curve partitioning, the reliability cost function, the multi-objective optimization model, preference assessment, safety/risk indicators, and knowledge based systems. (Z.S.) 2 figs.

23361 (NUREG–0020-Vol.17) **Licensed operating reactors: Status summary report data as of December 31, 1992: Volume 17.** Hartfield, R.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Computer and Telecommunications Services. Mar 1993. 341p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

The Nuclear Regulatory Commission's annual summary of licensed nuclear power reactor data is based primarily on the report of operating data submitted by licensees for each unit for the month of December because that report contains data for the month of December, the year to date (in this case calendar year 1992) and cumulative data, usually from the date of commercial operation. ne data is not independently verified, but various computer checks are made. The report is divided into two sections. The first contains summary highlights and the second contains data on each individual unit in commercial operation Section 1 capacity and availability factors are simple arithmetic averages. Section 2 items in the cumulative column are generally as reported by the licensee and notes as to the use of weighted averages and starting dates other than commercial operation are provided.

23362 (BNL-NUREG–48415) **Prediction of BWR performance under the influence of Isolation Condenser-using RAMONA-4 code.** Khan, H.J.; Cheng, H.S.; Rohatgi, U.S. Brookhaven National Lab., Upton, NY (United States). [1992]. 20p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930830–3: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93007271. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Boiling Water Reactor (BWR) Isolation Condenser (IC) is to passively control the reactor pressure by removing heat from the system. This type of control is expected to reduce the frequency of opening and closing of the Safety Relief Valves (SRV). A comparative analysis is done for a BWR operating with and without the influence of an IC under Main Steam Isolation Valve (MSIV) closure. A regular BWR, with forced flow and high thermal power, has been considered for analysis. In addition, the effect of ICs on the BWR performance is studied for natural convection flow at lower power and modified riser geometry. The IC is coupled to the steam dome for the steam inlet flow and the Reactor Pressure Vessel (RPV) near the feed water entrance for the condensate return flow. Transient calculations are performed using prescribed pressure set points for the SRVs and given time settings for MSIV closure. The effect of the IC on the forced flow is to reduce the rate of pressure rise and thereby decrease the cycling frequency ofthe SRVS. This is the primary objective of any operating IC in a BWR (e.g. Oyster Creek). The response of the reactor thermal and fission power, steam flow rate, collapsed liquid level, and core average void fraction are found to agree with the trend of pressure. The variations in the case of an active IC can be closely related to the creation of a time lag and changes in the cycling frequency of the SRVS. An analysis for natural convection flow in a BWR indicates that the effect of an IC on its transient performance is similar to that for the forced convection system. In this case, the MSIV closure, has resulted in a lower peak pressure due to the magnitude of reduced power. However, the effect of reduced cycling frequency of the SRV due to the IC, and the time lag between the events, are comparable to that for forced convection.

23363 (BNL-NUREG–48448) **Benchmark analysis for the design of piping systems in advanced reactors.** Bezler, P. (Brookhaven National Lab., Upton, NY (United States)); DeGrassi, G.; Braverman, J.; Shounien Hou. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9303103–1: American Society of Mechanical Engineers (ASME) conference on seismic analysis, San Francisco, CA (United States), 22-24 Mar 1993). Order Number DE93008053. Source: OSTI; NTIS; INIS; GPO Dep.

To satisfy the need for the verification of the computer programs and modeling techniques that will be used to perform the final piping analyses for an advanced boding water reactor standard design, three piping benchmark problems were developed. The problems are representative piping systems subjected to representative dynamic loads with solutions developed using the methods being proposed for analysis for the advanced reactor standard design. It will be required that the combined license holders demonstrate that their solutions to these problems are in agreement with the benchmark problem set. A summary description of each problem and some sample results are included.

23364 (INIS-mf–13502, pp. 51-60) **Advanced systems for training in emergency operating procedures.** Ugedo, E. (TECNATOM SA, Madrid (Spain)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The need is emphasized for training operating personnel of nuclear power plants in emergency operating procedures, and the resources are described developed by Tecnatom with a view to increasing the efficiency of instruction provided for all users of the Spanish training center. The solutions provided consist specifically of preparing highly accurate physical models for specific full-scope simulators, and developing a modification of the conventional simulator known as the Interactive Graphics Simulator. (author).

23365 (INIS-mf–13502, pp. 135-146) **NPP evaluation, backfitting and life extension - an engineering viewpoint.** Gonzales, A. (Empresarios Agrupados, Madrid (Spain)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

During the decade of the '80s, the owners of the two oldest operating plants in Spain, namely, the Jose Cabrera plant, a Westinghouse PWR, and the Santa Maria de Garona plant, a GE BWR, undertook the following important programmes: (1) a far-reaching Systematic Evaluation Programme for the Jose Cabrera plant consisting in a systematic safety review of the plant design followed by the necessary hardware modifications to upgrade it and to make it comply with current safety criteria, and a Plant Upgrading Programme for the Garona plant focusing on specific topics affecting GE BWR Mark-I type plants of the same vintage; (2) a Remaining Life Management Programme to ensure that the units, after extensive backfitting and high capital investment, would complete their design life, leaving open the option for plant life extension. These two units are today looked upon by the Spanish nuclear industry as the pilot plants for Plant Life Extension programmes for PWRs and BWRs in Spain. The experience learned by the organization of Empresarios Agrupados in the engineering, design and implementation of these programmes is summarized. (Z.S.).

In nuclear power plants the multi-barrier concept is used to limit the potential release of radioactive fission products to the environment. This so-called defence-in-depth concept consists of three classic barriers, namely the fuel cladding, the reactor coolant pressure boundary, and the containment system. Backfitting measures applied to the containment system are summarized which cope with the loadings beyond design basis. Differences in the design and backfitting philosophy of nuclear power plants (containment venting system, hydrogen mitigation system, containment flooding system) are discussed. (Z.S.) 4 figs.

Some examples are presented of upgrading recently performed at Swedish nuclear power plants; the examples shall serve as a background for discussion. To illustrate possible advances, some examples are also given of future techniques which are currently being studied. The following areas are covered: in-core instrumentation; improvement of essential systems, in particular to allow for operation closer to the margin set; additional instrumentation for better handling of particular situations like shutdown and loss of coolant events; instrumentation for plant aging and fault assessment. In all areas a trend can be seen to put the emphasis on data processing. (Z.S.) 7 refs.

23368 (INIS-mf–13503, pp. 160-165) **Motor-operated valve analysis program to address the design basis review requirements of the US NRC's Generic Letter 89-10.** Recinella, M. (Westinghouse Energy Systems International, Brussels (Belgium)); Isaac, F.; Matty, T. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The elements and the methodologies are described used by Westinghouse to address the Motor-Operated Valve (MOV) Design Basis Review requirements of the NRC Generic Letter 89-10, namely, data collection, thrust and torque calculation, valve weak link analysis, motor operator evaluation and MOV recommended torque switch setting. (Z.S.) 7 refs.

23369 (JAERI-M–93-006) **Experimental data report for Test TS-2 reactivity initiated accident test in NSRR with pre-irradiated BWR fuel rod.** Nakamura, Takehiko (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Yoshinaga, Makio; Sobajima, Makoto; Fujishiro, Toshio; Kobayashi, Shinsho; Yamahara, Takeshi; Sukegawa, Tomohide; Kikuchi, Teruo. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 107p. Order Number DE93797596. Source: OSTI; NTIS; INIS.

This report presents experimental data for Test TS-2 which was the second test in a series of Reactivity Initiated Accident (RIA) condition test using pre-irradiated BWR fuel rods, performed at the Nuclear Safety Research Reactor (NSRR) in February, 1990. Test fuel rod used in the Test TS-2 was a short sized BWR (7x7) type rod which was fabricated from a commercial rod irradiated at Tsuruga Unit 1 power reactor. The fuel had an initial enrichment of

2.79% and a burnup of 21.3Gwd/tU (bundle average). A pulse irradiation of the test fuel rod was performed under a cooling condition of stagnant water at atmospheric pressure and at ambient temperature which simulated a BWR's cold start-up RIA event. The energy deposition of the fuel rod in this test was evaluated to be 72±5cal/g·fuel (66±5cal/g·fuel in peak fuel enthalpy) and no fuel failure was observed. Descriptions on test conditions, test procedures, transient behavior of the test rod during the pulse irradiation, and, results of pre and post pulse irradiation examinations are described in this report. (author).

23370 (NUREG/CR–5672-Vol.3) **Characteristics of low-level radioactive decontamination waste: Annual report for Fiscal Year 1992: Volume 3.** Akers, D.W. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); McConnell, J.W. Jr.; Morcos, N. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 66p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2635-Vol.3). Source: OSTI; NTIS; INIS; GPO.

This document addresses the work performed during fiscal year 1992 at the Idaho National Engineering Laboratory by the Low-Level Radioactive Waste – Decontamination Waste Program (FIN A6359), which is funded by the US Nuclear Regulatory Commission. The program evaluates the physical stability and leachability of solidified waste streams generated in the decontamination process of primary coolant systems in operating nuclear power stations. The data in this document include the chemical composition and characterization of waste streams from Peach Bottom Atomic Power Station Unit 3 and from Nine Mile Point Nuclear Plant Unit 1. The results of compressive strength testing on immersed and unimmersed solidified waste-form specimens from peach Bottom, and the results of leachate analysis are addressed. Cumulative fractional release rates and leachability indexes of those specimens were calculated and are included in this report.

23371 (NUREG/CR–5999) **Interim fatigue design curves for carbon, low-alloy, and austenitic stainless steels in LWR environments.** Majumdar, S. (Argonne National Lab., IL (United States)); Chopra, O.K.; Shack, W.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Argonne National Lab., IL (United States). Apr 1993. 31p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-31109-ENG-38. (ANL–93/3). Source: OSTI; NTIS; INIS; GPO.

Existing data in the literature on fatigue of carbon, low-alloy, and austenitic stainless steels in LWR environments are reviewed. It is found that both temperature and dissolved-oxygen concentration in water significantly affect fatigue life. At the very low dissolved-oxygen levels characteristic of pressurized water reactors and boiling water reactors with hydrogen-water chemistry. environmental effects on fatigue life are modest. However, at higher dissolved-oxygen levels (≥100 ppB), significant reductions in fatigue life can occur. The susceptibility of carbon and low-alloy steels to reduced fatigue life is strongly related to sulfur concentration. Although the fatigue lives of austenitic stainless steels may be reduced, the reductions are much smaller than those observed in high-sulfur carbon and low-alloy steels. In oxygenated water, fatigue life depends strongly on strain rate. Interim fatigue design curves are proposed that take Into account temperature, dissolved-oxygen level in the water, the sulfur level in the steel, and strain rate. Design curves for carbon and low-alloy steels for lives up to 10^6 cycles are also proposed.

23372 (PSI–93-01) **Analyses of reactivity insertion accidents in the Muehleberg boiling water reactor.** Belblidia, L.A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Kallfelz, J.M.; Knoglinger, E. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Jan 1993. [54p.] (STARS–8A.). Order Number DE93626248. Source: OSTI; NTIS; INIS.

In the framework of STARS (simulation models for the transient analysis of the reactors in Switzerland) project, two reactivity insertion accidents in the Muehleberg boiling water reactor at HZP were analyzed. Beyond-design-basis conditions were considered for both accidents, as required by the definition of the task. The first case is the rod-drop accident (RDA), caused by the drop of the highest worth control rod out of the core from a fully inserted position at its maximum velocity. The resulting large reactivity insertion leads to a rapid power surge (terminated by the Doppler feedback) and to large increases in fuel temperatures and enthalpy. The second case is the uncontrolled central rod withdrawal without scram. This is a relatively slow transient compared to the RDA, and when equilibrium is reached the void reactivity predominates in the effects compensating for worth of the withdrawn rod. The analyses are performed with the best-estimate BWR code RAMONA-3B, using a 1/8-th core model, with hot zero power initial conditions. In all cases considered the results for the maximum fuel enthalpy indicate ample margins to the 280 cal/g safety limit. (author) 46 figs., 5 tabs., 37 refs.

23373 (CEA-CONF–11278) **Calculational and experimental investigations of void effect. A new model for leakage treatment of heterogeneous assemblies.** Benoist, P. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie); Petrovic, I.; Mondot, J. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1993. [15p.] (CONF-930404–: International topical meeting on mathematical methods and supercomputing in nuclear applications (M&C+SNA '93), Karlsruhe (Germany), 19-23 Apr 1993). Order Number DE93626259. Source: OSTI; NTIS (US Sales Only); INIS.

The growing interest in safety problems had led physicists to try to increase their knowledge of the neutron leakage phenomenon, both by calculation and by experiment. The flux calculation in a heterogeneous assembly is frequently performed by collision probability method. On the contrary, neutron leakage is calculated for a flux-weighted homogenized assembly, which is a good approximation for a non-voided assembly (PWR in normal conditions). In a LOCA situation, the assembly may contain void zones, and this model for leakage calculation may become insufficient. We propose here a new theoretical model, taking into account the effect of heterogeneity of the assembly on neutron leakage, and which was implemented as TIBERE procedure in the multigroup transport assembly code APPOLO-2. One of the advantages of this new model is to allow a perfectly consistent definition of cell reaction and cell leakage rates used in the equivalence procedure. As well as this theoretical work was made, an experimental program concerning this phenomenon was performed as a part of EPICURE experiment. Comparisons of experimental and calculational results point out better agreement of the new model with the measurements.

23374 (CEA-CONF–11280) **Implicit approximate Riemann solver for two fluid two phase flow models.** Raymond, P.; Toumi, I.; Kumbaro, A. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1993. [17p.] (CONF-9305191–: 3. Nuclear simulation Symposium and mathematical modeling workshop, Schliersee (Germany), 17-19 May 1993). Order Number DE93626260. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes new numerical methods developed for numerical treatment of two phase flow models with two velocity fields now widely used in nuclear engineering for design or safety calculations. These finite volumes numerical methods are based on use of Approximate Riemann Solver's concepts in order to define convective flux vs mean cell quantities. The first part of this paper describes the numerical method for a 3-D drift flux model and extensions performed to make the numerical scheme implicit and to have fast running calculations of steady states. Such a scheme is implemented in the FLICA-4 computer code devoted to 3-D steady state and transient core computations. Results are presented, obtained for a steady state flow with rod bow effect evaluation and for

a Steam Line Break calculation where the 3-D core thermal computation was coupled with 3-D kinetic and thermal-hydraulic transient calculations for the four loops of a PWR. The second part of the paper details the development of an equivalent numerical method based on an approximate Riemann Solver for a two fluid model with two momentum balance equations for the liquid and the gas phases. The main difficulty for these models is due to the existence of differential modelling terms such as added mass effects or interfacial pressure terms which make the model hyperbolic. These terms does not permit to write the balance equations system in a conservative form, and the classical theory for discontinuity propagation for nonlinear systems cannot be applied. Meanwhile, the use of non-conservative products theory allows the study of discontinuity propagation for a non conservative model and this will permit the construction of a numerical scheme for two fluid two phase flow model. These different points are detailed in that section which are illustrated by various significant numerical tests computed with a 1-D model.

23375 (CEA-CONF–11281) **Electrochemical measurements in PWR steam generators to follow crevice chemistry.** Feron, D. (CEA Centre de La Hague, 50 - Cherbourg (France)). CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [6p.] (CONF-9104345–: 1991 JAIF international conference on water chemistry in nuclear power plants, Fukui (Japan), 22-25 Apr 1991). Order Number DE93626261. Source: OSTI; NTIS (US Sales Only); INIS.

In PWR steam generator crevices, the evolution of chemistry is important for the understanding of corrosion phenomena. Electrochemical measurements have been performed in high temperature simulated crevice environments in order to follow hideout processes and remedial actions (on-line addition of boric acid). Reported tests have been conducted with model boilers of AJAX facilities. Eccentric and concentric tube support plate crevices have been instrumented with platinum electrodes. Electrochemical measurements have been collected when model boiler was under nominal conditions (primary temperature: 335 deg C, secondary temperature: 280 deg C). They include Electrochemical Impedance Spectroscopy (EIS) and potential measurements: with EIS, sodium and boric acid hideouts have been detected and followed. Potential measurements have been performed in an attempt to measure crevice PH evolution.

23376 (CEA-CONF–11283) **Solid-liquid equilibrium of the system boric oxide-lithium oxide-water at 300 deg C.** Lambert, I. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [10p.] (CONF-9108114–: 2. international symposium on chemistry in high temperature water, Provo, UT (United States), 19-22 Aug 1991). Order Number DE93626263. Source: OSTI; NTIS (US Sales Only); INIS.

The solid-liquid equilibrium diagram of the system B_2O_3-Li_2O-H_2O is, up to now, known only in the temperature range 25 to 100 deg C. We determined the solubility isotherm in the system B_2O_3-Li_2O-H_2O at 300 deg C for B_2O_3/Li_2O mole ratio from 1 to 600 in solution. The values of saturation concentrations make it possible to predict the behaviour of a possible leak between primary and secondary circuit of nuclear reactors: the results show that at the beginning of the cycle, when the ratio B_2O_3/Li_2O is high, borate precipitation induced by boiling through the leak may lead to occlusion, and that this borate may dissolve when the ratio B_2O_3/Li_2O decreases during the course of the cycle. The solid phases identified by X-Ray diffraction were B_2O_3, $Li_2B_{10}O_{16}H_2O$, $Li_4B_{10}O_{17}$, $Li_2B_4O_7$, $Li_3B_5O_8(OH)_2$, $LiBO_2$. The existence of $Li_3B_5O_8(OH)_2$ was not reported in low temperatures equilibrium systems.

23377 (CEA-CONF–11284) **Impedance study of oxide films formed on zircaloy 4 in high temperature pressurized water.** Bataillon, C.; Brunet, S. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [6p.] (CONF-9110490–: EUROCORR'91, Budapest (Hungary), 21-25 Oct 1991). Order Number DE93626264. Source: OSTI; NTIS (US Sales Only); INIS.

Improvement of the corrosion resistance of fuel claddings in Pressurized Water Reactors (PWR) has received increasing interest over last decade. Moreover, few data concerning dielectric properties, chemical composition and structure of oxide films are nowadays available. The purpose of this paper is to analyze the chemical and physical features of oxide films formed on Zircaloy 4 in conditions similar to PWR exposure and to connect modifications of these features to the change in the kinetic of the oxidation process.

23378 (CEA-CONF–11285) **Stress corrosion cracking behaviour of alloys 600 and 690 in water and caustic solutions.** Helie, M.; Blanchet, J.; Santarini, G. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [6p.] (CONF-9110490–: EUROCORR'91, Budapest (Hungary), 21-25 Oct 1991). Order Number DE93626265. Source: OSTI; NTIS (US Sales Only); INIS.

For many industries, corrosion damages and particularly those due to Stress Corrosion Cracking (SCC) remain one of the most difficult problems to fight as well as to understand for the researcher. The Nuclear Energy Industry is no exception to that rule and the Commissariat a l'Energie Atomique has been studying the stress corrosion cracking phenomenon of nuclear alloys for more than 30 years, phenomenon which is still the subject of a great number of studies among the Nuclear Industrialists. The aim of the following paper is to briefly summarize some results obtained in a study of the SCC behaviour of Alloys 600 and 690 in mediums such as primary water and caustic solution (simulating local conditions of the secondary side) involving, in the case of the Constant Elongation Rate Tests in primary medium, the influence of the temperature, surface state, thermal treatment and strain rate.

23379 (CEA-CONF–11286) **Solubility of cobalt in primary circuit solutions.** Lambert, I. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides); Joyer, F. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1992. [4p.] (CONF-921012–: 6. international conference on water chemistry of nuclear reactor systems, Bournemouth (United Kingdom), 12-15 Oct 1992). Order Number DE93626266. Source: OSTI; NTIS (US Sales Only); INIS.

The solubility of cobalt ferrite ($CoFe_2O_4$) was measured in PWR primary circuit conditions, in the temperature range 250-350 deg C, and the results were compared with the ones obtained on magnetite and nickel ferrite. As in the former cases, it was found that, in the prevailing primary circuit conditions, the solubility of the cobalt ferrite was minimum at temperatures around 300 deg C, for cobalt as well as for iron. The equilibrium iron concentration is significantly lower than in the case of magnetite. The results are discussed in relation with the POTHY code, based only on thermodynamic laws and data, used for the prediction of the primary circuit chemistry.

23380 (CEA-CONF–11287) **Transport of lead in secondary systems of PWR plants: laboratory and plant investigations.** Feron, D. (CEA Centre de La Hague, 50 - Cherbourg (France)); Rocher, A.; Nordmann, F. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1992. [7p.] (CONF-921012–: 6. international conference on water chemistry of nuclear reactor systems, Bournemouth (United Kingdom), 12-15 Oct 1992). Order Number DE93626267. Source: OSTI; NTIS (US Sales Only); INIS.

Both in France and abroad, abnormally high lead concentrations have been found in the deposits on certain steam generator tubes subject to combined inter and transgranular corrosion on the secondary side. Many potential sources of lead have been identified in PWR steam-water system, mainly at the turbine level. Tests on a loop (ORION) have shown that lead (as Pb or PbO) can transport from the condenser to the steam generator and that the contaminant mainly concentrates in flow restricted areas of steam generators.

23381 (CONF-930702–12) **Potential change in flaw geometry during pressurized-thermal-shock transients.** Shum, D.K.M.; Bryson, J.W.; Merkle, J.G.; Keeney-Walker, J.; Dickson, T.L.; Bass, B.R. Oak Ridge National Lab., TN (United States). [1993]. 42p.

Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Pressure vessel and piping conference; Denver, CO (United States); 25-29 Jul 1993. Order Number DE93009709. Source: OSTI; NTIS; INIS; GPO Dep.

This study presents preliminary estimates on the potential change in flaw geometry of an initially shallow, axially oriented, inner-surface finite-length flaw in a PWR-RPV during the course of a postulated PTS transient. Specifically, the question being addressed is whether a shallow, axially oriented, finite-length surface flaw would tend to elongate in the axial direction and/or deepen into the wall of the vessel during the transient. In the first part of the study, estimates are obtained based on the assumptions of linear-elastic material response. The thermo-elastic properties of the cladding and base material are explicitly considered. The flaw geometry corresponds to a family of modified-elliptical flaws characterized by the flaw's half-length to maximum depth (aspect ratio). Requirements for numerical convergence of the finite element results are examined. In the second part of the study, the sensitivity of the numerical results and conclusions obtained in the first part of the study to the following three analysis assumptions are evaluated: (1) Reference flaw geometry along the entire crack front and especially within the cladding region; (2) Linear-elastic versus elastic-plastic description of material response; (3) Base-material-only vs bi-material cladding-base vessel-model assumption.

23382 (EGG-RAAM–10669) **Extensions to the SCDAP/RELAP5 code for the modeling of debris oxidation and materials interactions preliminary design report.** Siefken, L.J.; Davis, K.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 27p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013699. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary designs are proposed for extending the SCDAP/RELAP5 code so that it models (a) the oxidation of slumping fuel rod material and cohesive and porous debris and (b) the interaction of PWR control rod materials with the other materials in a reactor core. These extensions have the purpose of improving the code's calculation of the damage progression and hydrogen production that takes place during the early phase of a severe accident.

23383 (INIS-mf–13502, pp. 28-37) **Safety trends and design progress of future French-German Pressurized Water Reactor.** Ruess, F. (Nuclear Power International SNC, Paris (France)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

Within the cooperation between Framatome SA and Siemens AG in the field of Pressurized Water Reactors, Nuclear Power International (NPI) was established in 1989. The basic objectives of this joint venture are the marketing of PWRs and the development of a common French-German technology for the next generation of PWRs. The organization and the time schedule of the development work are described. Basic safety trends are indicated and the main technical features of this reactor (safety systems on the primary side, secondary-side heat-removal systems, reactor building and containment, instrumentation and control) are outlined, as they are proposed today to the French and German utilities by NPI, Framatome and Siemens. Tentative safety probabilistic target: no family of events should lead to a core melt frequency higher than 10^{-7}/year and the overall core melt frequency should not be higher than 10^{-6}/year. The overall strategy for severe accidents is defined in such a way that the probability of high pressure core melt scenarios should be reduced by providing a highly reliable secondary-side heat removal and safety-grade primary bleed functions to a level significantly below 10^{-7}/year. (Z.S.) 6 figs.

23384 (INIS-mf–13502, pp. 38-50) **Staff training and education: Eastern point of view.** Dugovic, M. (Vyskumny Ustav Jadrovych Elektrarni, Trnava (Czechoslovakia)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The establishment of a unified system of nuclear power plant personnel training started in Czechoslovakia in 1979. Basic phases of the development of plant personnel training are described and an evaluation of the existing system presented. The use of a full-scale simulator in training is described and the basic conceptual design features given. The present trends in the field of personnel training are described. (Z.S.) 8 figs.

23385 (INIS-mf–13502, pp. 74-78) **Safety culture in the operation of nuclear power plants in CSFR.** Suchomel, J. (Vyskumny Ustav Jadrovych Elektrarni, Trnava (Czechoslovakia)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

Three aspects are discussed of safety culture in the operation of nuclear power plants in Czechoslovakia, namely, the rewards and sanctions, the individual attitudes and procedures, and plant safety experience as defined in Sections 3.2.4, 4.2.2.2 and 4.2.2.3, respectively, of the IAEA report on Safety Culture by the INSAG, 1991. (Z.S.).

23386 (INIS-mf–13502, pp. 79-80) **Introductory statement for the panel discussion 'Safety Culture in Plant Operation and Maintenance'.** Vamos, G. (Paksi Atomeroemue Vallalat, Paks (Hungary)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The problem areas are dealt with of the Paks nuclear power plant operational practice from the point of view of safety culture. (Z.S.).

23387 (INIS-mf–13502, pp. 81-92) **Maintenance organization and outage planning in NPPs.** Nikolayev, V. (Russian Federation Nuclear Society, Moscow (Russian Federation)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The Nuclear Society of the Russian Federation is responsible for all commercial electric power generation in nuclear power plants in Russia (ie., 9 nuclear power plants), and for managing several maintenance enterprises and other technical support organizations. The current status is presented of the maintenance policy and the organization of the maintenance. The impact of maintenance on the reliability of the nuclear power plant systems, and the methods for developing maintenance improvement practices are described. (Z.S.) 4 figs.

23388 (INIS-mf–13502, pp. 93-106) **Preparing and organizing inspection and maintenance.** Vuorenmaa, A. (Imatran Voima Oy, Loviisa (Finland). Loviisa Power Plant). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and*

reliable operation of LWR NPPs. Vol. I: Invited plenary session papers. [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The philosophy and goals of maintenance are discussed. The main principles in organizing the maintenance of the Loviisa power plant are: the people responsible for maintenance during operation are also responsible for maintenance during outages; outside contractors are used for the peak loads during outages but the planning and monitoring of outages is the responsibility of the plant personnel. Technically skilled and highly motivated personnel is the most important prerequisite of success. Loviisa has for several years very successfully utilized two different types of salary bonus system. The reloading outage bonus system gives more money per hour during the outage and an additional increase for all plant people participating in the outage work, if the duration of the outage is shorter than planned. The amount of the extra bonus depends on the final duration of the outage. The operation and maintenance of the Loviisa plant is based on quality assurance, operation and maintenance procedures. The annual and long-term plan of actions are controlled by regular planning meetings which utilize all reports produced by the maintenance groups. The technical outage report contains all technical information gathered during the outages according to the preventive maintenance and in-service inspection programs. The condition monitoring programs of the plant components were developed by the Research Laboratories of Imatran Voima and financed by the plant. (Z.S.) 9 figs., 5 refs.

23389 (INIS-mf–13502, pp. 107-118) **Steam generator replacement - European experience.** Bacot, J. (EdF CIG, Marseille (France)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The susceptibility of steam generator tube bundles to corrosion is a major concern of operators of PWR nuclear power plants. Since 1980 they have been led to undertake several steam generator replacement operations in the US and in Europe: since Surry 2 in 1980, 13 operations were performed including Obrigheim (1983), Ringhals 2 (1989), Dampierre 1 (1990) in Europe; almost the same number of operations are planned for the period up to 1995, including Bugey 5 (1993), Doel 3 (1993), Ringhals 3 (1995), Tihange 1 (1995), Gravelines 1 (1994 or 1995), Asco 1 or Almaraz (1995) for Europe. A brief description of each project and the main European projects is given. Replacement of the entire steam generator in one piece appears to be the dominant technology in European projects. The current trend is to use mechanical cutting techniques for primary pipe cutting, and the narrow-gap welding technique. The method of fitting up progressed from the two, three or four-cut processes when a cut change is not required. The tube material used is thermally-treated Inconel 690 or Incoloy 800. The major changes in the steam generator design are summarized. (Z.S.) 6 refs.

23390 (INIS-mf–13502, pp. 119-123) **Replacement of process computer during full power operation.** Kroon, J. (KCB, Borssele (Netherlands)); Loos, C. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The Borssele nuclear power plant was delivered in 1973 with a Siemens 306 process computer. 3000 logical signals and 400 analogs were connected to the computer. In 1984 the decision was made to replace the system with a new Process Presentation System. The new system was installed in 1988 and 1989. It originally consisted of three levels: (1) the Data Acquisition level equipped with Cegelec T20 controllers; (2) a Bull SPS-5 Data Base processor and Man-Machine Interface controller, with software based on Cegelec T20-Centralog design; (3) a concurrent 3680 Applications Processor. Levels 2 and 3 consist of two redundant trains with fully automatic fail-safe software. The system has a capacity of handling 1200 analog signals and 6000 logical signals. Soon after delivery of the system, the projected reserve capacity was already fully charged. In 1992 a fourth level was introduced. The projected backfitting projects will cause a demand for connection of additional signals. The increase in data handling capacity requires the replacement of the level 2 computers. Due to the limited amount of functions of the old process computerm the exchange can be done during normal power operation. (Z.S.).

23391 (INIS-mf–13502, pp. 124-134) **Upgrading requirements.** Govaerts, P. (AV Nuclear, Bruxelles (Belgium)); Dresse, H.; Roch, M. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

Belgium was the first country in the world to have required in the operating license of each nuclear power plant, a safety reassessment on a periodical basis (10, 20, 30...years) after the plant has reached its nominal power. The utility and the safety authority jointly proceed with a comparative examination of the design, construction, operating rules and procedures of the existing plant with respect to the current rules and practices in use in the U.S. and in the European Community at the time of the review. As a technical support to the competent authorities, supervising nuclear safety, AV Nuclear is in charge of that examination and acts as the regulatory body. The report is presented to the ministries supervising nuclear safety and to the Belgian Nuclear Safety Commission. After their approval the report is referenced in the operating licenses of the plant and the utility must comply with it. Described are the types of review during plant operation, the objectives of periodic safety reassessments, and the safety reassessment of the units Doel 1, 2 and 3 and Tihange 1 and 2. The first safety reassessments performed for the Belgian plants resulted in a very extensive re-analysis of the safety of the plants, and the adoption of consistent modifications. (Z.S.) 3 refs.

23392 (INIS-mf–13502, pp. 159-170) **Innovation of safety systems of the V-1 Bohunice plant.** Rohar, S. (Vyskumny Ustav Jadrovych Elektrarni, Trnava (Czechoslovakia)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

In 1990 several reviews were carried out of the operational safety of the V-1 nuclear power plant at Jaslovske Bohunice. As a result, short- and long-term measures for upgrading the safety of the units were recommended. The extent of the ongoing backfitting programme, to be completed by the end of 1992, is assessed to cost approximately 15% of the original initial investment costs for the construction of the V-1 plant. The objectives of the safety system innovation programme (active and passive emergency core cooling systems, confinement system for accident localization, superemergency feedwater of steam generators, emergency on-site sources of power supply) are described. The design reliability of the ECCS expressed in terms of the probability of failure is specified at the maximum level of 10^{-3} per reactor-year which is the level used in the design of western nuclear power plants. The strategic intention of the whole backfitting of the V-1 plant is to obtain the probability of severe core damage lower than 10^{-4} per reactor-year. (Z.S.) 2 figs., 1 ref.

23393 (INIS-mf–13502, pp. 198-210) **SIPA-SWORD: a 'configurable' simulator for safety.** Guinard, E. (EdF, Paris (France). Nuclear and Fossil Generation Division); Houdayer, G.; Poizat, M.F. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society,

Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

SIPA means 'Post Accident Simulator'; it attempts to account for the dynamic behavior of a Pressurized Water Reactor between two instants: from the moment the accident occurs till - but not including - the possible meltdown of the nuclear fuel, this requiring other hypotheses and algorithms. SIPA was made to a double specification: (1) to satisfy the needs of the utility EdF(SPT) in terms of training, by making use of a relevant and pedagogical tool for accident situations in real time, for the use of Shift Safety Advisors (SSAs), Shift Teams and Crisis Teams; (2) to satisfy the needs of the designer EdF(SEPTEN) in terms of safety studies by means of a tool making it possible with greater ease and efficiency to deal with the instruction of the systems making up the unit, validate the control procedures and perform crisis drill scenarios. Meeting with initial specifications of training for accidents which cause violent thermohydraulic disturbances, two 'SSA training configurations' have been developed for the 34 EdF 900 MW reactors, with almost identical primary circuits, and the 20 EdF 1300 MW reactors. Both of these are organized around the main CATHARE-SIMU code, which thereby determines the domain in which SIPA will be used. SIPA was commissioned on December 23, 1991. The first version, installed at EdF-SEPTEN, Lyon, is called SIPA 1 and has been used for training since June 1, 1992. (Z.S.) 3 tabs., 5 figs.

23394 (INIS-mf–13502, pp. 211-223) **Development of an effective man-machine interface for the Sizewell B main control room.** Wright, P.J.G. (Nuclear Electric plc (United Kingdom)); Leach, M.G. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

Sizewell B, currently under construction, is the first pressurized water reactor power station to be built in the UK. Although the design is based on the SNUPPS design, which operates very successfully at Callaway and Wolf Creek in the USA, several changes have been made to meet UK licensing requirements and improve safety. These changes include an entirely new control room design which takes advantage of modern control and instrumentation technology to provide the operator with a more effective interface with the plant. A brief description is given of the way in which the design of the Sizewell B control room has been developed. The design is presented of the control room layout, data display system, plant overview panel, main control suite, general service panel, electrical services panel, document and auxiliary monitoring facility. (Z.S.) 3 figs.

23395 (INIS-mf–13502, pp. 224-235) **Overview on development of in-plant emergency operating procedures.** Wanner, A. (Electrowatt Engineering Services Ltd., Zurich (Switzerland)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

An analysis of the existing Emergency Operating Procedures (EOPs) - based on a single event, design basis accident approach - has shown that they are inadequate to cope with unforeseen accident scenarios and should be extended to cover a wider range of accident conditions. EOPs that cover the expanded range are also called 'Accident Management Procedures' (AMPs) and form an important part of the overall plant accident management strategy. A brief overview is presented of the current status of the EOPs and AMPs that were developed during the recent years by some of the major power reactor suppliers and operators (Westinghouse, EdF, Siemens(KWU)). (Z.S.) 3 figs.

23396 (INIS-mf–13503) **Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.** European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. [245p.] (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Out of the 54 poster papers contained in the proceedings, 53 were inputted to the INIS system. The topics covered include operational training and simulation, inspection, maintenance and component replacement, backfitting experience, instrumentation, man-machine interface, software and procedures. (Z.S.).

23397 (INIS-mf–13503, pp. 4-7) **Three-dimensional reactor model for the Paks NPP full-scope simulator.** Gyori, C. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Hegyi, G.; Hozer, Z.; Kereszturi, A.; Maraczy, C. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The reactor model includes thermohydraulic and neutron-physical components. The thermohydraulic model is based on the SMABRE code developed at the Technical Research Centre of Finland for the analysis of loss-of-coolant transients in PWRs. The fuel rod model will be replaced by a new software module providing a comprehensive description of the behavior of fuel rods during reactor transients and hypothetical accidents. The calculation is performed in four individual models: fuel rod temperature model, fuel rod internal pressure model, fuel rod deformation model and fuel rod failure model. In the neutron-physical model the core is calculated with nodes for all of the 349 fuel assemblies, and each assembly is calculated in ten layers. (Z.S.) 1 fig., 5 refs.

23398 (INIS-mf–13503, pp. 16-23) **STRATEG - an incident training system for thermohydraulic effects and principles.** Rehn, H. (Nuklear-Ingenieur Service GmbH, Hanau (Germany)); Majohr, N. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

STRATEG is a 1:10 scale glass model of a PWR (Biblis B reactor coolant circuit) built by RWE in 1986 on the site of the Biblis plant as a training model. The model can be used for training of normal operation and incident situations since all important operating and incident sequences of a PWR can be simulated. Thermodynamic phenomena can also be demonstrated occurring under various operating situations and in particular associated with malfunctions. (Z.S.) 1 tab., 3 figs., 1 ref.

23399 (INIS-mf–13503, pp. 31-34) **The extension of the Paks full-scale simulator to severe accidents.** Vegh, E. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Janosy, J.S. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A second model upgrading started in 1991 and will be completed by the end of 1992. In the simulator, the whole primary circuit system with its auxiliary systems is replaced. The most significant

improvements are: a detailed 3D reactor model; thermohydraulics of the primary circuit; detailed containment and pressure suppression system models; a fuel element model, radioactivity transport in the primary circuit and in the containment. (Z.S.) 2 figs., 3 refs.

23400 (INIS-mf–13503, pp. 35-38) **Organizational aspects of recruiting, training, maintaining the level of professional skills and retraining of NPP operations personnel in Russia.** Veltchinsky, V. (Russian Research Institute of Nuclear Power Plant Operations (Russian Federation)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The organization of personnel work during WWER-1000 operation is presented as recommended by the Russian operating organization. The system is described of recruiting, training control of professional activities, maintaining of professional skills and retraining of the Russian nuclear power plant operation personnel (PKPO system). The basic documentation of the PKPO system is listed. (Z.S.) 1 fig.

23401 (INIS-mf–13503, pp. 39-42) **Detailed containment model for the Paks NPP full-scope simulator.** Vigassy, J. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The modelling principles in simulating the containment behavior are presented. The following processes are considered in containment simulation: thermohydraulic processes in the rooms and trays of the containment; detailed heat kinetics of the walls; behavior of the depressurization and ventilation systems; failures in the containment; distribution of air, steam/water, hydrogen and boric acid; the amount of radioactive contaminants in the sealed room systems. (Z.S.) 2 figs.

23402 (INIS-mf–13503, pp. 46-49) **Inspection validation and its role in the UK nuclear power programme.** Conroy, P.J. (AEA Technology, Warrington (United Kingdom). Inspection Validation Centre); Smalley, S. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A summary of the validation trials is given conducted in support of the ultrasonic inspections covering the various fabrication stages of the UK's Sizewell 'B' PWR pressure vessel. The validation programme has provided strong evidence that the ultrasonic inspections carried out by validated operators using validated procedures will achieve a standard of inspection that will ensure that the reactor pressure vessel enters service free from any credible defects and that during the service life of the vessel any credible in-service defects that may develop to threaten the integrity of the pressure vessel will be identified by the periodic in-service inspections. (Z.S.) 1 tab., 1 fig.

23403 (INIS-mf–13503, pp. 50-55) **In-service inspection of WWER steam generators.** Guenon, Y. (Intercontrole (France)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

In July 1990, INTERCONTROLE supplied Atomenergoremont with two eddy current systems (GIBBON robot) for inspecting steam generator tubes in Soviet WWER-type reactors. The robot accesses and inspects all tubes in a cylinder section of 800 mm over 90 degrees and gets round plugged tubes either by rotation or by vertical displacement. The eddy current inspection system is controlled from a mobile shelter located 200 m from the steam generator. The control system controls all subsystems on the GIBBON and axial rotating probe drives on an AT personal computer. The unique data acquisition features include the HARMONIC 210 eddy current instrument and data acquisition and verification software. Verification of axial and rotating probe data is based on AIDA, DESIREE and ESTELLE software, developed jointly by INTERCONTROLE and EdF. (Z.S.) 4 figs., 1 ref.

23404 (INIS-mf–13503, pp. 60-63) **A computerized event and maintenance data system at Loviisa nuclear power plant.** Jankala, K.E. (Imatran Voima Oy, Vantaa, (Finland)); Saarelainen, P.; Vaurio, J.K. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

An on-line failure and maintenance event data system (which is a part of the Loviisa power plant information system) is described as developed and implemented at the Loviisa power plant. The system has been in operation since 1989, and the data base now covers more than 10 years of operation. The system contains a complete unavailability history, i.e. failures, repairs, replacements, scheduled or unscheduled preventive maintenance and periodic testing or service actions for any component that is relevant to plant safety, risk or economic production. The data base provides useful feedback from operating experience and can support e.g. studies on optimal maintenance and testing, planning of spare parts inventory and repair resources, updating of reliability parameters for risk studies, etc. (Z.S.) 4 refs.

23405 (INIS-mf–13503, pp. 68-71) **Inspection and repair of nuclear components.** Lahner, K. (ABB Reaktor GmbH, Mannheim (Germany)); Poetz, F. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Despite careful design, manufacturing and operation, some of the important safety-relevant components show deterioration with time. Because of activation and contamination of these components, their inspection and repair has to be performed with manipulators. Some sophisticated manipulators are described, built by ABB Reaktor and used for inspection, maintenance and repair of PWR steam generators, fuel alignment pins, core baffle former bolts and reactor pressure vessel head penetrations. (Z.S.) 7 figs.

23406 (INIS-mf–13503, pp. 96-99) **Validation of emergency procedures for improved safety and reliability.** Boucau, J. (Westinghouse, Brussels (Belgium)); Bock, C. de. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Westinghouse together with operation people from the Westinghouse Owners Group (WOG) has been working since 1981 on the development of Emergency Response Guidelines (ERG's). The

ERG's have been constructed to be generic and applicable to all Westinghouse designed PWR plants. The post-accident recovery technique of small break LOCA is described based on the guideline prescribed in the ERG's. It demonstrates that plant specific analyses are quite efficient to improve emergency procedures, especially in case of non-standard plants, like WWER's. For such plants, it is recommended to verify the correctness of the post-accident recovery technique with a tool that can interactively simulate the operator actions, with best-estimate assumptions. Such analyses also provide the plant personnel with plant specific background documents that are quite convenient for their training on emergency procedures. (Z.S.) 1 fig.

23407 (INIS-mf–13503, pp. 104-110) **The Belgian experience with the safety reassessment of nuclear power plants.** Damsin, M. (Belgatom SA, Brussels (Belgium)); Danhier, B. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

In Belgium, the safety reevaluation of operating nuclear power plants is due by law after each ten-year period of operation of a plant. Belgium has gained valuable experience in this particular field during the reevaluation of their three oldest nuclear power plants. The Belgian approach to the safety reassessment of nuclear power plants is described (methodology, process of safety reevaluation studies) and two examples are presented, i.e. the Tihange-1 seismic reevaluation and the Doel 1/2 emergency systems including cost evaluation. (Z.S.).

23408 (INIS-mf–13503, pp. 111-114) **Steam generator replacement at Doel 3 NPP (Belgium).** Danhier, B. (Belgatom SA, Brussels (Belgium)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The reasons are presented that led to the conclusion that the most cost-effective strategy for the Doel 3 unit was the immediate replacement of the SG. Discussed are the advantages and drawbacks of the replacement techniques, the so-called 2, 3 and 4 cuts methods. The advantages are emphasized of intensive use of computer aided engineering in this kind of backfitting. The methodology applied to combine a power uprating of 10% over the nominal power with the steam generator replacement is presented. (author) 1 fig.

23409 (INIS-mf–13503, pp. 115-118) **PWR reload safety evaluation methodology.** Doshi, P.K. (Westinghouse Electric Corp., Pittsburgh, PA (United States)); Chapin, D.L.; Love, D.S. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The current practice for WWER safety analysis is to prepare the plant Safety Analysis Report (SAR) for initial plant operation. However, the existing safety analysis is typically not evaluated for reload cycles to confirm that all safety limits are met. In addition, there is no systematic reanalysis or reevaluation of the safety analyses after there have been changes made to the plant. The Westinghouse process is discussed which is in contrast to this and in which the SAR conclusions are re-validated through evaluation and/or analysis of each reload cycle. (Z.S.).

23410 (INIS-mf–13503, pp. 119-122) **Hydrogen management techniques in German LWR-containments.** Berg, H.P. (Bundesamt fuer Strahlenschutz, Salzgitter (Germany)); Froehmel, T. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Investigations are described which are necessary to develop an accident management concept for German PWRs, in particular possible solutions of the hydrogen problem resulting from a core melting accident. This work is an important part of the Nuclear Regulatory Research Programme initiated and financed by the Federal Office for Radiation Protection (BfS). Two fundamental strategies are discussed: prevention of the formation of inflammable gas mixtures by making the atmosphere of the containment inert, and mitigation of the consequence of possible combustion by limiting the local hydrogen concentration. (Z.S.) 1 fig.

23411 (INIS-mf–13503, pp. 132-134) **The model experiments on the stationary outflow in the retaining system.** Kucak, L. (Slovenska Vysoka Skola Technicka, Bratislava (Czechoslovakia). Strojnicka Fakulta). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The existing protection system for WWER-type nuclear power plants was designed to cope with a rupture of the pipeline with diameter less than 200 mm. The new requirements on the protection system, ie., to retain accident product outflow from the 500 mm main circulation pipe represent a great technical problem. In order to obtain data for designing a new primary pipe accident retaining system for the Bohunice V-1 power plant with overpressure not exceeding 100 kPa, model experiments were carried out. Basic features of the experiments are given. (Z.S.) 1 fig.

23412 (INIS-mf–13503, pp. 135-141) **Measures taken to improve nuclear safety on EdF PWRs in operation.** Kus, J.-P. (Electricite de France CNIPE, Lyon (France)); Norvez, G. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

In parallel with its major nuclear programme (56 PWR units in service or under construction), France has developed an original philosophy in the field of Nuclear Safety. This comprehensive philosophy ensures a fine balance and coordination between design and operation, it provides a methodology to design, construct and operate a safe nuclear plant. Actual experience is then continuously compared to the initial expectation and the methodology refined whenever necessary. This methodology is fully applied to the new 1400 MWe plant series presently under construction. The essential elements are also backfitted into all previous units, thereby giving them an equivalent level of safety. The French PWR park can therefore be considered as very homogeneous with regard to its safety level, regarding both its design and operation. (author).

23413 (INIS-mf–13503, pp. 142-144) **Electrical penetrations for use in WWER nuclear power plant containment vessels.** Lankenau, W.R. (Imaging and Sensing Technology, Horseheads, New York (United States)); Forejt, V. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia),

18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A description is given of the electrical penetration assembly designed by Imaging and Sensing Technology (USA) for the Temelin nuclear power plant. (Z.S.) 1 fig.

23414 (INIS-mf–13503, pp. 145-149) **Backfitting experience, Loviisa nuclear power plant, Finland.** Mohsen, B. (IVO International Ltd, Vantaa (Finland)); Vaurio, J. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Some examples of major backfitting planned for Loviisa or already carried out are described. The level 1 probabilistic safety assessment (PSA) was completed in 1989 for the internal initiators of Loviisa power plant, unit one. The results of PSA analysis demonstrated among other things the need to treat three types of initiators: loss of safety instrument cooling room, primary to secondary leaks, and loss of off-site power. The following examples of deterministically based backfitting are given: standby emergency feed water system and containment external spray. The Loviisa PSA analysis for internal events, which is so far the first performed for WWER-type reactors, is being continuously updated and used as a living PSA for decision making. Very essential modifications were carried out or are under way of both hardware and procedures. Fire, flood and level 2 analysis are under way and will be finished in the near future. (Z.S.) 5 figs.

23415 (INIS-mf–13503, pp. 150-155) **Seismic assessment of Kozloduy WWER-440, model 230 nuclear power plant.** Monette, P. (Westinghouse Energy Systems International, Brussels (Belgium)); Baltus, R.; Yanev, P.; Campbell, R. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A preliminary report is given of the findings of an IAEA sponsored walkdown of the WWER-440, model 230 at Kozloduy, in May 1991. The scope of the IAEA mission was to determine the lower bound seismic capacity of the plant and to make recommendations for improvements to increase the earthquake resistance. The methodology utilized in the assessment is that used for evaluation of the seismic margin in U.S. nuclear power plants subjected to earthquakes beyond their design basis. Included in the assessment is the establishment of a safe shutdown path which would include the capacity to mitigate a small break in the primary system, performance of a walkdown of the safe shutdown path and calculation of the high-confidence-of-low-probability-of-failure (HCLPF) of the safe shutdown path. Excluding system design deficiency relative to U.S. and Western Europe standards, it was found that the plant has many seismic vulnerabilities similar to those that existed in many of the U.S. plants prior to about 1979 when the Systematic Evaluation Program was initiated. (Z.S.) 1 tab., 1 fig.

23416 (INIS-mf–13503, pp. 156-159) **Development of MAAP-WWER.** Prior, R.P. (Westinghouse Energy Systems, Brussels (Belgium)); Plys, M.G. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The Modular Accident Analysis Program (MAAP) is a tool for modelling the response of a light water reactor plant to severe accidents. It is now widely used for many applications in the U.S., Western Europe and Japan. In the near future, a number of safety studies of WWER type reactors designed in the former USSR will be performed. A summary is provided of the development effort underway to enable MAAP code to model these reactor types. Presented are a brief review of the MAAP code, a summary of the new modelling effort, and applications foreseen for the new version of the code. The WWER-440 version of MAAP, completion of which is scheduled for the third quarter of 1992, will be needed to perform WWER safety assessments, in particular: level 1 PSA (success criteria, event sequence definition), level 2 PSA (event sequence definition, source term analysis), assessment of confinement performance, source term and radiological consequence analyses, system evaluations, including the thermal shock of reactor vessels. (Z.S.) 1 fig.

23417 (INIS-mf–13503, pp. 166-169) **Nuclear power plant safety under military threats.** Stritar, A. (Institut Jozef Stefan, Ljubljana (Yugoslavia)); Mavko, B. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The Krsko nuclear power plant in Slovenia was probably the first in the world that found itself in the middle of a war region. A number of preventive measures performed during and immediately after the war in summer 1991 by the plant personnel as well as some of related activities of the Reactor Engineering Division of the 'Jozef Stefan' Institute are described. All efforts were aimed at the minimization of the possible public radiological consequences during a military attack. The critical safety functions in such conditions were checked. Concern was further devoted to maintenance of the core cooling in the core and to integrity of the spent fuel pit. The cold shutdown mode was found to be the most appropriate option. After selecting the cold shutdown mode as a most suitable operational state of the plant, further studies of the vulnerability were done. In addition to possible direct damage to structures, that would cause release of radioactivity, two important subjects were considered: AC and DC power supply and the ultimate heat sink. A quick analysis during the crisis has shown that the consequences of a military attack against the plant by jet fighters could be serious, but with the proper preventive measures and preparedness the environmental consequences could be minimized. (Z.S.) 1 fig., 1 ref.

23418 (INIS-mf–13503, pp. 174-184) **The Westinghouse approach - an I and C modernization program for WWERs.** Werner, C.L. (Westinghouse Electric Corp., Pittsburgh, PA (United States)); Wassel, W.W.; Novak, V. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

When entering into a design program that is a marriage between two designs it is very difficult to separate self imposed design criteria from the requirements of the program. Therefore, the criteria of and the requirements for the Westinghouse modernization program will be discussed as one. These are outlined below: (1) The OSART Mission that was conducted by the IAEA at the Temelin Plant in 1990 identified the need to provide a new comprehensive Safety Analysis to verify the various aspects of the WWER safety system design. This recommendation is one that Westinghouse will provide as part of the WWER I and C Modernization Program. The design, no matter how well proven or verified from a hardware design point of view, is only as good as the basis for the system design; (2) Minimize the impact on the civil design aspects of the plant where possible and where this requirements do not affect the safety features of the design; (3) Ensure compatibility of the design to meet the latest US NRC requirements and those of the implementing country, applicable to the systems functional and hardware designs. This is a Westinghouse standard corporate requirement for

all nuclear plant and systems design whether they be foreign or domestic; (4) Provide the most modern, proven design for the I and C systems. Application of the Westinghouse Instrumentation and Control microprocessor based design to the WWER Modernization Program will provide the basis for upgrading plants to meet western standards. (author) 6 figs., 1 ref.

23419 (INIS-mf–13503, pp. 185-186) **French load follow technology.** Bruyere, M. (Framatome, La Defense (France)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Since the early 80's, PWR units in France had to evolve from base load operation to intensive load follow operation. Information is given on the set-up programme, the technical improvements implemented, the licensing efforts and the experience gained during years of load follow operation in France. (Z.S.).

23420 (INIS-mf–13503, pp. 195-199) **Development of an intelligent CAI system for a distributed processing environment.** Fujii, M. (Mitsubishi Electric Corp., Amagasaki (Japan)); Sasaki, K.; Ohi, T.; Itoh, T. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

In order to operate a nuclear power plant optimally in both normal and abnormal situations, the operators are trained using an operator training simulator in addition to classroom instruction. Individual instruction using a CAI (Computer-Assisted Instruction) system has become popular as a method of learning plant information, such as plant dynamics, operational procedures, plant systems, plant facilities, etc. The outline is described of a proposed network-based intelligent CAI system (ICAI) incorporating multi-medial PWR plant dynamics simulation, teaching aids and educational record management using the following environment: existing standard workstations and graphic workstations with a live video processing function, TCP/IP protocol of Unix through Ethernet and X window system. (Z.S.) 3 figs., 2 refs.

23421 (INIS-mf–13503, pp. 200-203) **DIMOS: a new generation of nuclear power plant process monitoring systems.** Vlaminck, M. de (Belgatom SA, Brussels (Belgium)); Gilliot, B.; Remacle, J. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A new generation of nuclear power plant supervision systems is described, called DIMOS (DIstributed MOnitoring System). It was installed in August 1991 at the Doel nuclear power plant and is now monitoring reactors 1 and 2. The system represents one of the largest and most advanced process monitoring systems in operation. DIMOS has successfully provided the solution to the old system's limitations such as functional deficiencies, low response time, management and coherence of the data, maintenance costs, spare parts, and system availability. The use of the software development methodologies HOOD and ADA have not only allowed a rapid integration and installation of a robust system, but will also make further developments and improvements possible with maximum flexibility. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The main part of the radiation monitoring system at a WWER-440 (213 reactor type) nuclear power plant is the centralized 400-channel monitoring system 'SEJVAL' servicing twin reactor units. The SEJV2 software package is described developed to run on a PC with an IFS2 interface to the SEJVAL radiation monitoring system. It provides enhanced data presentation, record keeping and report generation, thus improving the efficiency of the health physics shift. The system was for the first time implemented at the Jaslovske Bohunice V-2 nuclear power plant with encouraging results. (Z.S.) 3 refs.

The Westinghouse BEACON online monitoring system has been developed to provide continuous core monitoring and operational support for pressurized water reactor using movable detectors (fission chamber) and core thermocouples. The basic BEACON core monitoring methodology is described. Traditional WWER reactors use rhodium fixed in-core detectors as the means to provide detailed core power distribution for surveillance purposes. An adapted version of the BEACON advanced core monitoring and support system is described which seems to be, due to the different demand/response requirements, the optimal solution (for routine surveillance and anomaly detection) for WWER reactors with existing fixed in-core detectors. (Z.S.) 4 refs.

23424 (INIS-mf–13503, pp. 221-224) **Operator aid systems under critical circumstances.** Perrot, J. (CEGELEC, Levallois-Perret (France)); Prud'homme, G. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Under the leadership of the Nuclear Regulatory Commission, design criteria for operator information in control rooms were issued and were made mandatory for all nuclear plants in the United States. The main criteria are given in nuclear regulation (NUREG) document 696 regarding the safety parameter display system (SPDS), and in NUREG 0654 regarding the radiological release and dose assessment display (RRDAD). Subsequently information display systems were added or complemented to the safety assessment. In 1990, CEGELEC together with the Korean Company Hyundai Electronic Industries was chosen to implement such a system on each of the eight PWR units under operation. The systems, called Operator Aid Computer Systems (OACS) for the Korean project under way, are already partly delivered and will be fully commissioned in 1993. The four groups of functions provided by OACS are described, i.e., those related to supervision, to SPDS, RRAD and other functions. The main characteristics of the system are given. (Z.S.).

23425 (INIS-mf–13503, pp. 225-228) **A new advanced software platform for nuclear power plant process information systems.** Sorsa, A. (ABB Stromberg Power Ltd., Helsinki (Finland). Control Systems Division). European Nuclear Society (ENS), Bern

(Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

In the late 80s, ABB Stromberg Power Ltd. started the development of a new generation software platform for the power plant Process Information System (PIS). This development resulted in a software platform called Procontrol PMS. Procontrol PMS is a platform for fully distributed systems which provides the following features: distributed data processing, non-stop architecture, low-cost incremental expansion path, open network architecture, high functionality, effective application development environment, and advanced user interface services. A description of the structure of the Procontrol PMS software is given. ABB has received by May 1992 six orders for nuclear power plant PISs based on Procontrol PMS (4 for PWR plants, 2 for BWRs). The first Procontrol PMS based nuclear power plant PIS was commissioned in 1989 at the Loviisa nuclear power plant and has been running with 100% availability since the commissioning. (Z.S.) 2 figs.

23426 (INIS-mf–13503, pp. 229-232) **A new diagnostic concept for the primary circuit of WWER 1000 reactors.** Streicher, V. (Siemens AG, Erlangen (Germany)); Liska, J. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The new concept developed by the Skoda and Siemens companies is based on their own experience, the requirements of the Czech Power Board/NPP Temelin Diagnostic Department, and on the research work of various institutes in Czechoslovakia. The development of a complex diagnostic concept is an iterative process and includes parts with different stages of experience and different goals. They can be divided into five groups: PC-based diagnostic systems with continuous or periodic functions, equipment for condition monitoring, PC-based data collectors, studies, analyses and measures which are mandatory for the correct performance and interpretation of the diagnostic systems, and the integration of all subsystems and data acquisition/evaluation units into a Local Area Network with a graphic workstation. (Z.S.) 2 figs., 4 refs.

(CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A description is given of how the Loviisa nuclear power plant has utilized computers in many ways in the operation, maintenance, technical support and in other functions at the plant. The evolution of the computer system can be divided into the following phases: plant commissioning (1975-80), maintenance systems development (1981-84), second generation systems take-over (1985-90) and workstation client/server systems and PC's proliferation (1991->). A short description is given of the main systems at the Loviisa plant using computers, i.e. process computer systems, the plant information system, training simulator, vibration monitoring, laboratory computer systems, PC and workstation applications. (Z.S.) 4 refs.

23428 (JAERI-M–93-008) **Analysis of ROSA-IV/LSTF experiment simulating the Mihama Unit-2 steam generator U-tube rupture incident by using RELAP5/MOD2 code.** Watanabe, Tadashi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kukita, Yutaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 28p. (In Japanese). Order Number DE93797597. Source: OSTI; NTIS; INIS.

The analysis of the ROSA-IV/LSTF experiment, Run SB-SG-06, simulating the Mihama Unit-2 steam generator tube rupture (SGTR) incident was performed by using the RELAP5/MOD2 code. The objectives of the analysis are to assess the code and the input data for SGTR experiment analyses, and to evaluate the predictive capability of the code for the characteristic phenomena in SGTR incidents. Major transient parameters including break flow rate, primary pressure, fluid temperatures and natural circulation flow rates, were predicted very well, while the SG secondary side liquid levels and pressure increase in the broken SG secondary sides were overestimated. These are probably due to a relatively rough noding in the SG secondary side used in the analysis and to the limitation in the vertical stratification model of the code. The steam in the pressurizer was found in the analysis to penetrate into the hot leg after loss of pressurizer liquid level, as was observed in the experiment. The void fraction in the hot leg was, however, underestimated. The flow regime in the hot leg during this period was bubbly, and the stratified flow seen in the experiment was not calculated. This is because the calculated steam velocity in the hot leg was larger than the criterion for the horizontal stratification. (author).

23429 (KFKI–1992-17/G) **'Kazmer' a complex noise diagnostic system for 1000 MWe PWR WWER type nuclear power units.** Por, G. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Sokolov, L.A. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Jun 1992. [19p.] Order Number DE93626268. Source: OSTI; NTIS (US Sales Only); INIS.

Noise diagnostic systems have previously been developed and installed for the WWER-440 type reactors at the Paks Nuclear Power Plant, Hungary. Based on the experiences, the system has been extended and modified for use in 1000 MWe, WWER-1000 type units. KAZMER consists of three subsystem, the KARD reactor noise diagnostic system, ARGUS vibration monitoring system for rotation machinery, and ALMOS acoustic monitoring system. The installation of the KAZMER system at the Kalinin Nuclear Power Station, Russia, and the first operational experiences are outlined. (R.P.) 15 refs.; 9 figs.

23430 (NUREG–1474) **Effect of Hurricane Andrew on the Turkey Point Nuclear Generating Station from August 20–30, 1992: [Final report].** Hebdon, F.J. (Institute of Nuclear Power Operations, Atlanta, GA (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data; Institute of Nuclear Power Operations, Atlanta, GA (United States). Mar 1993. 201p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

On August 24, 1992, Hurricane Andrew, a Category 4 hurricane, struck the Turkey Point Electrical Generating Station with sustained winds of 145 mph (233 km/h). This is the report of the team that the US Nuclear Regulatory Commission (NRC) and the Institute of Nuclear Power Operations (INPO) jointly sponsored (1) to review the damage that the hurricane caused the nuclear units and the utility's actions to prepare for the storm and recover from it, and (2) to compile lessons that might benefit other nuclear reactor facilities.

Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The High Temperature Engineering Testing Reactor (HTTR), currently under development by Japan Atomic Energy Research Institute (JAERI), uses fuel rods, which contain so called "fuel compact" of pellets and a form of fuel made by sintering coated UO_2 fuel kernel dispersed in natural graphite matrix in graphite sleeves. The spherical UO_2 fuel kernel in the fuel compact is covered with several layers of carbon and SiC. The primary objective of this study was to investigate the mechanical, fracture mechanics properties and the thermal shock resistances of the fuel compact. Disk or rod-shaped fuel compact specimens were prepared by using SiC-kernel coated particles instead of UO_2 particles, and by following otherwise the same manufacturing process as that for the real fuel compact. A series of experimental studies were then carried out by using these model specimens. These model specimens were further neutron irradiated in JMTR for fluences up to $1.7x10^{21}$ n/cm^2 (E<29fJ) at high temperature (900 deg. C ($\pm$ 50 deg. C)) to study the effects of neutron irradiation on the fracture mechanical properties. In this study, all the fratures were found to occur in the matrix or at the interfaces of kernel particles. No fracture of the SiC-kernel coated particles themselves was found. (author). 22 refs, 4 figs, 3 tabs, 5 photos.

23432 (IAEA-TECDOC–690, pp. 78-84) **A method for assessing the effects of graphite property variability on core structural integrity criteria.** Judge, R.C.B. (AEA Reactor Services, Risley (United Kingdom). Gas Cooled Reactor Assessments Dept.). International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The Reserve Strength Factor (RSF) is the factor of safety used in assessments of Advanced Gas-cooled Reactor core integrity. Values of RSF currently used are based on engineering judgement. These values should, in principle, be related to variability due to inhomogeneity of graphite, systematic error in the calculation route and uncertainties in property measurement. A probabilistic approach, bringing the safety assessment of the graphite core into line with other reactor components, is described in this paper. A probability distribution for the RSF may be obtained by repeatedly following the full calculation route. In each iteration, appropriate values for the key parameters will be obtained using the Latin Hypercube sampling technique. The number of key parameters will be kept to a minimum by first using the sensitivity calculations to eliminate the less important ones. Material properties have generally been obtained from tests on small specimens. The variability in these properties would, intuitively, be expected to be greater than that found in the brick (on which the RSF calculations are based). In the case of non-destructive properties these size effects may be treated by applying the central limit theorem. Core brick strength will be obtained from a series of on-going experiments. The statistical distribution of brick strength will be assumed to follow a Weibull function fitted to small specimen data. Work is currently underway, applying this proposed methodology to an Advanced Gas-cooled Reactor core. (author). 6 refs.

23433 (IAEA-TECDOC–690, pp. 87-95) **Bending fatigue behavior of nuclear-grade graphite under impact loading.** Futakawa, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Dept. of High Temperature Engineering); Kikuchi, K.; Muto, Y.; Shibata, H. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The graphite components in HTR (High Temperature gas-cooled Reactor) are subjected to impact force due to an earthquake. It is important from the viewpoint of seismic safety design to investigate the difference of strength under impact loading and non-impact loading. Both bending strength and bending fatigue strength tests, therefore, were carried out under impact non-impact loading on two kinds of graphite materials: isotropic and near-isotropic. The impact of response analyses, which used a beam model taking account of the contact behavior between specimen and tup, were performed to evaluate the relationships between impact energy, impact force and stress. The main conclusions obtained are summarized as follows: (1) A beam model taking account of the contact behavior through the Hertzian theory is applicable to describe the impact behavior. (2) The bending strength of graphite is independent of strain rate in the range from 10^{-6} to 5 l/s. (3) Despite both specimen volume and kind of graphite the strength of graphite is lower in impact fatigue than in non-impact fatigue. (author). 10 refs, 16 figs, 2 tabs.

23434 (IAEA-TECDOC–690, pp. 95-105) **Component test of the core support post of the HTTR.** Ishihara, M. (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Iyoku, T.; Takikawa, N.; Shiozawa, S.; Jinza, K.; Tsuji, N.; Miki, T. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The component test of core support post for the High Temperature Engineering Test Reactor (HTTR) was carried out to verify its structural integrity using full-scale and 1/2-scale models of core support post and seat. The compressive fracture load (buckling load) of support post was measured under the conditions of post inclination angles to the post axis up to about 1 degree, cyclic load above maximum applied load and oxidation weight loss under about 30% at room temperature. In the cyclic load test, compressive fracture load was also measured after 200 times of cyclic load applied; the magnitude of this cyclic load was about 2.5 times of the maximum applied load in the design of HTTR. In this report the effects of compressive fracture load on post inclination angle, cyclic load and oxidation weight loss of this component were discussed and obtained fracture loads were compared with the applied load in the design of HTTR. (author). 4 refs, 13 figs, 2 tabs.

23435 (IAEA-TECDOC–690, pp. 105-112) **Assessment of the load capacity of the dowel and socket system in the HTTR hexagonal block.** Takikawa, N. (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Ishihara, M.; Iyoku, T.; Shiozawa, S.; Tokumitsu, M.; Koe, S.; Uno, M. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The load capacity of the dowel and socket system was demonstrated in the seismic event using full size graphite blocks and finite element analysis. There was good agreement between the measured fracture stress and the calculated fracture stress. This shows the propriety of 3D FEM modeling in which analytical mesh, quoted data and boundary condition were involved. A special method was also developed for the dowel and socket system. It can estimate the stress of full 3D model from the stresses of 1/3 model. (author). 2 refs, 8 figs, 3 tabs.

23436 (IAEA-TECDOC–690, pp. 113-120) **The vibrational characteristics of the keyed graphite components in the HTTR.** Futakawa, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Iyoku, T.; Shiozawa, S.; Takada, S.; Shirai, H. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic

Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The assembly system consisting of the keyed graphite components, which is employed in the core bottom structure of the HTTR (High Temperature Engineering Test Reactor), has a nonlinear vibrational characteristic. The analytical code was developed to predict the vibrational characteristic, and the validity of the code was verified through seismic model tests. (author). 3 refs, 12 figs.

23437 (IAEA-TECDOC–690, pp. 195-199) **Engineering thermomechanics of nuclear graphites under neutron irradiation, oxidation and transient heatup: A review.** Arai, T. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Structural assessment of a GCR graphite component involves thermal and stress/strain calculations to determine local stress states. These analyses require data base and predictive models on thermomechanical behavior of graphite materials. The paper reviews state-of-the-art of graphite technology on thermomechanics with emphasis on nonisothermal irradiation, nonuniform oxidation and post-irradiation annealing. Relevant data base and predictive models are discussed. Nonisothermal irradiation behavior have now been handled partly by use of the Graphite Damage Model. Further verification of the methodology is being attempted. Some data base and analyses on deformation behavior of nonuniformly oxidized specimens are available. A few experimental evidences suggest that among various thermomechanical properties thermal conductivity should influence transient heatups after irradiations. Current knowledge and additional key data may be coordinated with a further sophistication of descriptive models for better performance and reliable operation of graphite components in actual reactors. (author). 30 refs, 1 fig., 4 tabs.

23438 (IAEA-TECDOC–690, pp. 200-204) **A review of irradiation creep in reactor graphite.** Kelly, B.T. (AEA Technology, Salwick (United Kingdom)). International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The construction of graphite moderated reactors with extended lives would be virtually impossible but for the existence of irradiation creep which relaxes stresses within components due to gradients of irradiation damage which would otherwise produce failure. A very large amount of experimental data exists on many types of graphite, but there are still important differences in the constitutive equations derived by different groups and applied to calculate brick stresses. This paper summarizes the results of a review of knowledge of irradiation creep recently carried out in the United Kingdom. (author). 8 refs, 3 figs, 1 tab.

23439 (IAEA-TECDOC–690, pp. 205-209) **Specific behavior of reflector and matrix graphite under high temperature irradiation.** Platonov, P.A. (I.V. Kurchatov Inst. of Atomic Energy, Moscow (Russian Federation). Dept. of Research Reactors and Technology); Karpukhin, V.I.; Shtrombakh, Ya.I.; Alekseev, V.M.; Chugunov, O.K.; Gurovich, B.A.; Trofimchuk, E.I. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Physical properties for reflector and matrix graphite for the VG-400 VGM reactors being developed in the USSR are reported. Three types of graphite have been investigated. These are: the graphite based on uncalcinated coke - KPG and MPC; the graphite based on the special coke - GR1; and the graphite for spherical fuel elements - molded graphite (KPD) and graphite binded by pyrocarbon (GSP). Specimens of these graphites have been irradiated up to a neutron fluence of 0.5 to 2.5×10^{22} neutron/cm^2. The dependence of the following on fluence is reported: relative volume change, Young's modulus, dimensional change, elastic modulus, electrical resistivity, thermal conductivity and the coefficient of thermal expansion. (author). 3 refs, 10 figs, 2 tabs.

23440 (IAEA-TECDOC–690, pp. 210-219) **Irradiation behavior of boronated graphite for the HTTR.** Matsuo, H. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kobayashi, F.; Sawa, K. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Two kinds of hot-pressed and cold-pressed boronated graphites containing 3 wt% or 30 wt% boron for use in the HTTR were studied. Neutron-irradiation was done up to a maximum fast neutron fluence 2×10^{25}n/m^2 (E>29fJ) at 550-1070 deg. C in the JMTR. Irradiation-induced dimensional changes, thermal expansivity and thermal conductivity from room temperature to high temperatures were measured after the irradiation. Dimensional changes and thermal expansivity depend on the direction measured and fabrication method, and thermal conductivity decreased and its temperature dependence changed after the irradiation. Furthermore the changes depend on boron content as well. (author). 7 refs, 12 figs, 1 tab.

The Strength Analysis Code for graphite components used in uranium-graphite channel-type reactors has been developed in the USSR on the basis of results of reactor graphite property investigations including its properties under neutron irradiation conditions as well as on the operating experience of graphite structural components in the uranium-graphite reactors. The graphite stack forms the basis for the uranium-graphite reactor design. The strength analysis of the graphite components are performed following the physics and thermal physics calculations needed to assess thermal and radiation stresses in the analyzed components as well as following the account of variations in physics and mechanical properties of graphite under neutron irradiation and temperature. Strength analysis principles in the code are based on limiting states determined for achievement of critical fluence, crack formation under static loading, accumulation of ultimate strain, and initiation of through crack under static and cyclic loading. Each of these is discussed in the paper. (author). 3 refs, 1 fig., 1 tab.

23442 (IAEA-TECDOC–690, pp. 265-272) **Radiolytic corrosion of graphite surveillance and lessons drawn from the operation of the BUGEY-1 reactor.** Petit, A. (Electricite de France (EDF), 01 - Loyettes (France). Centrale de Bugey); Phalippou, C.; Brie, M. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status*

of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991. [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

This document briefly describes some of the feedback of experience from operation of the BUGEY-1 reactor. There is a major radiolytic corrosion problem with the graphite of the stack of this reactor and small quantities of methane are added to the coolant gas to limit its effect. Inhibition with methane has the drawback of resulting in hydrocarbon deposits forming on the fuel elements, which makes it necessary to periodically eliminate them by injecting oxygen. The amount of weight loss is determined by annually taking core samples from the channel walls. Additional examinations are made, on completing each core drilling session, of the core samples with the highest corrosion factors: determination of the density profiles (and verification of weight loss) by gamma ray absorption; measurement of the compressive strength (perpendicularly to the channel wall); hydrogen analysis (on a few samples). Identical examinations are made on samples taken for the purpose parallel to the channel wall. 10 refs, 6 diagrams.

Graphite dimensional changes in N Reactor during its 24 yr operating history are reviewed. Test irradiation results, block measurements, stack profiles, top of reflector motion monitors, and visual observation of distortion are described. (author). 18 refs, 14 figs.

23444 (IAEA-TECDOC–690, pp. 281-288) **Non-destructive testing and acceptance test for HTTR graphite components.** Takikawa, N. (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Iyoku, T.; Shiozawa, S.; Ooka, N.; Kambe, M.; Ide, A. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The HTTR core is an array of hexagonal graphite blocks. It is supported by graphite core support structures and permanent side reflector blocks. The structural integrity of these graphite components is assured by the detail mechanical design and the acceptance test to guarantee the design. The acceptance test is planned for the graphite components as follows. (1) Material identification tests: To identify the graphite grade of received materials. (2) Impurity tests: To limit impurities to the level specified by the nuclear and shielding designs. (3) Strength tests: To guarantee the strength of received materials. (4) Non-destructive tests: To eliminate components with harmful flaws in them. To achieve the 4 objectives, ultrasonic and eddy current tests were selected for internal and surface flaw detection, respectively. Preliminary tests were carried out to obtain flaw detectability for the graphite grade used as a material of the HTTR components. (author). 3 figs, 7 tabs.

23445 (IAEA-TECDOC–690, pp. 291-298) **Non-destructive test of HTGR graphite components.** Ishihara, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Prototype NDT model units for HTTR graphite components was constructed and optimizing regulation tests of eddy-current Nondestructive Test (NDT) units and NDT for drill hole on the surface of plates made of IG-110 and PGX graphites were carried out. From those test results, the following conclusions were derived: (1) Recommendable probe-testing material distance (lift-off) and scanning speed for the evaluation of diameter of drill hole on the surface of graphite plates are within 0.1mm to 0.3mm and 25mm/s to 30mm/s respectively, however, for the evaluation of depth of drill hole, more than 30mm/s scanning speed should be chosen. (2) Measurable minimum diameter and maximum depth of drill hole measured by C-scan technique were 2mm and 3mm on the surface of IG-110 and PGX graphite plates. (author). 1 ref., 18 figs, 1 tab.

23446 (INIS-mf–13503, pp. 170-173) **ABB engagement in efforts to improve the safety of RBMK reactors.** Tiren, L.I. (ABB Atom AB, Vaesteraas (Sweden)); Bioere, S.; Molin, J. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

ABB Atom is engaged in safety analysis for the Ignalinsk (RBMK) nuclear power plant. The analysis is done within the framework of two different initiatives of the Swedish Nuclear Power Inspectorate, namely: probabilistic safety assessment, i.e. the BARSELINA project, and analysis of containment safety issues. The aim is to enable decisions to be made for specific hardware modifications. The following items were considered by the Swedish Nuclear Power Inspectorate to be the most significant with regard to safety and were thus selected for further study or action: nondestructive testing of primary system components, fire and flooding protection, pressure relief from the reactor cavity in certain accident sequences, Accident Localization System improvements, and a separate auxiliary feedwater system. (Z.S.) 1 fig.

(Brookhaven National Lab., Upton, NY (United States)); Kennett, R.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Brookhaven National Lab., Upton, NY (United States). May 1993. 37p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52356). Source: OSTI; NTIS; INIS; GPO.

This report documents several model extensions and improvements of the THATCH code, a code to model thermal and fluid flow transients in High Temperature Gas-Cooled Reactors. A heat exchanger model was added, which can be used to represent the steam generator of the main Heat Transport System or the auxiliary Shutdown Cooling System. This addition permits the modeling of forced flow cooldown transients with the THATCH code. An enhanced upper head model, considering the actual conical and spherical shape of the upper plenum and reactor upper head was added, permitting more accurate modeling of the heat transfer in thisregion. The revised models are described, and the changes and addition to the input records are documented.

Source: OSTI; NTIS (US Sales Only); GPO Dep.

The COMEDIE loop is an engineering-scale experimental loop that will be operated in the SILOE reactor pool at CENG to obtain an independent data base that can be used to validate MHTGR fission product transport codes. Testing will be done under representative MHTGR conditions with representative components.

Designed-to-fail (DTF) fuel particles, under irradiation, will release fission products that will be transported and distributed through the fuel block, a graphite block representing the lower reflector element, and a gas/gas heat exchanger representing the metallic surfaces in the primary circuit of an MHTGR. A depressurization section in the loop produces blowdowns simulating possible depressurization events. The primary purpose of this visit to the CENG was to review the technical and programmatic issues associated with French safety authorities' concerns about the COMEDIE loop that have caused several months' delay in starting the first irradiation test. A secondary purpose was to complete preparations for the start of this test, now expected to be in June or August 1992.

23450 (IAEA-TECDOC–690, pp. 169-176) **Corrosion behavior of sintered pellet of graphite and boron carbide in helium containing water vapor.** Fujii, K. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Dept. of Fuels and Materials Research); Nomura, S.; Shindo, M.; Imai, H. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The corrosion test of the sintered pellet of graphite and boron carbide, which has been adopted as a neutron absorber material in the control rod system, the reserved shutdown system, etc. of the High Temperature Engineering Test Reactor (HTTR), was carried out in helium containing water vapor at up to 1000 deg. C from a viewpoint of oxidation of boron carbide (B_4C). Moreover, from the results obtained of the corrosion test, the integrity of the reserved shutdown system was also evaluated. It is shown that the oxidation rates of the sintered pellet simply do not increase with temperature caused by the formation of B_2O_3. The oxidation reaction of the sintered pellet consists of three competing reactions: $B_4C+6H_2O=2B_2O_3+6H_2+C(F)$ first step; $C(F)+H_2O=CO+H_2$ and $C(G)+H_2O=CO+H_2$ second step. For the integrity of the reserved shutdown system, the mutual adhesion of the sintered pellets is one of the key factors because the sintered pellets mutually adhered may not be inserted into the core in an emergency. For the sintered pellet containing 30% B, which is the same B concentration as the specification of the sintered pellet adopted in the reserved shutdown system, mutual adhesion yields in such a case about 2% if the contained B is oxidized and the temperature exceeds 577 deg. C, which is the melting point of B_2O_3. There is no possibility of both conditions yielding in the HTTR, therefore it can be concluded that the integrity of the reserved shutdown system is not damaged against the corrosion. (author). 11 refs, 11 figs, 6 tabs.

23451 (INIS-mf–13503, pp. 100-103) **Experience of PSA based back-fitting.** Butcher, P. (AEA Technology, Winfrith (United Kingdom)); Debenham, A.A.; Holloway, N.J. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

AEA Technology has carried out a level 3 Probabilistic Safety Analysis (PSA) of the SGHWR reactor located at Winfrith. The PSA was used to identify the most effective potential back-fits for further improving the safety of the plant. Cost effectiveness was a significant factor in deciding the preferable options. A brief description of the reactor is given, and the accident sequences which dominate the risk from the plant are listed. The proposed hardware and procedural back-fits are discussed. Simple and cost effective hardware modifications, combined with improved accident management procedures, provided the greatest improvements in the assessed safety of the plant. (Z.S.) 4 figs.

23452 (KFKI–1992-19/G,I) **Acoustic emission experiments for PHWR technology development.** Pellionisz, P. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Jha, S.K.; Goswami, G.L. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Jun 1992. [21p.] Order Number DE93626294. Source: OSTI; NTIS (US Sales Only); INIS.

An Indian-Hungarian joint research project has been started with the aim of applying acoustic emission testing to solve specific problems of nuclear power plants. Acoustic emission measurement and analyzing instrumentation and software have been provided by the Hungarian side, while the measurements have been performed at the Bhabha Atomic Research Centre (BARC), India. The first task of the project was to check the capability of the method for leakage detection and shuttle movement monitoring of Pressurized Heavy Water Reactors (PHWR), and for monitoring manufacturing processes as laser welding. The preliminary measurements and results are presented. (R.P.) 15 refs.; 11 figs.; 3 tabs.

23453 (SAND–91-2383) **Scoping studies of boiling phenomena associated with the flooded cavity design of the Heavy Water New Production Reactor.** Chu, T.Y.; Dykhuizen, R.C.; Hickox, C.E. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (NPRW-SA–91-7). Order Number DE93013963. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The proposed Ebasco Heavy Water New Production Reactor (NPR-HWR) design incorporates a flooded reactor cavity as a design feature for accident mitigation. The downward heat transfer from the core-melt through the reactor vessel is expected to be balanced by boiling heat transfer outside of the bottom head thus preventing melt-through of the reactor vessel. The report presents results of scoping studies to examine the boiling phenomena associated with the flooded cavity design. Relevant literature of boiling from downward-facing surfaces is reviewed and the scaling parameters of the problem are examined. In addition, approximate analyses are performed to obtain a quantitative appreciation of the problem and help to determine correlation groups with which to examine future experimental data.

23454 (WSRC-TR–92-357) **Type Q septifoil guide tube freeboard: Model description and results: Task Number: 92-057-1.** Shadday, M.A. (ed.). Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1992. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014721. Source: OSTI; NTIS; GPO Dep.

On May 25, 1992, a moderator leak was detected as partial length control rods in K Reactor were being positioned for reactor start up. The source of the leak was suspected to be overflow of the control rod guide tubes that are above the septifoils, though the cause was unknown. The control rods were re-inserted, and the process water pump AC drive motors were tripped. K Reactor start up was put on hold until the cause of the leak was understood, and rectified. Tests to determine the cause of the leak were initiated by the Heat Transfer Laboratory (HTL) that evening. On May 27, the cause of the overflow was identified from HTL tests. The overflow was caused by flow through the partial control rod extension tubes up into their guide tubes. When the top ends of the

partial length control rod extension tubes are drawn up into the guide tubes, the guide tubes are pressurized by the flow diverted through the extension tubes, and the freeboard in those guide tubes is reduced. This secondary flow path was not anticipated when the type Q septifoil was designed, and it was therefore not included in existing septifoil models. This report documents the development of a septifoil model that includes the various secondary flow paths, and predicts the freeboards in the guide tubes, as functions of the control rod positions, the blanket gas pressure, and the septifoil flow rate. The results of this model agree very well with HTL test results, and therefore reinforce confidence in the management decision to throttle septifoil flow to approximately 70 gpm, to prevent overflow of the septifoil guide tubes.

23455 (WSRC-TR–93-080) **Final report for the flow excursion follow-on testing.** Nash, C.A.; Walters, T.W. Westinghouse Savannah River Co., Aiken, SC (United States). 5 Aug 1992. 244p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013570. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Mark 22 Flow Excursion Follow-On testing was to investigate the theory that approximately 15% of the flow bypassed the primary flow channels in previous testing, whereas the design called for only a 3% bypass. The results of the follow-on tests clearly confirmed this theory. The testing was performed in two phases. During the first phase, characterization tests performed during the earlier test program were repeated.

Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930352–15: 2. international conference on nuclear engineering, San Francisco, CA (United States), 21-24 Mar 1993). Order Number DE93009131. Source: OSTI; NTIS; INIS; GPO Dep.

An analytical model was developed which predicts that the leak rate (or drip rate) of molten plutonium onto a substrate must be low in order for plutonium to solidify into a problematical hemispherical shape. The heat transfer to the substrate is the significant factor in how quickly the fuel solidifies. Analysis and experiment show that for a given substrate, the deposit center height is independent of the leakrate. A good conductor, such as copper on the bottom of a fuel casting furnace, will conduct heat away quickly and tend to cause the fuel to form into a hemisphere. A good insulator on the other hand, will keepthe metal molten to allow it to spreads out and solidify as a flat disk. Higher substrate temperatures inhibit the undesirable hemispherical shape. Experiments conducted were in good agreement with the an analytical model.

23457 (ANL/OTD-ER/CP–79006) **Progress and status of the Integral Fast Reactor (IFR) fuel cycle development.** Till, C.E.; Chang, Y.I. Argonne National Lab., IL (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930433–6: 55. annual American power conference, Chicago, IL (United States), 13-15 Apr 1993). Order Number DE93009967. Source: OSTI; NTIS; INIS; GPO Dep.

The Integral Fast Reactor (IFR) fuel cycle holds promise for substantial improvements in economics, diversion-resistance, and waste management. This paper discusses technical features of the IFR fuel cycle, its technical progress, the development status, and the future plans and directions.

23458 (CEA-CONF–11279) **Tripoli 3: a Monte Carlo code with a powerful and automatic biasing.** Vergnaud, T.; Nimal, J.C.; Both, J.P. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1993. [10p.] (CONF-930404–: International topical meeting on mathematical methods and supercomputing in nuclear applications (M&C+SNA '93), Karlsruhe (Germany), 19-23 Apr 1993). Order Number DE93626295. Source: OSTI; NTIS (US Sales Only); INIS.

The TRIPOLI-3 program kept all the capabilities of the TRIPOLI-2 but offers many other possibilities. The most interesting is the automatization of the biasing which makes easier the user's work significantly. The visualization of the spatial and energetic distribution of particles during the simulation allows to check the biasing.

23459 (FEI–2140) **Temperature fields and coefficient of sodium turbulent temperature conductivity at fast reactor fuel assembly model outlet.** Zhukov, A.V.; Matyukhin, N.M.; Yur'ev, Yu.S.; Sanina, I.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1990. [10p.] (In Russian). Order Number DE93626296. Source: OSTI; NTIS (US Sales Only); INIS.

Temperature distributions by radius and height of the overassembly space were determined in experiments carried out with seven model subassemblies with external subassembly heating in the case of sodium flow rate variation. The essential equalization of temperature non-uniformity through the flow has been exposed. Exponential approximation of temperature distribution in axial direction as well as Bessel function approximation in radial direction enable to define the mean turbulent temperature diffusivity and its dependence on the Peclet number. 10 refs.; 8 figs.

23460 (FEI–2151) **On studying the reactor fuel element local temperatures under nonstationary conditions.** Mikhin, V.I.; Matyukhin, N.M.; Zhukov, A.V.; Fetisova, L.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1990. [19p.] (In Russian). Order Number DE93627421. Source: OSTI; NTIS (US Sales Only); INIS.

The results of numerical theoretical analysis of the possibility of modelling of the nonstationary temperature regimes in fast reactor fuel assemblies are presented. The conditions of approximate modelling of nonstationary heat transfer in fast reactor fuel assemblies are also presented. The investigation has been successful in rendering a number of typical nonstationary processes and in obtaining the data for the subsequent improvement of the method of temperature regime modelling in fast reactor fuel assemblies. 3 refs.; 15 figs. <GS>

23461 (JAERI-M–92-196) **Benchmark physics experiment of metallic-fueled LMFBR at FCA: Core design of FCA assembly XVI-1 and criticality.** Iijima, Susumu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Oigawa, Hiroyuki; Nakano, Masafumi; Bando, Masaru. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1992. 38p. (In Japanese). Order Number DE93797512. Source: OSTI; NTIS; INIS.

A benchmark physics experiment of a metallic-fueled LMFBR was performed at Japan Atomic Energy Research Institute's Fast Critical Assembly (FCA) in order to examine availability of data and method for a design of metallic-fueled core. The nuclear data and the calculation methods used for a LMFBR core design have been improved based on the oxide fuel core experiments. A metallic-fueled core has a harder neutron spectrum than an oxide-fueled core and has typical nuclear characteristics affected by the neutron spectrum. In this study, availability of the conventional calculation method for the design of the metallic-fueled core was examined by comparing the calculation values of the nuclear characteristics with the measured values. The experimental core (FCA assembly XVI-1) was selected by referring to the conceptual design of Central Research Institute of Electric Power Industry. The calculated-to-experiment (C/E) value for k_{eff} of assembly XVI-1 was 1.001. From this, as far as the criticality the prediction accuracy of the conventional calculation for the metallic-fueled core was concluded to be similar to that of an oxide-fueled core. (author).

23462 (NIIAR–13-796) **Study on the influence of phase characteristics of the amplifier track on the errors for sodium flow rate measurements by correlation method.** Tokarev, A.Yu. Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation). 1990. [12p.] (In Russian). Order Number DE93626297. Source: OSTI; NTIS (US Sales Only); INIS.

Methods for calculation of an error in determining the cross-correlation function peak position depending on the relative change of the nominal values of the amplifier track descrete components for sodium flow rate measurements by method are described. The

results of calculation experiments and relations obtained for low-frequency Chebyshev filters of the second order of magnitude in case of non-identity of the capacities in the feedback curcuit of the operational amplifiers, forming these filters are presented. 4 refs.; 5 figs.

23463 (WHC-SA–1602) **Status of fuel, blanket, and absorber testing in the Fast Flux Test Facility.** Baker, R.B.; Bard, F.E.; Leggett, R.D.; Pitner, A.L. Westinghouse Hanford Co., Richland, WA (United States). Nov 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-921102–61: Joint American Nuclear Society (ANS)/European Nuclear Society (ENS) international meeting on fifty years of controlled nuclear chain reaction: past, present, and future, Chicago, IL (United States), 15-20 Nov 1992). Order Number DE93014187. Source: OSTI; NTIS; INIS; GPO Dep.

Over 67,000 fuel, blanket and absorber pins have been irradiated in the Fast Flux Test Facility (FFTF) during its first 12 years of operation. Tests are run in highly controlled and monitored environments with core components similar in size to those in commercial liquid metal reactor (LMR) designs. While primary emphasis was placed on mixed oxide fuels, significant development programs have included metallic fuels, UO_2 blankets, B_4C absorbers, and other fuels and materials of interest. Irradiation programs for mixed oxides have included progressively lower swelling cladding and duct alloys (e.g., 316 SS, D9 SS, and the ferritic HT9), which also have application to other core components. In many instances the current exposure levels of the advanced FFTF tests are the highest attained and reported in the literature. This paper summarizes the status of irradiation experience at the facility, presents some general conclusions, and reviews the potential for obtaining additional significant data.

23464 (WHC-SA–1682) **Transport of radioactive material in liquid sodium.** Brehm, W.F. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930376–1: International seminar on liquid metal systems: material behavior and physical chemistry in liquid metal systems II, Karlsruhe (Germany), 16-18 Mar 1993). Order Number DE93011355. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the development of measurement and control techniques for radioactive materials in liquid sodium systems, as applied to the Fast Flux Test Facility (FFTF). The FFTF is a three-loop, sodium cooled fast reactor located on the US Department of Energy (USDOE) Hanford Site in Washington state. It achieved criticality in 1980, operated at its full rated power of 400 MWt until 1986, operated at 291MWt from 1986 until 1992, and is now (March 1993) in standby condition. Three primary loops transfer heat from the core to intermediate heat exchangers (IHX), which in turn transfer the heat to the secondary sodium system. The secondary system consists of three independent loops, each connected to an air-dump heat exchanger. Sodium purification is achieved by one cold trap on the primary system and one cold trap on each of the secondary loops. The cold traps are normally on line, but have been taken off line on occasion for repairs. A trap to remove radioactive cesium from primary sodium has been operated since 1987.

23465 (WSRC-TR–91-481) **User's manual for GILDA: An infinite lattice diffusion theory calculation.** Le, T.T. Westinghouse Savannah River Co., Aiken, SC (United States). Nov 1991. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014754. Source: OSTI; NTIS; GPO Dep.

GILDA is a static two-dimensional diffusion theory code that performs either buckling (B^2) or k-effective (k_{eff}) calculations for an infinite hexagonal lattice which is constructed by repeating identical seven-cell zones (one cell is one or seven identical homogenized hexes). GILDA was written by J. W. Stewart in 1973. This user's manual is intended to provide all of the information necessary to set up and execute a GILDA calculation and to interpret the output results. It is assumed that the user is familiar with the computer (VAX/VMS or IBM/MVS) and the JOSHUA system database on which the code is implemented. Users who are not familiar with the JOSHUA database are advised to consult additional references to understand the structure of JOSHUA records and data sets before turning to section 4 of this manual. Sections 2 and 3 of this manual serve as a theory document in which the basic diffusion theory and the numerical approximations behind the code are described. Section 4 describes the functions of the program's subroutines. Section 5 describes the input data and tutors the user how to set up a problem. Section 6 describes the output results and the error messages which may be encountered during execution. Users who only wish to learn how to run the code without understanding the theory can start from section 4 and use sections 2 and 3 as references. Finally, the VAX/VMS and the IBM execution command files together with sample input records are provided in the appendices at the end of this manual.

23466 (WSRC-TR–93-085) **FLOWTRAN-TF user guide.** Flach, G.P.; Lee, S.Y.; Aleman, S.E. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014743. Source: OSTI; NTIS; GPO Dep.

This document is a set of detailed instructions and guidelines to aid users in constructing and interpreting FLOWTRAN-TF input and output files for version 1.2 of the source code. The document assumes the user is familiar with the FLOWTRAN-TF Software Design report, SRS fuel assembly hardware, and two-phase flow. General code capabilities and input options are summarized. Then, detailed instructions for creating and interpreting code input files are given next. A sample input deck and corresponding output files are listed for reference and illustration. FLOWTRAN-TF is a two-phase thermal-hydraulics code of similar technology to existing commercial reactor codes such as RELAP and TRAC but customized for Savannah River Site applications. The code may be used to simulate solid components, fluid coolant flow and solid-fluid heat transfer, or fluid flow only (adiabatic flow channels). Pure component water or two-component air-water flows may be modeled. A variety of materials may be chosen for the solid tubes separating flow channels. FLOWTRAN-TF is fundamentally a transient analysis tool.

Member of Industry-Lab-Government delegation invited to visit the Commonwealth of Independent States (CIS) to attend Nuclear Rocket Engines Conference in Semipalatinsk-21, Kazakhstan; visit a number of nuclear facilities; participate in technical discussions at several Russian organizations involved with space nuclear technology; discuss possibilities of Sandia participation in US/CIS programs. Significant programs exist in the CIS in these areas, but appear to have slowed due to funding difficulties and national priorities. The CIS possesses valuable technologies of significant relevance to current US interests and programs which they seem willing to make available to the US as relations between the US and the CIS improve.

23468 (EGG-M–92413) **A modular gas-cooled cermet reactor system for planetary base power.** Jahshan, S.N.; Borkowski, J.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). 16 Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930103–33: 10. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 10-14 Jan 1993). Order Number DE93013672. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Fission nuclear power is foreseen as the source for electricity in planetary colonization and exploration. This report discusses a six module gas-cooled, cermet-fueled reactor which is proposed to meet the design objectives. The highly enriched core is compact

and can operate at high temperature for a long life. The helium coolant powers six modular Brayton cycles that compare favorably with the SP- 100-based Brayton cycle.

23469 (EGG-M–92502) **Nuclear propulsion systems engineering.** Madsen, W.W.; Neuman, J.E.: Van Haaften, D.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-920803–17: Nuclear technologies for space exploration, Jackson, WY (United States), 16-19 Aug 1992). Order Number DE93010791. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Energy for Rocket Vehicle Application (NERVA) program of the 1960's and early 1970's was dramatically successful, with no major failures during the entire testing program. This success was due in large part to the successful development of a systems engineering process. Systems engineering, properly implemented, involves all aspects of the system design and operation, and leads to optimization of theentire system: cost, schedule, performance, safety, reliability, function, requirements, etc. The process must be incorporated from the very first and continued to project completion. This paper will discuss major aspects of the NERVA systems engineering effort, and consider the implications for current nuclear propulsion efforts.

23470 (EGG-NE–10391) **Gas core nuclear thermal rocket engine research and development in the former USSR.** Koehlinger, M.W.; Bennett, R.G.; Motloch, C.G. (eds.); Gurfink, M.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1992. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012165. Source: OSTI; NTIS; INIS; GPO Dep.

Beginning in 1957 and continuing into the mid 1970s, the USSR conducted an extensive investigation into the use of both solid and gas core nuclear thermal rocket engines for space missions. During this time the scientific and engineering. problems associated with the development of a solid core engine were resolved. At the same time research was undertaken on a gas core engine, and some of the basic engineering problems associated with the concept were investigated. At the conclusion of the program, the basic principles of the solid core concept were established. However, a prototype solid core engine was not built because no established mission required such an engine. For the gas core concept, some of the basic physical processes involved were studied both theoretically and experimentally. However, no simple method of conducting proof-of-principle tests in a neutron flux was devised. This report focuses primarily on the development of the. gas core concept in the former USSR. A variety of gas core engine system parameters and designs are presented, along with a summary discussion of the basic physical principles and limitations involved in their design. The parallel development of the solid core concept is briefly described to provide an overall perspective of the magnitude of the nuclear thermal propulsion program and a technical comparison with the gas core concept.

23471 (WINCO–11917) **Opacities of uranium-hydrogen gas mixtures at high temperatures and pressures.** Tanner, J.E. (EG and G Idaho, Inc., Idaho Falls, ID (United States)). Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93014879. Source: OSTI; NTIS; INIS; GPO Dep.

Opacities of mixtures of hydrogen and uranium gases are needed for model calculations presently underway, on gas-core nuclear propulsion engines. Opacities over a range of temperatures, pressures, and wavelengths are available for uranium and hydrogen individually. Opacities for mixtures of hydrogen and uranium in various proportions, totaling 1.013×10^8 NM^{-2} (1000atm) are presented here.

23472 (WSRC-RP–92-910) **Summary of the SRS Severe Accident Analysis Program, 1987–1992.** Long, T.A.; Hyder, M.L.; Britt, T.E.; Allison, D.K.; Chow, S.; Graves, R.D.; DeWald, A.B. Jr.; Monson, P.R. Jr.; Wooten, L.A. Westinghouse Savannah River Co., Aiken, SC (United States). Nov 1992. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013690. Source: OSTI; NTIS; INIS; GPO Dep.

The Severe Accident Analysis Program (SAAP) is a program of experimental and analytical studies aimed at characterizing severe accidents that might occur in the Savannah River Site Production Reactors. The goals of the Severe Accident Analysis Program are: To develop an understanding of severe accidents in SRS reactors that is adequate to support safety documentation for these reactors, including the Safety Analysis Report (SAR), the Probabilistic Risk Assessment (PRA), and other studies evaluating the safety of reactor operation; To provide tools and bases for the evaluation of existing or proposed safety related equipment in the SRS reactors; To provide bases for the development of accident management procedures for the SRS reactors; To develop and maintain on the site a sufficient body of knowledge, including documents, computer codes, and cognizant engineers and scientists, that can be used to authoritatively resolve questions or issues related to reactor accidents. The Severe Accident Analysis Program was instituted in 1987 and has already produced a substantial amount of information, and specialized calculational tools. Products of the Severe Accident Analysis Program (listed in Section 9 of this report) have been used in the development of the Safety Analysis Report (SAR) and the Probabilistic Risk Assessment (PRA), and in the development of technical specifications for the SRS reactors. A staff of about seven people is currently involved directly in the program and in providing input on severe accidents to other SRS activities.

The Title List of Documents Made Publicly Available is a monthly publication. It contains descriptions of the information received and generated by the US Nuclear Regulatory Commission (NRC). This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials and (2) nondocketed material received and generated by NRC pertinent to its role as a regulatory agency. As used here, docketed does not

refer to Court dockets; it refers to the system by which NRC maintains its regulatory records. This series of documents is indexed by a Personal Author Index, a Corporate Source Index, and a Report Number Index. The docketed information contained in the Title List includes the information formerly issued through the Department of Energy publication Power Reactor Docket Information, last published in January 1979. NRC documents that are publicly available may be examined without charge at the NRC Public Document Room (PDR). Duplicate copies may be obtained for a fee. Standing orders for certain categories of documents are also available. Clients may search for and order desired titles through the PDR computerized Bibliographic Retrieval System, which is accessible both at the PDR and remotely. The PDR is staffed by professional technical librarians, who provide reference assistance to users. See NOTES at the end of the preface for information about reaching the PDR. Microfiche of the docketed information listed in the Title List is available for sale on a subscription basis from the National Technical Information Service (NTIS). See NOTES at the end of the Preface for the complete NTIS address. We encourage your comments, criticisms, and suggestions. In particular, if there are title descriptions that are not meaningful, please let us know so that we can correct the data base. Insofar as possible, we would like this document to be a valuable part of your reference material.

23476 (NUREG–0750-Vol.36-Index1) **Indexes to Nuclear Regulatory Commission issuances, July–September 1992: Volume 36, Index 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Apr 1993. 47p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Digests and indexes for issuances of the Commission (CLI), the Atomic Safety and Licensing Board Panel (LBP), the Administrative Law Judges (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM) are presented in this document. These digests and indexes are intended to serve as a guide to the issuances. These information elements are displayed in one or more of five separate formats arranged as follows: 1. Case Name Index: The case name index is an alphabetical arrangement of the case names of the issuances. Each case name is followed by the type of hearing, the type of issuance, docket number, issuance number, and full text reference. 2. Digests and Headers: The headers and digests are presented in issuance number order as follows: the Commission (CLI), the Atomic Safety and Licensing Board Panel (LBP), the Administrative Law Judge (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM). The header identifies the issuance by issuance number, case name, facility name, docket number, type of hearing, date of issuance, and type of issuance. 3. Legal Citations Index: This index is divided into four parts and consists of alphabetical or alpha-numerical arrangements of Cases, Regulations, Statutes, and Others. These citations are listed as given in the issuances. Changes in regulations and statutes may have occurred to cause changes in the number or name and/or applicability of the citation. It is therefore important to consider the date of the issuance. 4. Subject Index: Subject words and/or phrases, arranged alphabetically, indicate the issues and subjects covered in the issuances. 5. Facility Index: The index consists of an alphabetical arrangement of facility names from the issuance. The name is followed by docket number, type of hearing, data, type of issuance, issuance number, and full text reference.

23477 (NUREG–0750-Vol.36-No.6) **Nuclear Regulatory Commission issuances, December 1992: Volume 36, No. 6.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. [1992]. 49p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judges (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

23478 (NUREG–0936-Vol.12-No.1) **NRC regulatory agenda: Quarterly report, January–March 1993: Volume 12, No. 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Apr 1993. 118p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

The NRC Regulatory Agenda is a compilation of all rules on which the NRC has recently completed action, or has proposed action, or is considering action, and all petitions for rulemaking which have been received by the Commission and are pending disposition by the Commission. The Regulatory Agenda is updated and issued each quarter.

23479 (NUREG–0940-Vol.11-No.4) **Enforcement actions: Significant actions resolved: Quarterly progress report, October–December 1992: Volume 11, No. 4.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement. Mar 1993. 317p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This compilation summarizes significant enforcement actions that have been resolved during one quarterly period (October–December 1992) and includes copies of letters, Notices, and Orders sent by the Nuclear Regulatory Commission to licensees with respect to these enforcement actions. It is anticipated that the information in this publication will be widely disseminated to managers and employees engaged in activities licensed by the NRC, so that actions can be taken to improve safety by avoiding future violations similar to those described in this publication.

23481 (CEA-CONF–11276) **An anisotropic scattering treatment for the even parity transport equation.** Akherraz, B.; Fedon-Magnaud, C.; Lautard, J.J. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1993. [9p.] (CONF-930404–: International topical meeting on mathematical methods and supercomputing in nuclear applications (M&C+SNA '93), Karlsruhe (Germany), 19-23 Apr 1993). Order Number DE93626210. Source: OSTI; NTIS (US Sales Only); INIS.

This work introduces an extension of the even-odd parity flux formulation to the treatment of anisotropic scattering with the finite element formulation. To keep a similar form to the even parity transport equation in the isotropic case, we define a 'direction-dependent cross section'. We have only two unknown functions (the even parity flux, and the direction dependent cross section),

that are calculated via an iterative process. We consider the multigroup equation for the eigenvalue problem and we present some numerical tests to prove the effectiveness of this method.

23482 (CEA-CONF–11277) **Importance function by collision probabilities for Monte Carlo code Tripoli.** Morillon, B.; Both, J.P.; Nimal, J.C. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1993. [11p.] (CONF-930404–: International topical meeting on mathematical methods and supercomputing in nuclear applications (M&C+SNA '93), Karlsruhe (Germany), 19-23 Apr 1993). Order Number DE93626211. Source: OSTI; NTIS (US Sales Only); INIS.

We present a completely automatic biasing technique where the parameters of the biased simulation are deduced from the solution of the adjoint transport equation calculated by collision probabilities. In this study we shall estimate the importance function through collision probabilities method and we shall evaluate its possibilities thanks to a Monte Carlo calculation. We have run simulations with this new biasing method for one-group transport problems with isotropic shocks (one dimension geometry and X-Y geometry) and for multigroup problems with anisotropic shocks (one dimension geometry). For the anisotropic problems we solve the adjoint equation with anisotropic collision probabilities. The results show that for the one-group and homogeneous geometry transport problems the method is quite optimal without Splitting and Russian Roulette technique but for the multigroup and heterogeneous X-Y geometry ones the figures of merit are higher if we add Splitting and Russian Roulette technique.

23483 (FEI–2184) **Effect of the reactor heterogeneous structure on K_∞ value determined by the reactivity method.** Dulin, V.A.; Mikhajlov, G.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1991. [13p.] (In Russian). Order Number DE93626212. Source: OSTI; NTIS (US Sales Only); INIS.

The paper deals with the calculation of the multiplication medium heterogeneous structure influence on K^+ value (closed to the K_∞ value) derived from cell reactivity measurement. It is shown that heterogeneous structure requires for making the spectral calculations differing from traditional ones. Comparative analysis of heterogeneity corrections in K^+ value on the basis of the calculations by different codes have been performed. The calculation results are compared with experimental ones. 7 refs.; 3 tabs.

23484 (JAERI-M–93-040) **Design of H_∞ optimal estimator for linear time-invariant system: State space design approach and its application to reactivity estimation.** Suzuki, Katsuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Shimazaki, Junya; Shinohara, Yoshikuni. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 31p. (In Japanese). Order Number DE93797603. Source: OSTI; NTIS; INIS.

H_∞ optimal estimation theory is formulated as a minimax problem where the maximum 'energy' of estimation error over all disturbance trajectories in L_2 functional space is minimized in the sense of H_∞-norm. A design method based on the characteristics of the formulation is presented in which design specifications can be taken into account as frequency weights for the objective function. We applied this method to design a reactivity estimator for a fast breeder reactor. In the design was used a system model which consists of usual reactor point kinetics equations combined with a state equation of net reactivity driven by fictitious noise/disturbance. Finally, we show by computer simulation that H_∞ estimator gives good results in estimating net reactivity changes caused by various disturbances. (author).

23485 (KFKI–1992-18/G) **On the eigenfrequencies of fuel rod vibration in NPPs.** Lipcsei, S. (Atomic Energy Research Inst., Budapest (Hungary). Dept. of Applied Reactor Physics); Kiss, S.; Por, G. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. May 1992. [19p.] Order Number DE93626213. Source: OSTI; NTIS (US Sales Only); INIS.

In neutron fluctuation spectra measured in nuclear reactors, in-core vibrations appear generally as separate frequency peaks. Therefore, neutron fluctuation spectra can be used to analyze these vibrations and to obtain information for diagnostic purposes. Eigenfrequencies of fuel pins were calculated using fourth-order differential equation for vibration. Theoretical results were verified experimentally. It was shown that the series of eigenfrequencies follow a quadratic trend, and in the dependence of eigenfrequencies on constraints the low-order modes are largely influenced. Experimental and calculated results agree fairly well. (R.P.) 13 refs.; 10 figs.; 3 tabs.

23486 (LIYaF–1612) **Account for temperature distribution heterogenelty in research reactor kinetics calculations: KINO program.** Dik, G.R.; Shustov, V.A. AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki. Jun 1990. [30p.] (In Russian). Order Number DE93626214. Source: OSTI; NTIS (US Sales Only); INIS.

A calculation model for a research reactor kinetics with reactivity feedback is investigated. The neutron kinetics equation (reactor power and delayed neutron precursor) are taken in one point approximation. The heat kinetics equation for time dependent full and water temperature distribution are solved for each subregion (node), into which the core is divided. Using the first order perturbation theory the statistical weghts of separate nodes are determined. The model of the research reactor kinetics considered is realized in the KINO (KInetic NOdes) program. 14 refs.; 9 figs.; 1 tab.

23487 (NUREG/IA–0094) **Assessment of RELAP5/MOD3 against twenty-five post-dryout experiments performed at the Royal Institute of Technology.** Nilsson, L. (Swedish Nuclear Power Inspectorate, Stockholm (Sweden)). Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Swedish Nuclear Power Inspectorate, Stockholm (Sweden). May 1993. 89p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (STUDSVIK/NS–90/93). Source: OSTI; NTIS; INIS; GPO.

Assessment of RELAP5/MOD2 has been made against various experimental data, among others data from twenty-five post-dryout experiments conducted at the Royal Institute of Technology (RIT) in Stockholm. As the MOD3 version of RELAP5 has now been released, incorporating a different method of calculating critical heat flux compared to RELAP5/MOD2, it seemed justified to make another assessment against the same RIT-data. The results show that the axial dryout position is generally better predicted by the MOD3 than by the MOD2 version. The prediction is, however, still nonconservative, i.e. the calculated dryout position falls in most cases downstream the actual measured point. While the pre-dryout heat transfer seems to be equal for MOD2 and MOD3, both versions giving slightly higher wall temperatures than the experiments, there is a considerable difference in the post-dryout heat transfer. The results of the RIT data comparison indicate that MOD3 underpredicts the post-dryout wall temperatures remarkably while MOD2 gave reasonable agreement. In this respect RELAP5/MOD3 shows no improvement over RELAP5/MOD2.

23488 (WINCO–1110) **Validation of MCNP, a comparison with SCALE: Part 2, Highly enriched uranium metal systems.** Crawford, C.; Palmer, B.M. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Oct 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93012545. Source: OSTI; NTIS; INIS; GPO Dep.

This is Part 2 of a series of validation studies dealing with highly enriched uranium systems. For this study six sets of critical experiments involving uranium metal have been modeled and an effective multiplication factor, k_{eff}, calculated for each experiment. An earlier study[1] addresses the validation of MCNP for use with highly enriched uranium solutions. The calculations of k_{eff} were performed using MCNP 4. MCNP is a Monte Carlo based transport code which used continuous energy nuclear data for these calculations. END/B-V cross sections were used for this study- This report also compares the results of MCNP with the results of the CSAS25 module of SCALE 4 using the 27 group END/B-IV cross sections. Provided in Section 2 are general descriptions of the experiments performed. Section 3, Results, consists primarily of tables listing the calculated K_{eff}'s. Lastly, Sections 4 and 5 give a general discussion of observed trends in the results and suggested biases.

23489 (WINCO–1117) **Validation of the CSAS25 module of SCALE: Part 2, Highly enriched uranium metal systems.** Palmer, B.M.; Crawford, C. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Sep 1991. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93012543. Source: OSTI; NTIS; INIS; GPO Dep.

This is Part 2 of a series of validation studies dealing with highly enriched uranium systems. For this study six sets of critical experiments involving uranium metal have been modeled and an effective multiplication factor, k_{eff}, calculated for each experiment. The calculations of k_{eff} were performed using the CSAS25 module of SCALE 4. The CSAS25 module is made up of three distinct programs, BONAMI-II, NITAWL-II, and KENO Va. BONAMI-II and NITAWL-II are cross section manipulation routines capable of adjusting cross sections to take into account effects due to temperature, geometry, and composition. KENO Va is a monte carlo program that determines k_{eff} using the adjusted cross sections. Three cross section libraries available in SCALE were used for this study, the 16 group Hansen-Roach, the 27 group END/B-IV, and the 123 group Gam-Thermos. Provided in Section 2 are general descriptions of the experiments performed. Section 3, Results, consists primarily of tables listing the calculated k_{eff}'s. Lastly, Sections 4 and 5 give a general discussion of observed trends in the results and suggested biases.

23490 (WINCO–1118) **Validation of the CSAS25 module of SCALE: Part 3, Highly enriched uranium oxide systems.** Palmer, B.M.; Crawford, C. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Oct 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93014823. Source: OSTI; NTIS; INIS; GPO Dep.

This is Part 3 of a series of validation studies dealing with highly enriched uranium systems. For this study only one set of critical experiments involving uranium dioxide have been modeled. The calculations of k_{eff} were performed using the CSAS25 module of SCALE 4. The CSAS25 module is made up of three distinct programs, BONAMI-II, NITAWL-II, and KENO V.a. BONAMI-II and NITAWL-II are cross section manipulation routines capable of adjusting cross sections to take into account effects due to temperature, geometry, and composition. KENO V.a is a monte carlo program that determines k_{eff} using the adjusted cross sections. Three cross section libraries available in SCALE were used for this study, the 16 group Hansen-Roach, the 27 group ENDF/B-IV, and the 123 group Gam-Thermos. Part 1 includes descriptions of the cross sections and the cross section manipulation routines. What follows in Section 2 are general descriptions of the experiments performed. Section 3, Results, consists primarily of tables listing the calculated k_{eff}'s. Lastly, Sections 4 and 5 give a general discussion of observed trends in the results and suggested biases.

Source: OSTI; NTIS; INIS; GPO Dep.

The (SAG) Structural Aging Program has the objective of preparing documentation to help provide criteria for use by the USNRC in evaluating requests for continuing the service of NPPs. The program consists of three tasks: Materials property data base, structural component assessment/repair technologies, and quantitative methodology for continued service determinations. These tasks are detailed in this report.

23492 (CONF-930803–5) **A data base for aging of structural materials.** Oland, C.B. (Oak Ridge National Lab., TN (United States)); Naus, D.J.; Jerath, S. Oak Ridge National Lab., TN (United States). [1993]. 6p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology; Stuttgart (Germany); 16-20 Aug 1993. Order Number DE93009714. Source: OSTI; NTIS; INIS; GPO Dep.

USNRC initiated a Structural Aging (SAG) Program ORNL. The objective of the program is to provide assistance in identifying potential structural safety issues and to establish acceptance criteria for use in nuclear power plant evaluations for continued service. One main part focuses on the development of a Structural Materials Information Center where long-term and environment-dependent material properties are being collected and assembled into a data base. This data base is presented in two complementary formats. The Structural Materials Handbook is an expandable, hard-copy reference document that contains the complete data base for each material. The Structural Materials Electronic Data Base is accessible using an IBM-compatible personal computer. This paper presents an overview of the Structural Materials Information Center and briefly describes the features of the handbook and the electronic data base. In addition, a proposed method for using the data base to establish current property values for materials in existing concrete structures and to estimate the future performance of these materials is also presented.

23494 (EGG-M–92476) **The effects of load-sensitive behavior on the operability margins of motor-operated gate valves.** Steele, R. Jr.; Russell, M.J.; DeWall, K.G.; Watkins, J.C. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 11p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930803–11: 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology, Stuttgart (Germany), 16-20 Aug 1993). Order Number DE93013680. Source: OSTI; NTIS; INIS; GPO Dep.

Testing of motor-operated gate valves at various loads has produced a phenomenon we call load-sensitive behavior. This phenomenon has a significant effect on the accuracy of the methods used (and proposed) in the nuclear industry for determining that these valves can perform their design basis function. A valve subjected to tests with low flow and pressure loadings may achieve a stem thrust (at seating) analytically determined to be adequate for design basis flows and pressures, but this is no guarantee that the valve will achieve the same stem thrust when actually subjected to those design basis loads. This is because the friction at the interface between the stem and the stem nut is higher in tests with higher flow and pressure loadings, and this loss to friction is outside the control of the motor-operator's torque switch. This paper identifies a tentative method for determining, a stable, useful value for the stem/stem-nut coefficient of friction, one that can possibly be extrapolated and used in calculations to accurately estimate the design basis thrust requirements of these valves.

23495 (FEI–2166) **Two-fluid model for calculating the two-phase flow in reactor fuel assemblies: Equations, system of closure coefficients.** Bogoslovskaya, G.P.; Bogatyrev, I.L.; Zhukov, A.V.; Sorokin, A.P.; Titov, P.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1991. [38p.] (In Russian). Order Number DE93626215. Source: OSTI; NTIS (US Sales Only); INIS.

The full formation of two-fluid model of two-phase flow in reactor fuel subassembly, including 6 equations of mass, momentum and energy conservation, 3 interface equations and closure relations for different coolants in a wide range of the Prandtl numbers (water, liquid metal) is presented. As a result of analysis performed the correlations for interphase exchange by mass, momentum and heat, interphase area, slip ratio, friction and heat transfer are recomended. 26 refs.; 3 figs.; 6 tabs.

23496 (INIS-mf–13503, pp. 64-67) **Advanced repair methods for enhanced reactor safety.** Kornfeldt, H. (ABB Atom AB, Vaesteraas (Sweden)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). A few innovative concepts are described of the ABB Atom Service Division for repair and mitigation techniques for primary systems in nuclear power plants. The concepts are based on Shape Memory Alloy (SMA) technology. A basic feature of all methods is that welding and component replacement is being avoided and the radiation dose imposed on maintenance personnel reduced. The SMA-based repair methods give plant operators new ways to meet increased safety standards and rising maintenance costs. (Z.S.) 4 figs.

In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A method is described for the maintenance of equipment and components of a nuclear power plant. As a further development of currently applied maintenance strategies and plant specific requirements, a concept has been developed which enables classification into a logical and traceable arrangement. This classification system is based on the system design, construction characteristics and availability aspects. Systematically analyzing components from these aspects enables the preventive maintenance approach to be enhanced by the influence of the condition-based maintenance method. Using the results of operation data, an optimized maintenance programme can be developed that provides for safe operation, high availability and minimized maintenance costs. (Z.S.) 2 figs.

23499 (INIS-mf–13503, pp. 80-84) **Computerized management of plant intervention tasks.** Remacle, J. (Belgatom SA, Brussels (Belgium)); Quoidbach, G. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The concept of 'computerized management' of plant intervention tasks was developed by TRACTEBEL in 1983 for the Belgian power plants of ELECTRABEL. The main objective of the 'Computerized Management of Plant Intervention Tasks' is to help the staff of a nuclear or a conventional power plant in planning, organizing, and carrying out any (preventive or corrective) maintenance task. It consists of a group of interconnected functional modules acting on a unique and homogeneous data base. A short description of 3 modules is given, i.e., the 'User' Module, the 'Equipment' Module and the 'Periodic Procedure' Module. (Z.S.).

23500 (INIS-mf–13503, pp. 123-126) **Safety of existing installations under dynamic loads: observations on nonlinear response of piping systems - experiments, numerical analyses.** Habip, L.M. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The nonlinear response of piping systems under base excitation or due to pressure waves caused by simulated breaks and valve closure has been investigated experimentally at the HDR reactor. Structural analysis of ruptured piping and the related design of pipe whips restraints are usually performed on the basis of nonlinear material behavior, with powerful computational techniques being used increasingly. Some aspects of these developments (high-level earthquake tests, high-level pressure wave tests, pipe rupture nonlinear analyses) are summarized with implications for qualification and optimal backfitting of operating nuclear power plants. (Z.S.) 7 refs.

23501 (INIS-mf–13503, pp. 127-131) **Nuclear valves latest development.** Isaac, F. (Westinghouse Electric Corporation, Brussels (Belgium)); Monier, M. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

In the frame of Nuclear Power Plant upgrade (Emergency Power Supply and Emergency Core Cooling), Westinghouse had to face a new valve design philosophy specially for motor operated valves. The valves have to been designed to resist any operating conditions, postulated accident or loss of control. The requirements for motor operated valves are listed and the selected model and related upgrading explained. As part of plant upgrade and valves replacement, Westinghouse has sponsored alternative hardfacing research programme. Two types of materials have been investigated: nickel base alloys and iron base alloys. Programme requirements and test results are given. A new globe valve model (On-Off or regulating) is described developed by Alsthom Velan permitting the seat replacement in less than 10 min. (Z.S.) 2 figs.

23502 (INIS-mf–13503, pp. 207-210) **Valve monitoring ITI-MOVATS.** Moureau, S. (Westinghouse Energy Systems Inc., Brussels (Belgium)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). ITI-MOVATS provides a wide range of test devices to monitor the performance of valves: motor operated gate or globe valve, butterfly valve, air operated valve, and check valve. The ITI-MOVATS

testing equipment is used in the following three areas: actuator setup/baseline testing, periodic/post-maintenance testing, and differential pressure testing. The parameters typically measured with the MOVATS diagnostic system as well as the devices used to measure them are described. (Z.S.).

23503 (NUREG/CR–5957) **System 80+™ containment: Structural design review.** Greimann, L. (Ames Lab., IA (United States)); Fanous, F.; Challa, R.; Bluhm, D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Ames Lab., IA (United States). May 1993. 110p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-82. (IS–5083). Source: OSTI; NTIS; INIS; GPO.

A review of the structural design of the Combustion Engineering (CE) System 80+™ steel containment was completed. The stress analysis and the evaluation of the structure against buckling were performed by using BOSOR4 and BOSOR5 finite difference software, respectively. The CE System 80+™ containment was modelled as an axisymmetric shell consisting of different segments and mesh points with the additional mass of the penetrations and appurtenance being smeared around the circumference. The transition region was modelled using elastic springs with a foundation modulus of 180 lbs/in^3. The stresses due to the individual loads (dead loads, internal and external pressures and temperatures) were computed using the stress analysis option in the BOSOR4 program. The stresses from individual loads were combined according to ASME Code into stress intensities. Service Level B loadings produced a 20 percent over-stress in a small zone just above the transition region. All other stress intensities were within allowable limits. For the System 80+™, the perfect shell with an elastic material was initially analyzed. The calculated factor of safety values were 2.3 (Level B) and 1.59 (Levels C and D). Finally, sensitivity studies were conducted to investigate the effects of mesh size and transition zone stiffness on the controlling buckling load.

23504 (NUREG/CR–5972) **Effects of nonstandard heat treatment temperatures on tensile and Charpy impact properties of carbon-steel casting repair welds.** Nanstad, R.K. (Oak Ridge National Lab., TN (United States)); Goodwin, G.M.; Swindeman, M.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Oak Ridge National Lab., TN (United States). Apr 1993. 107p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/TM–12280). Source: OSTI; NTIS; INIS; GPO.

This report discusses carbon steel castings which are used for a number of different components in nuclear power plants, including valve bodies and bonnets. Components are often repaired by welding processes, and both welded components and the repair welds are subjected to a variety of postweld heat treatments (PWHT) with temperatures as high as 899°C (1650°F), well above the normal 593 to 677°C (1100 to 1250°F) temperature range. The temperatures noted are above the A1 transformation temperature for the materials used for these components. A test program was conducted to investigate the potential effects of such "nonstandard" PWHTs on mechanical properties of carbon steel casting welds. Four weldments were fabricated, two each with the shielded-metal-arc (SMA) and flux-cored-arc (FCA) processes,with a high-carbon and low-carbon filler metal in each case. All four welds were sectioned and given simulated PWHTs at temperatures from 621 to 899°C (1150 to 1650°F) in increments of 56°C (100°F) and for times of 5, 10, 20, and 40 h at each temperature. Hardness, tensile, and Charpy V-notch (CVN) impact tests were conducted for the as-welded and heat-treated conditions.

23505 (ORNL/FTR–4398) **Heavy-section steel technology program: Foreign trip report, July 4–October 1, 1992.** McCabe, D.E. Oak Ridge National Lab., TN (United States). 16 Oct 1992. 17p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009222. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of this travel was to spend a 3-month work period at GKSS-Forschungzentrum in Geesthact, Germany, to work on the development of an American Society for Testing and Materials (ASTM) standard practice for transition range testing of pressure vessel steels. A side trip was made to the Technical Research Centre of Finland (VTT) to meet with Dr. K. Wallin. As a result of this work experience, a GKSS report has been produced that covers background research performed, and a proposed test standard has been prepared. This standard will be made available to the Nuclear Regulatory Commission (NRC) in the form of a NUREG report.

23506 (SAND–92-1977) **Analysis guidelines for Deterministic Severe Accident Criteria compliance.** Griffith, R.O.; Williams, D.C.; Gido, R.G. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 175p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013710. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Deterministic Severe Accident Criteria (DSACs) were developed to help establish New Production Reactor containment design criteria that are based on the physical challenges that could potentially arise from a Severe Accident. The DSACs are composed of two parts: idealized problem statements that represent the physical challenges to the containment and success criteria for evaluating the containment's ability to accommodate these challenges. The values used to specify the physical challenges embody the uncertainty associated with Severe Accident phenomena, and the problem statements are structured to facilitate the designer's ability to demonstrate compliance with the design criteria. The development and establishment of the DSACs has been previously described. This document provides recommendations to the Department of Energy (DOE) regarding guidance that will enable designers to demonstrate compliance with the proposal DSACs. These guidelines are intended to provide guidance to the designer on acceptable design analyses so that the DOE will have a technically justifiable basis for their reviews of DSAC compliance well in advance of the actual design compliance process. This document emphasizes approaches to the calculation of Severe Accident loads and the resulting containment response. The analysis guidelines characterize an envelope of acceptable approaches and give specific criteria by which analysis methods not specifically described can be judged. A significant level of familiarity with Severe Accident phenomena was essential in the development of the analysis guidelines, primarily because, in some cases, the requirements of the highly complex phenomena were not obvious. However, it is important that the analysis guidelines be set by someone other than the designer, to avoid any appearance of conflict of interest.

23507 (SAND–92-2074C) **Analyses of separate effects tests for liner tearing in the 1:6 scale model of a reinforced concrete containment building.** Bergmann, V.L.; Weatherby, J.R.; Parks, M.B. Sandia National Labs., Albuquerque, NM (United States). [1993]. 7p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930803–9: 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology, Stuttgart (Germany), 16-20 Aug 1993). Order Number DE93009853. Source: OSTI; NTIS; INIS; GPO Dep.

In 1987, a 1:6 scale model of a reinforced concrete containment (RCA) building was tested at Sandia National Laboratories under the sponsorship of the US Nuclear Regulatory Commission (Herschel, 1988). Overpressurization of the scale model resulted in failure by liner tearing near an insert plate. The liner tear is believed to be a result of shear transfer from the concrete reinforcement to the liner through the studs (Weatherby, 1990). Separate effects tests were developed to further understand the mechanisms that led to the liner tearing in the 1:6 scale model. This paper describes finite element analyses used to predict the response and failure modes of the separate effects tests and presents comparisons of the finite element and experimental results.

23508 (UCRL-JC–110582) **Development and evaluation of a HEPA filter for increased strength and resistance to elevated temperature.** Gilbert, H. (Gilbert (Humphrey), McLean, VA (United States)); Bergman, W.; Fretthold, J.K. Lawrence Livermore National Lab., CA (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920823–9: 22. Department of Energy (DOE)/Nuclear Regulatory Commission (NRC) nuclear air cleaning and treatment conference, Denver, CO (United States), 24-27 Aug 1992). Order Number DE93009545. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed an improved HEPA filter for increased strength and resistance to elevated temperature to improve the reliability of HEPA filters under accident conditions. The improvements to the HEPA filter consist of a silicone rubber sealant and a new HEPA medium reinforced with a glass cloth. Several prototype filters were built and evaluated for temperature and pressure resistance and resistance to rough handling. The temperature resistance test consisted of exposing the HEPA filter to 1,000 scan at 700 degrees F for five minutes. The pressure resistance test consisted of exposing the HEPA filter to a differential pressure of 10 in. w.g. using a water saturated air flow at 95 degrees F. For the rough handling test, we used a vibrating machine designated the Q110. DOP filter efficiency tests were performed before and after each of the environmental tests. In addition to following the standard practice of using a separate new filter for each environmental test, we also subjected the same filter to the elevated temperature test followed by the pressure resistance test. The efficiency test results show that the improved HEPA filter is significantly better than the standard HEPA filter.

23509 (WSRC-MS–92-369) **Evaluation of stresses in large diameter, thin walled piping at support locations.** Bryan, B.J.; Flanders, H.E. Jr.; Rawls, G.B. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93011779. Source: OSTI; NTIS; INIS; GPO Dep.

The highest stresses in many thin walled piping systems are the local stresses at the pipe supports. These secondary stresses are caused by saddles or other structural discontinuities that restrain pipe ovalization. A static analysis of a thin walled pipe supported on structural steel saddle under dead weight loading is presented. The finite element analysis is performed using a shell model with distributed gravity and hydrostatic pressure loading. Parametric studies on global and local stress are performed to determine the effect of the pipe diameter to thickness ratio. Two aspects of the saddle design are also investigated: the effect of saddle width, and the effect of saddle wrap angle. Additionally, the computed stresses are compared to closed form solutions.

23510 (ANL/FC/CP–77769) **Automated Fuel Element Closure Welding System.** Wahlquist, D.R. Argonne National Lab., Idaho Falls, ID (United States). Fuel Cycle Div. [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930403–43: 5. topical meeting on robotics and remote systems, Knoxville, TN (United States), 26-29 Apr 1993). Order Number DE93009972. Source: OSTI; NTIS; INIS; GPO Dep.

The Automated Fuel Element Closure Welding System is a robotic device that will load and weld top end plugs onto nuclear fuel elements in a highly radioactive and inert gas environment. The system was developed at Argonne National Laboratory-West as part of the Fuel Cycle Demonstration. The welding system performs four main functions, it (1) injects a small amount of a xenon/krypton gas mixture into specific fuel elements, and (2) loads tiny end plugs into the tops of fuel element jackets, and (3) welds the end plugs to the element jackets, and (4) performs a dimensional inspection of the pre- and post-welded fuel elements. The system components are modular to facilitate remote replacement of failed parts. The entire system can be operated remotely in manual, semi-automatic, or fully automatic modes using a computer control system. The welding system is currently undergoing software testing and functional checkout.

23511 (FEI–2075) **Coefficients of heat transfer through fuel rods for the interchannel heat exchange in the nuclear reactor fuel assemblies.** Mikhin, V.I.; Fetisova, L.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1990. [28p.] (In Russian). Order Number DE93626230. Source: OSTI; NTIS (US Sales Only); INIS.

At an irregular rod surface temperature distribution transversal heat flows emerge between the subchannels of the rod bundle of a nuclear reactor because of the rod thermal conductivity. Under certain conditions the contribution of the rod thermal conductivity into heat exchange between subchannels can be dominant. The consistent approach is given for determination of this contribution which is accounted for by the heat transfer coefficients relating heat flows across the rod with subchannel average coolant temperatures. The formulae derived can be used in the rod bundle temperature-field calculations for nuclear reactors. 7 refs.; 5 figs.; 8 tabs.

23512 (FEI–2093) **Statistical modelling of fuel can geometrical characteristics in fuel assemblies of the BN type reactors.** Sopov, O.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1990. [12p.] (In Russian). Order Number DE93626231. Source: OSTI; NTIS (US Sales Only); INIS.

To study the regularities of the BN type reactor fuel can distortion a method of statistical modelling has been developed. At the stage of initial data analysis the correlation of within cluster mean and standard deviations has been reduced by dissection of fuel elements profilometry data matrix in terms of the can diameter value for a number of cross sections chosen after preliminary data interpolation. Making use of orthogonal Tchebychev polynomials for the dose - temperature distortion dependence to be described results in decreasing correlation of the model explaining variables. This allows the model parameters to be evaluated by the simple regression analysis methods and ensures the model invariance under a linear transformation of irradiation parameters. 9 refs.; 1 fig.; 1 tab.

23513 (NIIAR–14-797) **Technology of information processing on the complex of primary investigations of fuel assemblies and pins.** Andreev, V.E.; Demeshkin, V.A.; Mal'kov, P.A.; Shimanskij, G.A. Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation). 1990. [14p.] (In Russian). Order Number DE93626233. Source: OSTI; NTIS (US Sales Only); INIS.

The processing problems of non-destructive test results on irradiated fuel pins and assemblies are considered. Scheme of interaction between different levels of information processing system is described. The information was obtained on the complex of primary investigations. The data base structure development is presented for nondestructive test and application package of information in graphical representation. The problems of technology improvement when processing the results on material science experiment are discussed. 5 figs.

23514 (NIIAR–16-799) **Interface device of the IUS/IRPS interfaces for linking of the SM 1634 host computer system with the scales unit.** Zhmajlo, S.A.; Marusev, V.I. Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation). 1990. [12p.] (In Russian). Order Number DE93626410. Source: OSTI; NTIS (US Sales Only); INIS.

Problems of development of the interface device for the TUS/IRPS standard interfaces, which provides two-way information exchange with several users and its introduction into the operational environment of the host computer system of the SM-2 computer architecture are considered. Multiplexer application to the automated control system of the fuel pin production line is described. 5 refs.; 2 figs.; 1 tab.

23515 (WINCO–1112) **Validation of MCNP: SPERT-D and BORAX-V fuel.** Crawford, C.; Palmer, B. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Nov 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93012546. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses critical experiments involving SPERT-D^{1,2} fuel elements and BORAX-V$^{3-8}$ fuel which have been modeled and calculations performed with MCNP. MCNP is a Monte Carlo based transport code. For this study continuous-energy nuclear data from the ENDF/B-V cross section library was used. The SPERT-D experiments consisted of various arrays of fuel elements

moderated and reflected with either water or a uranyl nitrate solution. Some SPERT-D experiments used cadmium as a fixed neutron poison, while others were poisoned with various concentrations of boron in the moderating/reflecting solution. ne BORAX-V experiments were arrays of either boiling fuel rod assemblies or superheater assemblies, both types of arrays were moderated and reflected with water. In one boiling fuel experiment, two fuel rods were replaced with borated stainless steel poison rods.

Source: OSTI; NTIS; INIS; GPO Dep.

A method is described for optimizing the closed-loop plant control strategy with respect to safety margins sustained in the unprotected upset response of a liquid metal reactor. The optimization is performed subject to the normal requirements for reactor startup, load change and compensation for reactivity changes over the cycle. The method provides a formal approach to the process of exploiting the innate self-regulating property of a metal fueled reactor to make it less dependent on operator action and less vulnerable to automatic control system fault and/or operator error.

Source: OSTI; NTIS; INIS; GPO Dep.

Human factors reviews indicate that conventional alarm systems based on the one sensor, one alarm approach, have many human engineering deficiencies, a paramount example being too many alarms during major disturbances. As an effort to resolve these deficiencies, various alarm processing systems have been developed using different techniques. To ensure their contribution to operational safety, the impacts of those systems on operating crew performance should be carefully evaluated. This paper briefly reviews some of the human factors research issues associated with alarm processing techniques and then discusses a framework with which to classify the techniques. The dimensions of this framework can be used to explore the effects of alarm processing systems on human performance.

23518 (CONF-930433–8) **Backpropagation architecture optimization and an application in nuclear power plant diagnostics.** Basu, A.; Bartlett, E.B. This paper presents a Dynamic Node Architecture (DNA) scheme to optimize the architecture of backpropagation Artificial Neural Networks (ANNs). This network scheme is used to develop an ANN based diagnostic adviser capable of identifying the operating status of a nuclear power plant. Specifically, a "root" network is trained to diagnose if the plant is in a normal operating condition or not. In the event of an abnormal condition, and other "classifier" network is trained to recognize the particular transient taking place. these networks are trained using plant instrumentation data gathered during simulations of the various transients and normal operating conditions at the Iowa Electric Light and Power Company's Duane Arnold Energy Center (DAEC) operator training simulator.

This memorandum details meetings to develop a concept for automatic control of the 105 reactors.

23522 (EDF–93-NJ-00002) **Compiling models into real-time systems.** Dormoy, J.L.; Cherriaux, F.; Ancelin, J. Electricite de France (EDF), 92 - Clamart (France). Aug 1992. [13p.] Order Number DE93626238. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents an architecture for building real-time systems from models, and model-compiling techniques. This has been applied for building a real-time model-base monitoring system for nuclear plants, called KSE, which is currently being used in two plants in France. We describe how we used various artificial intelligence techniques for building it: a model-based approach, a logical model of its operation, a declarative implementation of these models, and original knowledge-compiling techniques for automatically generating the real-time expert system from those models. Some of those techniques have just been borrowed from the literature, but we had to modify or invent other techniques which simply did not exist. We also discuss two important problems, which are often underestimated in the artificial intelligence literature: size, and errors. Our architecture, which could be used in other applications, combines the advantages of the model-based approach with the efficiency requirements of real-time applications, while in general model-based approaches present serious drawbacks on this point.

23523 (EGG-M–92470) **Development of a framework of human-centered automation for the nuclear industry.** Nelson, W.R.; Haney, L.N. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930401–14: Meeting on nuclear plant instrumentation, control and man-machine interface technologies, Oak Ridge, TN (United States), 18-21 Apr 1993). Order Number DE93010789. Source: OSTI; NTIS; INIS; GPO Dep.

Introduction of automated systems into control rooms for advanced reactor designs is often justified on the basis of increased efficiency and reliability, without a detailed assessment of how the new technologies will influence the role of the operator. Such a "technology-centered" approach carries with it the risk that entirely new mechanisms for human error will be introduced, resulting in some unpleasant surprises when the plant goes into operation. The aviation industry has experienced some of these surprises since the introduction of automated systems into the cockpits of advanced technology aircraft. Pilot errors have actually been induced by automated systems, especially when the pilot doesn't fully understand what the automated systems are doing during all modes of operation. In order to structure the research program for investigating these problems, the National Aeronautics and Space

Administration (NASA) has developed a framework for human-centered automation. This framework is described in the NASA document Human-Centered Aircraft Automation Philosophy by Charles Billings. It is the thesis of this paper that a corresponding framework of human-centered automation should be developed for the nuclear industry. Such a framework would serve to guide the design and regulation of automated systems for advanced reactor designs, and would help prevent some of the problems that have arisen in other applications that have followed a "technology-centered" approach.

23524 (FEI–2113) **Properties of bilinear functionals in reactor systems and reactivity increment calculation.** Korobejnikov, V.V.; Petrov, Eh.E. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1990. [19p.] (In Russian). Order Number DE93626239. Source: OSTI; NTIS (US Sales Only); INIS.

At last time the bilinear integral functionals over closed surface including direct and adjoint functions of radiation flux, are used for solving neutron transport problem in reactor systems. An attempt to study the properties of the bilinear functional on the exluzive surface and derive the equations for the calculation of reactivity changing is made. The comparison of experiments and calculations are discussed. 5 refs.; 5 figs.; 1 tab.

23525 (INIS-mf–13502, pp. 183-197) **Trends in information processing and configuration of plant automation.** Fischer, H.D. (Siemens AG/KWU R2, Erlangen (Germany)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

A brief review is given of the most promising ways of information processing with respect to plant diagnoses in a digital I and C environment. For such an I and C system the configuration of plant automation is presented to give recommendations particularly for retrofitting existing nuclear power plants. (author) 7 figs., 4 refs.

23526 (INIS-mf–13503, pp. 187-190) **Digital nuclear instrumentation application to nuclear power plant.** Burel, J.-P. (Merlin Gerin, Grenoble (France). Departement Systemes et Electronique de Surete); Fanet, H. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The use of digital techniques for the control of nuclear reactors offers an interesting prospect in the improvement of the operation and safety of reactors. Thanks to close collaboration between Merlin Gerin and the French Atomic Energy Commission, a new piece of technology for nuclear instrumentation systems has been developed in order to meet the needs of different types of reactors. The principles of measurement are presented and the technology used is described. Other interesting points of this technology in addition to installation, operation and safety are examined. The digital neutron measurements are already operating in research reactors in France and will be installed in a different configuration in the new 1400 MW nuclear power plant. Integration into different designs is easily attainable by adapting the information transmission mode according to the technology present in the protection system and the treatment and visualization systems. (author).

23527 (INIS-mf–13503, pp. 191-194) **An investigation of axial xenon stability in WWER-1000 reactor designs.** Doshi, P.K. (Westinghouse Electric Corp., Pittsburgh, PA (United States)); Miller, R.W. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

The nuclear power plants of the WWER-1000 design have experienced frequent xenon oscillation control problems. In most PWRs, xenon oscillations are largely a problem in the axial direction. An one dimensional core model representative of the WWER-1000 design was set up to examine the controllability of the current design. An investigation of possible improvements to this design was made. There was no indication that xenon oscillations were an inherent problem in WWER-1000 core design. Simple changes to the control rod system coupled with a sound power distribution control strategy that has been proven to be an effective but simple procedure to follow, eliminate xenon control problems. The changes proposed can be implemented in a very cost effective manner. There are no equipment changes needed, existing control rods can be used. Only software changes are required. (Z.S.) 1 tab., 2 figs., 7 refs.

23528 (INIS-mf–13503, pp. 238-241) **Digital I and C for nuclear power plant.** Gemst, P. van (ABB Atom AB, Vaesteraas (Sweden)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A summary is given of the past experience (process I and C, digital controllers, Power Range Monitoring system) and future plans (integrated plant I and C, control room) of ABB Atom for programmable I and C at nuclear power plants. ABB Atom has designed and supplied an appreciable quantity of software based equipment for nuclear power plants. These have been supplied for both new plants as well as for backfitting. The well proven ABB Master system has been used for the supply of I and C equipment for these projects and will continue to be used in the future. (Z.S.) 1 fig.

23529 (JAERI-M–93-041) **Study on statistical analysis of nonlinear and nonstationary reactor noises.** Hayashi, Koji (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 160p. (In Japanese). Order Number DE93797604. Source: OSTI; NTIS; INIS.

For the purpose of identification of nonlinear mechanism and diagnosis of nuclear reactor systems, analysis methods for nonlinear reactor noise have been studied. By adding newly developed approximate response function to GMDH, a conventional nonlinear identification method, a useful method for nonlinear spectral analysis and identification of nonlinear mechanism has been established. Measurement experiment and analysis were performed on the reactor power oscillation observed in the NSRR installed at the JAERI and the cause of the instability was clarified. Furthermore, the analysis and data recording methods for nonstationary noise have been studied. By improving the time resolution of instantaneous autoregressive spectrum, a method for monitoring and diagnosis of operational status of nuclear reactor has been established. A preprocessing system for recording of nonstationary reactor noise was developed and its usability was demonstrated through a measurement experiment. (author) 139 refs.

23530 (LIYaF–1597) **On boiling out of the PIK reactor liquid regulator in the case of the emergency.** Kislitsyn, B.V.; Konoplev, K.A.; Smol'skij, S.L. AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki. Apr 1990. [27p.] (In Russian). Order Number DE93626241. Source: OSTI; NTIS (US Sales Only); INIS.

The process of heating and boiling out of the liquid regulator from circular clearance of the PIK reactor vessel in the case of emergency is considered. The time of freeing the circular clearance volume from the absorber was calculated. Balance of the reactivity for safety reactor stopping is considered. The maximum permitted time for operation of the emergency protection is estimated. 4 refs.; 11 figs.; 2 tabs.

23531 (NUREG/CR–6018) **Survey and assessment of conventional software verification and validation methods.** Miller, L.A. (Science Applications International Corp., Reston, VA (United States)); Groundwater, E.; Mirsky, S.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Science Applications International Corp., Reston, VA (United States). Apr 1993. 184p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (EPRI-TR–102106;SAIC–91/6660). Source: OSTI; NTIS; INIS; GPO.

By means of a literature survey, a comprehensive set of methods was identified for the verification and validation of conventional software. The 134 methods so identified were classified according to their appropriateness for various phases of a developmental lifecycle – requirements, design, and implementation; the last category was subdivided into two, static testing and dynamic testing methods. The methods were then characterized in terms of eight rating factors, four concerning ease-of-use of the methods and four concerning the methods' power to detect defects. Based on these factors, two measurements were developed to permit quantitative comparisons among methods, a Cost-Benefit metric and an Effectiveness Metric. The Effectiveness Metric was further refined to provide three different estimates for each method, depending on three classes of needed stringency of V&V (determined by ratings of a system's complexity and required-integrity). Methods were then rank-ordered for each of the three classes in terms of their overall cost-benefits and effectiveness. The applicability was then assessed of each method for the four identified components of knowledge-based and expert systems, as well as the system as a whole.

23532 (ORNL/FTR–4259) **Travel to Japan to present lecture on ORNL/CESAR intelligent machines research and development at the International Specialists meeting on artificial intelligence and robotics for nuclear power plants (AIR'92): Foreign trip report, May 17–27, 1992.** Mann, R.C. Oak Ridge National Lab., TN (United States). 12 Jun 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011078. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This trip report describes travel to participate in the Specialist Meeting on Applications of Artificial Intelligence and Robotics in Nuclear Power Plants - AIR'92, and presentation of an invited paper on related research and development activities at the ORNL Center for Engineering Systems Advanced Research (CESAR).

23533 (ORNL/FTR–4390) **[Nuclear reactor surveillance and diagnostics in France]: Foreign trip report, September 19–23, 1992.** Kryter, R.C. Oak Ridge National Lab., TN (United States). 5 Oct 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011741. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The first meeting of the Working Party on Surveillance and Diagnostics (WPSD) was held on September 21 and 22, 1992 at the Nuclear Energy Agency's (NEA's) new headquarters at Issy-les-Moulineaux, Paris. This Working Party, consisting of 19 experts in the field of nuclear reactor surveillance and diagnostics/in-core measurements and representing 12 Organization for Economic Cooperation and Development (OECD) member countries, was created at the November 1991 meeting of the NEA Nuclear Science Committee (NSC) and charged with (1) reviewing the current state of the art in the two somewhat related areas of plant fault detection/diagnosis and core performance/safety assessment, (2) identifying technical issues worthy of attention, (3) proposing Specialists' Meetings and/or symposia (as appropriate) to address these unresolved issues, and (4) proposing Benchmark Problems that could help delineate the relative strengths and weaknesses of alternative methods of analysis currently in use. Extensive discussion, the WPSD addressed and closed out all four of its assigned tasks with the following actions/recommendations: (1) selected WPSD members were assigned the responsibility to prepare (within 30 days) short state-of-the-art updates in 12 technical areas of identified need (see body of this FIR for details); (2) WPSD voted to recommend to NEA/NSC that Specialists' Meetings on in-core measurements and open symposia (continuing the SMORN series) on reactor surveillance and diagnostics continue to be held on a 4-year time interval, but with the schedules for the two types of meeting staggered by at least one year; and (3) WPSD voted to recommend to NEA/NSC that Benchmark Problems be pursued in the following three areas: neural networks/pattern recognition algorithms for data classification, loose-part monitoring/analyis techniques, and BWR stability analysis/prediction techniques.

23534 (RI–214) **Experimental and computation method for determination of burnup and isotopic composition of the WWER-440 fuel using the ^{134}Cs and ^{137}Cs concentrations.** Babichev, B.A.; Kozharin, V.V. Radievyj Inst., Leningrad (Russian Federation). 1990. [25p.] (In Russian). Order Number DE93626242. Source: OSTI; NTIS (US Sales Only); INIS.

An experimental and computational method for determination of burnup and actinoid concentrations in WWER fuel elements using ^{134}Cs and ^{137}Cs concentrations in fuel is considered. It is shown that the error in calculation of fuel burnup and U and Pu isotope concentrations in WWER-440 fuel elements is 1.3-4.9% provided that the error in ^{134}Cs and ^{137}Cs concentration measurements does not exceed 1.7 and 1.2%. 9 refs.; 10 figs.; 4 tabs.

23535 (UCRL-CR–109416) **Formal methods in the development of safety critical software systems: Version 3.0.** Williams, L.G. (Software Engineering Research, Boulder, CO (United States)). Lawrence Livermore National Lab., CA (United States); Software Engineering Research, Boulder, CO (United States). Apr 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012314. Source: OSTI; NTIS; GPO Dep.

As the use of computers in critical control systems such as aircraft controls, medical instruments, defense systems, missile controls, and nuclear power plants has increased, concern for the safety of those systems has also grown. Much of this concern has focused on the software component of those computer-based systems. This is primarily due to historical experience with software systems that often exhibit larger numbers of errors than their hardware counterparts and the fact that the consequences of a software error may endanger human life, property, or the environment. A number of different techniques have been used to address the issue of software safety. Some are standard software engineering techniques aimed at reducing the number of faults in a software protect, such as reviews and walkthroughs. Others, including fault tree analysis, are based on identifying and reducing hazards. This report examines the role of one such technique, formal methods, in the development of software for safety critical systems. The use of formal methods to increase the safety of software systems is based on their role in reducing the possibility of software errors that could lead to hazards.

23536 (UCRL-ID–108725) **Techniques, processes, and measures for software safety and reliability: Version 3.0.** Sparkman, D. Lawrence Livermore National Lab., CA (United States). 30 May 1992. 55p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012379. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide a detailed survey of current recommended practices and measurement techniques for the development of reliable and safe software-based systems. This report is intended to assist the United States Nuclear Reaction Regulation (NRR) in determining the importance and maturity of the available techniques and in assessing the relevance of individual standards for application to instrumentation and control systems in nuclear power generating stations. Lawrence Livermore National Laboratory (LLNL) provides technical support for the Instrumentation and Control System Branch (ICSB) of NRRin advanced instrumentation and control systems, distributed digital systems, software reliability, and the application of verificafion and validafion for the development of software.

23537 (WSRC-TR–92-547) **GRISET certification package: Revision 2.** Taylor, J.J.; Cefus, G.R. Westinghouse Savannah River Co., Aiken, SC (United States). Nov 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93011783. Source: OSTI; NTIS; GPO Dep.

The GRISET (GRIMHX setup) computer code is an input driver for the three dimensional G computer code (Reference 4). GRISET provides a method for automating the creation of G geometry and associated problem specific information such as the reactor maps and the cross section data references. GRISET provides methods which allow the user to model control rod positioning, safety rod insertion with any number failing, control rod withdrawal or insertion, and full or partial melting of control rods. GRISET also calculates the radial shape factor, tilt, roof-top-ratios, and the assembly power peaking.

23538 (BNWL-CC–1410) **An analysis of the behavior of arsenic in Hanford reactor systems.** Divine, J.R.; Nielson, W.H. Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab. 31 Oct 1967. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012049. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The origin of the radioactive materials in the effluent cooling water from the production reactors at Hanford has been the subject of much study. Interest in these materials is generated both by their tendency to accumulate in rear-face piping, with a consequent radiation hazard to the operating personnel, and by the potential contamination of the Columbia River into which the reactor coolant is ultimately discharged. This report describes the present state of development and understanding of this problem. Herein we have compared experimental results with those predicted by the model to determine the deficiencies of the model.

23539 (DOE-RAS–92.006) **Environmental radioactivity from Chernobyl.** Garland, J.A. (AEA Environment and Energy, Harwell (United Kingdom)). Department of the Environment, London (United Kingdom). Radioactive Substances Div. 1992. [22p.] Contract PECD-7/9/359. Order Number DE93625789. Source: OSTI; NTIS (US Sales Only); INIS.

A broadly based programme of environmental measurements following the Chernobyl accident is summarised and discussed. Levels of radionuclides in air and atmospheric deposition were increased substantially for a period of some weeks following the accident. The quantity of ^{137}Cs in surface soils was doubled in some regions of the North and West of the UK. Observations of the rates of deposition and resuspension, and weathering from grass, a river catchment and buildings, provided confirmation of several aspects of the environmental behaviour of ^{137}Cs, and extended understanding of these processes. Levels of ^{137}Cs in imported crops and in individuals in S. England, and the brief increase in external radiation, were generally low, confirming that the dose to the regional population was small. (author).

23540 (DPW–3990) **Suggested program for decontamination studies.** Pohl, H.A. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 5 Dec 1951. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–449). Order Number DE93011144. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum lists program items which are suggested for consideration in the proposed ANL study of decontaminating systems containing the product of ruptured U slugs in water.

23541 (DPW–4408) **Decontamination of Savannah piles.** Pohl, H.A. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 18 Jan 1952. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–433). Order Number DE93011126. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum provides a clearly defined picture of the methods in which the Savannah piles should be decontaminated. These methods were developed at a conference at Argonne National Laboratory (ANL).

23542 (DUN–3259) **Program review: Ground disposal of reactor effluent.** Geier, R.G. Douglas United Nuclear, Inc., Richland, WA (United States). 18 Oct 1967. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012155. Source: OSTI; NTIS (US Sales Only); GPO Dep.

With the exception of N Reactor the plutonium production reactors operated by Douglas United Nuclear, Inc., use treated Columbia River water as coolant on a once through basis. Thus, radionuclides formed by neutron activation of Columbia River salts not removed in the water treatment process and water treatment additives are discharged to the river. Although the quantity and possible effects of the radionuclides released are well within nationally accepted limits, emphasis has been placed for some time on reducing the releases to as low a level as possible. More recently increasing concern has been evidenced with regard to the heat which is also discharged to the river. This report discusses concept which not only would drastically reduce the radionuclide content of the river but which would also substantially decrease the heat discharge. This concept is the disposal of the reactor effluent to the ground either to a pond or to a network of trenches.

23543 (DUN–7521) **Radioactive effluent control program: Douglas United Nuclear operated AEC facilities.** Bolliger, J.R. (ed.). Douglas United Nuclear, Inc., Richland, WA (United States). 25 Jan 1971. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012064. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report is addressed to the radioactive effluent control program of (AEC) facilities operated by Douglas United Nuclear, Inc. It was prepared in response to an inquiry from Atomic Energy Commision AEC Division of Operational Safety via AEC-RL regarding quantities of radionuclides released. The current status, measurement, and activity of the program are described. In addition, other related efforts which have been deferred due to lack of funding are highlighted.

23544 (GSF–33/91) **Establishment of a real-time electronic expert system to estimate and limit radiological consequences of nuclear facility accidents in the Federal Republic of Germany. Final report.** Jacob, P. (GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Strahlenschutz); Eklund, J.; Gregor, J.; Mueller, H.; Paretzke, H.G.; Proehl, G.; Richter, M.; Stapel, R. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany); Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). Dec 1991. 223p. (In German). Contract BMU St.Sch. 1073. Order Number DE93795220. Source: OSTI; NTIS (US Sales Only); INIS.

Also published as report BMU–1992-330.

The programme system PARK is mainly based on the radioecological food chain model ECOSYS. PARK is subdivided into the system parts AUTOPARK and DIAPARK, and into the programme DOSISPARK. AUTOPARK is a mainly automatically running programme system which converts the measured data obtained by intensive operation of the 'Integrated measuring and information system for monitoring environmental radioactivity in the Federal Republic of Germany (IMIS)', and the propagation calculations provided by the German Weather Service, into a full-scale assessment of nuclide-specific contamination of air, soil and 20 plant species. Based on such calculation results, the potential radiation exposures of the public are assessed, the expected contamination of food is prognosticated, and the effects of the preventive measures 'recommendation of staying indoors' and 'prohibition of marketing higher-level contaminated food' are investigated for ten relevant radionuclides. (orig.).

23545 (NUREG/CR–4214-Rev.1-Pt.2-Add.2) **Health effects models for nuclear power plant accident consequence analysis: Modification of models resulting from addition of effects of exposure to alpha-emitting radionuclides: Revision 1, Part 2, Scientific bases for health effects models, Addendum 2.** Abrahamson, S. (Wisconsin Univ., Madison, WI (United States)); Bender, M.A.; Boecker, B.B.; Scott, B.R.; Gilbert, E.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst.; Wisconsin Univ., Madison, WI (United

States); Brookhaven National Lab., Upton, NY (United States); Pacific Northwest Lab., Richland, WA (United States). May 1993. 71p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (LMF–136). Source: OSTI; NTIS; INIS; GPO.

The Nuclear Regulatory Commission (NRC) has sponsored several studies to identify and quantify, through the use of models, the potential health effects of accidental releases of radionuclides from nuclear power plants. The Reactor Safety Study provided the basis for most of the earlier estimates related to these health effects. Subsequent efforts by NRC-supported groups resulted in improved health effects models that were published in the report entitled "Health Effects Models for Nuclear Power Plant Consequence Analysis", NUREG/CR-4214, 1985 and revised further in the 1989 report NUREG/CR-4214, Rev. 1, Part 2. The health effects models presented in the 1989 NUREG/CR-4214 report were developed for exposure to low-linear energy transfer (LET) (beta and gamma) radiation based on the best scientific information available at that time. Since the 1989 report was published, two addenda to that report have been prepared to (1) incorporate other scientific information related to low-LET health effects models and (2) extend the models to consider the possible health consequences of the addition of alpha-emitting radionuclides to the exposure source term. The first addendum report, entitled "Health Effects Models for Nuclear Power Plant Accident Consequence Analysis, Modifications of Models Resulting from Recent Reports on Health Effects of Ionizing Radiation, Low LET Radiation, Part 2: Scientific Bases for Health Effects Models," was published in 1991 as NUREG/CR-4214, Rev. 1, Part 2, Addendum 1. This second addendum addresses the possibility that some fraction of the accident source term from an operating nuclear power plant comprises alpha-emitting radionuclides. Consideration of chronic high-LET exposure from alpha radiation as well as acute and chronic exposure to low-LET beta and gamma radiations is a reasonable extension of the health effects model.

23546 (WSRC-TR–92-261) **A model for radionuclide transport in the Cooling Water System.** Kahook, S.D. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1992. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012149. Source: OSTI; NTIS; INIS; GPO Dep.

A radionuclide transport model developed to assess radiological levels in the K-reactor Cooling Water System (CWS) in the event of an inadvertent process water (PW) leakage to the cooling water (CW) in the heat exchangers (HX) is described. During and following a process water leak, the radionuclide transport model determines the time-dependent release rates of radionuclide from the cooling water system to the environment via evaporation to the atmosphere and blow-down to the Savannah River. The developed model allows for delay times associated with the transport of the cooling water radioactivity through cooling water system components. Additionally, this model simulates the time-dependent behavior of radionuclides levels in various CWS components. The developed model is incorporated into the K-reactor Cooling Tower Activity (KCTA) code. KCTA allows the accident (heat exchanger leak rate) and the cooling tower blow-down and evaporation rates to be described as time-dependent functions. Thus, the postulated leak and the consequence of the assumed leak can be modelled realistically. This model is the first of three models to be ultimately assembled to form a comprehensive Liquid Pathway Activity System (LPAS). LPAS will offer integrated formation, transport, deposition, and release estimates for radionuclides formed in a SRS facility. Process water and river water modules are forthcoming as input and downstream components, respectively, for KCTA.

23547 (ANL/NPR–93/4) **Analysis of fission gas behavior and foaming of molten uranium- aluminum alloy fuel for nuclear reactors: New Production Reactors Program.** Gruber, E.E.; Kramer, J.M. Argonne National Lab., IL (United States). Sep 1990. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93010625. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report begins with a review of the models selected to analyze fission-gas foaming in molten U-Al alloy fuel for nuclear reactors. The models were incorporated into the FRAS/FOAM code for initial testing and scoping calculations. The FRAS/FOAM calculations were verified by comparing the results for a simplified problem to analytical results. The molten-fuel models were then incorporated into the FRAS3 code for further model developments that extend the analysis into the foaming regime for molten U-Al fuel. The most significant of the new models is the one for bubble sweeping, which extends the earlier pair-wise coalescence model to conditions appropriate for foaming to occur. Results are presented that indicate foaming can occur on time scales as short as 10 to l00ms after melting begins. The dependence of the timing and potential amount of foaming on the pressure and fuel burnup are also presented. A number of assumptions applied in these calculations, however, tend to overestimate the rate of bubble coalescence and growth. Directions for further work in this modeling effort are described. They include incorporation of a fuel-melting model into the FRAS3 code, so that a two-field calculation of melting fuel can be carried out.

23548 (BNWL-CC–1410-Suppl.) **An analysis of the behavior of arsenic in Hanford reactor systems.** Divine, J.R. Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab. Dec 1967. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012050. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report provides an analysis and experimental data on arsenic in the reactor cooling system.

23549 (CONF-930803–8) **Pipe break testing of primary loop piping similar to Department of Energy's New Production Reactor-Heavy Water Reactor.** Poole, A.B.; Clinard, J.A.; Battiste, R.L.; Hendrich, W.R. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology; Stuttgart (Germany); 16-20 Aug 1993. Order Number DE93011863. Source: OSTI; NTIS; INIS; GPO Dep.

The subject of this paper is to review the recent failure testing of the Savannah River C-reactor piping weldment, which will be referred to as the C-pipe in the remainder of the paper. The intent of this paper is to further familiarize the technical community with Oak Ridge National Laboratory's (ORNL) pipe test program and associated activities surrounding the C-pipe test as conducted on behalf of the Department of Energy New Production Reactor (DOE-NPR) Program.

23550 (CONF-930830–6) **Experimental investigation of thermal limits in parallel plate configuration for the Advanced Neutron Source Reactor.** Siman-Tov, M.; Felde, D.K.; Kaminaga, M.; Yoder, G.L. Oak Ridge National Lab., TN (United States). [1993]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From National conference and exposition on heat transfer; Atlanta, GA (United States); 8-11 Aug 1993. Order Number DE93008274. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Neutron Source Reactor (ANSR) is currently being designed to become the world's highest-flux, steady-state, thermal neutron source for scientific experiments. Highly subcooled, heavy-water coolant flows vertically upward at a very high velocity of 25 m/s through parallel aluminum fuel-plates. The core has average and peak heat fluxes of 5.9 and 12 MW/m^2, respectively. In this configuration, both flow excursion (FE) and true critical heat flux (CHF), represent potential thermal limitations. The availability of experimental data for both FE and true CHF at the

conditions applicable to the ANSR is very limited. A Thermal Hydraulic Test Loop (THTL) facility was designed and built to simulate a full-length coolant subchannel of the core, allowing experimental determination of both thermal limits under the expected ANSR T/H conditions. A series of FE tests with water flowing vertically upward was completed over a nominal heat flux range of 6 to 14 MW/m^2 and a corresponding velocity range of 8 to 21 m/s. Both the exit pressure (1.7 MPa) and inlet temperature (45°C) were maintained constant for these tests, while the loop was operated in a "stiff"(constant flow) mode. Limited experiments were also conducted at 12 MW/m^2 using a "soft" mode (near constant pressure-drop) for actual FE burnout tests and using a "stiff' mode for true CHF tests, to compare with the original FE experiments.

23551 (DOE/ER/75728–1) **Support of nuclear engineering education and research at the University of Michigan: Progress report, May 15, 1992–May 14, 1993.** Martin, W.R. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75728. Order Number DE93012987. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes progress on four different projects in the fission reactor area that have been supported by the grant during the past year. These projects are: Accelerator transmutation of nuclear waste (Steve Pearson); neutronic analysis of the Ford Nuclear Reactor (Brent Renkema); developing Monte Carlo benchmarks for commercial LWR configurations (Jie Du); Monte Carlo depletion capability for massively parallel processors (Amit Majumdar); these tasks are briefly described and progress to date is presented.

23552 (DOE/ER/75729–1) **Nuclear Power Engineering Education Program, University of Illinois: Progress report, May 15, 1992–March 31, 1993.** Jones, B.G. Illinois Univ., Urbana, IL (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75729. Order Number DE93012808. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE/CECo Nuclear Power Engineering Education Program at the University of Illinois in its first year has significantly impacted the quality of the power education which our students receive. It has contributed to: the recently completed upgrade of the console of our Advanced TRIGA reactor which increases the reactor's utility for training, the procurement of new equipment to upgrade and refurbish several of the undergraduate laboratory set-ups, and the procurement of computational workstations in support of the instructional computing laboratory. In addition, smaller amounts of funds were used for the recruitment and retention of top quality graduate students, the support of faculty to visit other institutions to attract top students into the discipline, and to provide funds for faculty to participate in short courses to improve their skills and background in the power area. These items and activities have helped elevate in the student's perspective the role of nuclear power in the discipline. We feel this is having a favorable impact on student career selection and on ensuring the continued supply of well educated nuclear engineering graduates.

Order Number DE93012047. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report documents discussion at a meeting concerning the construction of the Explosives Department at the Savannah River Plant.

23558 (DPW–53-1232) **Weekly report, September 7–11, 1953, Sylvania Electric Products Company (25730-700).** Gamel, C.M. Jr. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 14 Sep 1953. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–373). Order Number DE93008317. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This weekly report discusses progress by Sylvania Electric Products Company in the production of powder metal flat plates.

23559 (DPW–53-1430) **[Progress on chromium barrier layers for extended surface fuel elements]: Trip report, November 18, 1953.** Pocalyko, A. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 11 Dec 1953. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–402). Order Number DE93010101. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In addition to depositing chromium barrier layers on uranium strip by their pack-carburizing type technique NRC was requested and agreed to submit for AED evaluation chromium coatings prepared by a vacuum thermal evaporation process. Coatings produced by the latter method will be subsequently heat-treated in an attempt to improve corrosion resistance in boiling distilled water.

23560 (DPW–3694) **[Travel to the Lummus Company, New York City for review of Heat Exchanger Tube Sheet Design, Savannah River Plant, 400D Area]: Trip report, October 23, 1951.** Kuhn, B.D. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 2 Nov 1951. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–473). Order Number DE93011170. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum details a visit to the Lummus company in New York City on October 23rd, 1951 to discuss the design of the C.F. Braun company's heat exchanger tube sheets.

23561 (DPW–3720) **100 Area, water requirements.** Bellas, H.W. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 6 Nov 1951. 2p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC09-76SR00001. (SR/H–480). Order Number DE93011177. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum provides a summary of latest thinking on 100 Area water flows and requirements. Filtered, service, and cooling water demands are tabulated.

23562 (DPW–3816) **[Heat exchangers for Savannah River Reactors].** Johnson, A.A. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 15 Nov 1951. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–406). Order Number DE93010105. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum provides information developed on heat exchangers for the Savannah River Piles. Discussed in the sections that follows are current design of heat exchangers and coolant circulating system, general considerations that led to this design and are alternate designs that were considered.

23563 (DPW–3909) **[Travel to Argonne National Laboratory for discussions concerning ZPR-2]: Trip report, November 15, 1951.** Dessauer, G. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 26 Nov 1951. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–453). Order Number DE93011148. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum details a visit to Argonne National Laboratory (ANL) on November 15, 1951. The following items were discussed: Progress on ZPR-2 in general; Procedures for removing control assemble for handling fuel tubes; Control actuator, control ganging, and annunciator design; Collaboration between ANL Physics Division and ZPR-2 crew; Experimental program - Liaison with du Pont.

23564 (DPW–3989) **[Travel to Monsanto to discuss the problem of decontaminating the cave in the disassembly area in the event of 5Y3 slug rupture]: Trip report, November 21, 1951.** Langhaar, J.W. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 5 Dec 1951. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–458). Order Number DE93011153. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report details a trip to Monsanto to discuss a slug contamination, slug jacket removal, and the rectilinear manipulator.

23565 (DPW–4148) **Recovery of D_2O from fuel tubes.** Pohl, H.A. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 19 Dec 1951. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–445). Order Number DE93011139. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum describes a number of proposals for removing adhering D_2O from fuel tubes as they are unloaded. It is estimated that some $5000–10,000 worth of D_2O clings to the Q-tubes as they are unloaded.

23566 (DPW–4295) **[Travel to New York to attend a meeting which was held at the New York Operations Office for the discussion of thorium]: Trip report, November 6, 1951.** Montenyohl, V.I.; Hayes, E.E. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 3 Dec 1951. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–460). Order Number DE93011155. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses travel to New YORK to attend a meeting which was held at the New York Operations Office for the discussion of thorium.

23567 (DPW–4489) **Reactor fuel elements.** Neill, J.S. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 29 Jan 1952. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–464). Order Number DE93011159. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Clumping of the fuel rods in a Q-foil results in a peripheral variation in the surface heat flux emanating from the rod. By placing the fuel rods exccentric in the tubes and inward toward the center of the Q-foil a more uniform surface temperature will be realized. Accordingly, an eccentricity of 25 mils for the 1 in. rod in the Q-foil has been recommended by W. A. Selke. Because of the necessary clearances between the rod and the rib circle of 33 mils, as given by G. E. Boudreau, the actual eccentricity will deviate from this nominal eccentricity of 25 mils. The purpose of this memorandum is to show the variation of the power loss with the actual eccentricity and to point out what the clearance costs in power.

23568 (DPW–4836) **Savannah River Plant estimated power costs, fiscal year 1953–1956.** Kaiser, A.H. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 12 Mar 1952. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–507). Order Number DE93011204. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report provides estimated power costs for fiscal years 1953, 1954, 1955, and 1956 for the Savannah River Plant as requested by the AED Control Division. An explanation of the assumptions used preparing the estimated power costs and a description of power facilities involved are also given.

23569 (DPW–4851) **NYX construction progress.** Elliott, J.F. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 13 Mar 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–506). Order Number DE93011203. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report provides a progress report of the NYX construction progress. Details are presented on the problems in line boring of the plenum and top shield.

23570 (DPW–4906) **New fuel element development report of meeting held March 18, 1952.** Huntoon, R.T. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 19 Mar 1952. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–503). Order Number DE93011200. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The principle interest of this meeting was the discussion of a tentative program for corrosion testing to be presented to ANL. The requirements of the tests were outlined and specifications for specimens were detailed. Fabrication and sheathing of the elements was briefly discussed and it was agreed that the first experimental elements to be produced will be alpha rolled uranium or uranium-zirconiums alloys sheathed with aluminum applied by cold drawing.

23571 (DPW–4908) **Background flux in Pu producer.** Ring, H.F.; Crandall, J.L. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 19 Mar 1952. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–504). Order Number DE93011201. Source: OSTI; NTIS (US Sales Only); GPO Dep.

With all rods fully inserted in the 61 septifoil positions of the Pu producer, the file is subcritical by about 8% in k; however, because of spontaneous fissions in the metal, there persists in the pile a measurable, albeit small, background flux. In this memorandum the static background flux, for various subcritical control rod configurations, has been calculated.

23572 (DUN–850-1) **Manufacturing Section semiannual summary report, period ending June 30, 1966.** DeNeal, D.L. Douglas United Nuclear, Inc., Richland, WA (United States). 1 Sep 1966. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012051. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is the second semiannual issue of reactor and power operations data for the Hanford Production Reactors. Summary data from the first issue (1) are repeated for comparison. Experience during each succeeding six months period will be added to these data in later reports until two full years of operating experience are shown. For comparison purposes, the two years of experience will then continue to be shown by dropping and adding a six months period with each semiannual issue. This report is for the period ending June 30, 1966.

23573 (DUN–850-2) **Manufacturing Section semiannual summary report, period ending December 31, 1966.** DeNeal, D.L. Douglas United Nuclear, Inc., Richland, WA (United States).

31 Jan 1967. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012052. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this third semiannual issue, the reactor and power data from the Hanford Production Reactors are shown for the six-month period July through December, 1966, together with the two preceding six-month periods. Experience during the succeeding six-month period will be added in the next semiannual issue. For comparison purposes, the two years of experience will then continue to be shown by dropping and adding a six-month period with each semiannual issue.

23574 (DUN–850-3) **Manufacturing Section semiannual summary report, period ending June 30, 1967.** DeNeal, D.L. Douglas United Nuclear, Inc., Richland, WA (United States). 15 Sep 1967. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012053. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this fourth semiannual issue, the reactor and power data from the Hanford Production Reactors are shown for the six-month period January through June, 1967, together with data for the three preceding six-month periods. For comparison purposes, the two years of experience will continue to be shown by dropping and adding a six- month period with each semiannual issue.

23575 (DUN–4977) **Water treatment test facility studies, July 1964–July 1967.** Geier, R.G. Douglas United Nuclear, Inc., Richland, WA (United States). 5 Nov 1968. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012157. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The water treatment test facility consists of eight process tubes in KE. Reactor which can be supplied with coolant independently of the normal reactor coolant supply. Raw water, service water, process water, deionized water, or water specially treated in a water treatment pilot plant can be used as coolant. The facility, has been in use for many-years to study the effects of coolant modifications on corrosion. More recently, it has also been a test facility in the research and development program directed toward finding means to reduce the quantity of radioactivity data. This document summarizes the tests carried out during the period from July 1964 through July 1967. Effluent radioactivity data are presented as well as the visual characteristics and the weight loss data of the fuel elements irradiated during the tests. An in-depth analysis of the corrosion information has not been attempted, but where significant changes in corrosion were apparent, they have been noted.

23576 (DUN–5566-3) **Single pass reactors: Operations Division semiannual summary report period ending June 30, 1970.** Prudich, T. Douglas United Nuclear, Inc., Richland, WA (United States). 3 Sep 1970. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012058. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this semiannual issue the single pass reactor and water plant data are shown for the six-month period January through June, 1970, together with data for the three preceding six-month periods.

23577 (DUN–5566-4) **Single pass reactors: Operations Division semiannual summary report period ending December 31, 1970.** Prudich, T. Douglas United Nuclear, Inc., Richland, WA (United States). 20 Jan 1971. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012059. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this semiannual issue the single pass reactor and water plant data are shown for the six-month period July through December, 1970, together with data for the three preceding six-month periods.

23578 (DUN–6463) **Dichromate evaluation.** Carlson, P.A. Douglas United Nuclear, Inc., Richland, WA (United States). 4 Nov 1969. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012061. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Fuel failure statistics coupled with preliminary results from the half-plant dichromate test recently completed at KW Reactor show that process water with 0.5 ppm dichromate is significantly more corrosive than process water containing 1.0 ppm dichromate with respect to localized aluminum cladding corrosion. This report provides interim water chemistry specifications subject to revision when the test data analysis is complete.

23579 (DUN–6476) **Memorandum of process standards 9-16M sodium dichromate and pH requirements, K Reactors.** Reid, R.W. Douglas United Nuclear, Inc., Richland, WA (United States). 18 Nov 1969. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012062. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this memorandum is to provide interim limits for a lower sodium dichromate feed to reduce water treatment costs. The interim limits are a function of exit water temperature and pH. The process standards will be revised when current studies on the effects of dichromate reduction are completed.

23580 (DUN–7166) **K Reactor dichromate test results.** Carlson, P.A. Douglas United Nuclear, Inc., Richland, WA (United States). 29 Jul 1970. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012063. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum provides a discussion of the K Reactor dichromate test results. Recommendations as to sodium dichromate concentration control are provided. (FL)

23581 (DUN–7253) **Half-plant low dichromate evaluation at KW Reactor: Production Test-176: Final report.** Larrick, A.P. Douglas United Nuclear, Inc., Richland, WA (United States). 30 Sep 1970. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012160. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This final report details production test-176, the primary purpose of which was to provide a quantitative comparison of fuel element 8001 aluminum alloy cladding corrosion in cooling water containing 0.5 and 1.0 ppm sodium dichromate inhibitor. Secondary purposes were to provide information on cladding corrosion as a function of temperature and as a function of time at both inhibitor concentrations. The primary purpose was well fulfilled: Equations were developed to describe and predict fuel element weight losses at both dichromate concentrations and the effect of dichromate concentration on localized corrosion was clearly established. Little effect of dichromate concentration on localized corrosion was observed when fuel cladding temperatures were below 115–120 C but above these temperatures the localized corrosion definitely was more severe in coolant containing 0.5 ppm inhibitor. The bottom rows of fuel element supports rapidly corroded away at the higher temperatures which caused a further increase in local temperatures due to flow imbalances and this in turn accelerated the localized corrosion. Because the higher dichromate concentration reduced the amount of support corrosion, 1.0 ppm dichromate should be employed to control localized corrosion whenever cladding temperatures are expected to be above 120 C for long periods of time. These tests indicated that the corrosion occurring at exposures of 66 operating days, and with clad temperatures of 120 C or above, would not seriously limit fuel integrity at 0.5 ppm inhibitor but that for exposures of 105 operating days extensive pitting corrosion would be expected.

23582 (EGG-NRE–10735) **Broad Application Test Reactor cost reduction study.** Sekot, J.P. (USDOE Idaho Field Office, Idaho Falls, ID (United States)); Amidei, W.; Kologi, A.L.; Lopez, D.A.; McDaniel, J.H.; Mousseau, D.R.; Motloch, C.G.; Pierce, R.L.; Rogers, N.K.; Ryskamp, J.M.; Sherick, D.M.; Sorman, K.L.; Stanley, V.R.; Werner, J.EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013741. Source: OSTI; NTIS; INIS; GPO Dep.

A Broad Application Test Reactor (BATR) is needed to provide nuclear testing capacity and capability for future testing needs. The BATR concept is expected to consider a broad range of test applications. The present day costs of design and construction of new nuclear facilities demands that methods, processes, and requirements be critically reviewed and improved if these facilities are to be affordable in the future. The cost of major new projects in this

country has been escalating faster than the rate of inflation. For example, the Advanced Test Reactor (ATR), a reactor built at the Idaho National Engineering Laboratory (INEL) in the early sixties, cost about $38M in 1960 dollars. Estimates to build that same reactor today range as high as $1B. Although somewhat different in mission, but in many respects comparable to theATR in function, size, and complexity, the Advanced Neutron Source (ANS) proposed by the Oak Ridge National Laboratory (ORNL), is currently estimated to cost about $2B for design and construction. This report presents cost concerns, cost reduction ideas, and recommendations that were identified and developed by the Cost Reduction Study Team for consideration by the BATR Design Team.

23583 (ERA-NRE–93-022) **Measured thermal and fast neutron fluence rates, ATR Cycle 99-B, January 24–March 14, 1993.** Murray, R.K.; Rogers, J.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). Apr 1993. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013682. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the thermal (2200 m/s) and fast (E>1MeV) neutron fluence rate data for ATR Cycle 99-B which were measured by the Radiation Measurements Laboratory (RML) as requested by the Power Reactor Programs (ATR Experiments) Radiation Measurements Work Order. This report contains fluence rate values corresponding to the particular elevations (relative to the 80 ft core elevation) where the measurements were taken. The data in this report consists of (1) a table of the ATR power history and distribution, (2) a hard copy listing of all thermal and fast neutron fluence rates, (3) plots of both the thermal and fast neutron fluence rates, and (4) a magnetic record (3.5 inch diskette) containing a listing of only the fast neutron fluence rates, their assigned elevations and proper header identification of all monitor positions contained herein. The fluence rates reported are for the average power levels given in the table of power history and distribution. All "H" holder monitor wires for this cycle are 54 inches long. All "SR" holder monitor wires for this cycle are 55 inches long. This length allows measurement of the full core region and makes the first count elevation 24.73 inches above core midplane. Due to the safety rod problems in the west lobe, "BR" holders were used in the W-1, 2, 3, and 4 positions. All "BR" holder monitor wires for this cycle are 56.25 inches long. The distance from the end of the wires to the first count position was 4.25 inches for all wires counted from this cycle. The results from the measurements in the W-1, 2, 3, 4 monitor positions indicate that the safety rod followers were rotated to a different azimuthal orientation relative to the normal orientation. The results indicate that the rotation was counterclockwise from their normal orientation.

23584 (FEI–2114) **Realization of the technique for evaluation of integral experiments under the BFS bench conditions.** Bednyakov, S.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1990. [18p.] (In Russian). Order Number DE93626299. Source: OSTI; NTIS (US Sales Only); INIS.

The HEEPC universal calculational complex providing adequate conditions for calculations and BFS measurements has been created. The HEEPC complex allows to analyse central reactivity worths, integral fission and capture cross-sections, multiplication factors of infinite and finite critical media measurements. Adequate conditions of calculational and experimental data are received by correct evaluation of cell structure heterogeneity, experimental samples self-shielding and adjoint flux resonance structure. 10 refs.

23585 (HAN–54065) **100 and 300 Areas monthly report, December 1954.** Paulovich, K.F.; Scott, G.F. USAEC Hanford Operations Office, Richland, WA (United States). 4 Jan 1955. 312p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012060. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is a compilation of the monthly reports for the 100 and 300 Areas at HAPO for 1954. Reactor fuels, reactor technology, and reactor operation are discussed.

23586 (HAN–58378-Del.) **Reactor Operation Branch monthly reports, January–December 1955.** Paulovich, K.F. US-AEC Hanford Operations Office, Richland, WA (United States); Battelle Pacific Northwest Lab., Richland, WA (United States). 1 Sep 1955. 154p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012065. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document provides the monthly reports for the Reactor Operation Branch for the months of January through December 1955.

23587 (HW–7-2172) **Spectroscopic analysis of pile gas.** Dineen, F.H. Hanford Atomic Products Operation, Richland, WA (United States). 10 Aug 1945. 1p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012066. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum provides results of spectroscopic analysis of pile gas which were completed on August 4, 1945.

23588 (HW–37945) **Information on irradiation facilities and supporting laboratories at HAPO.** Clark, W.H. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 8 Jun 1955. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93010545. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document has been prepared in response to a request from the Atomic Energy Commission, HOO. It is a compilation of the major experimental irradiation spaces and supporting facilities at Hanford. The information is of necessity sketchy but considered adequate for survey,purposes. Organizations planning single experiments or extensive irradiation.programs are advised to seek guidance through AEC-HOO. The legend is presented largely for the benefit of those totally unfamiliar with the Hanford reactors.

23589 (HW–44097) **Reactor gas loss analysis.** Dow, T.D. Hanford Atomic Products Operation, Richland, WA (United States). 12 Jul 1956. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012067. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Reactor gas costs have increased substantially each year since 1952 when the total cost was $108,000. In 1953, 1954, and 1955 the gross annual cost of reactor gas was $126,000, $348,000 and $606,000 respectively and are reported in Figure 1. These continued increases in reactor gas costs indicate the need for an analysis of gas usage and formulation of a program to reduce gas consumption. To provide basic information for such a program, a critical review has been made of the reaction gas system and gas consumption figures for the past four years.

23590 (HW–55819) **Graphite radiation damage as a reactor operational problem.** Curtiss, D.H. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 14 Apr 1958. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-571202–1: US-UK graphite conference, London (United Kingdom), 16-18 Dec 1957). Order Number DE93009990. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Radiation Damage to the graphite moderator has played an important role in the history of reactor operation at Hanford. The operational problems, potential and real, which result from dimensional instability, stored energy, and gasification, as well as the solutions to these problems are discussed. The key to the graphite problems is operating temperature and its control. At present, stack expansion remains in the fringe regions of the original reactors, which coupled with the contraction of the central region gives rise to curvature problems in the top portion of the reactors. Stored energy is not a safety hazard because the release spectrum is such that a spontaneous and self sustained release cannot occur. Oxidation of the graphite moderator is controlled by maintaining operating temperature of the stack such that no significant amount of oxidation occurs.

23591 (HW–55862) **Separan for water treatment.** Pitman, R.W.; Conley, W.R. Hanford Atomic Products Operation, Richland, WA (United States). 5 Jan 1956. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012068. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Separan is a now water plant coagulant chemical which was submitted to the Process Sub-Section for evaluation in late 1954. Beaker tents were run which showed the material to be potentially valuable in modern water filter plants, but thorough evaluation was impossible because proper testing facilities were not available. Since August 1955, Process Sub-Section has operated an experimental filter plant which has shown promise as an evaluation tool. Consequently, as the facility appeared to be adequate for testing Separan, a trial run was made. The results have been so promising that an interim report was thought desirable. The results of our primary tests follow.

23592 (HW–72383) **Production Test IP-485-A – Fuel element film formation studies.** Geier, R.G. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 22 Jan 1962. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012069. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objectives of the test described in this report was to determine the inventory of radionuclides in the films on standard production reactor fuel elements and the corrosion of these fuel elements as a function of position in the reactor.

23593 (HW–77683) **Provisional specifications for the hot die sizing process.** Burgess, C.A.; Stinger, J.T.; Greager, O.H. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 20 May 1963. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93010555. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Hot die sizing is one of three solid state diffusion bonding (SSDB) processes that has been proposed as an alternate manufacturing process for fabricating HAPO metallic uranium, aluminum-clad fuel elements. This document establishes the provisional process specifications for the assembly of fuel elements by the hot die sizing process. These specifications were developed for the CDB2N model fuel element (CSN equivalent AlSi model) and do not necessarily apply to any other model.

23594 (HW-SA–7377) **Technical bases for K Reactor dichromate and pH control.** Larrick, A.P. Douglas United Nuclear, Inc., Richland, WA (United States). 12 Nov 1970. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (DUN–7377). Order Number DE93012071. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum was written to provide additional technical basis for preparing Process Standards. Fuel surface-tube outlet temperature data is also provided. These data will help establish dichromate concentration and coolant pH based on the outlet coolant temperatures of the hottest reactor process tubes.

23595 (IAEA-TECDOC–690, pp. 159-168) **Relation between gasification rates and gas desorption behavior with metallic impurities of carbon and graphite materials for the HTTR.** Nomura, S. (Japan Atomic Energy Research Inst., Tokai, Ibaraki, (Japan). Dept. of Fuels and Materials Research); Fujii, K.; Shindo, M.; Imai, H. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Gasification rates of carbonaceous materials by water vapor and carbon dioxide were strongly dependent upon both the kind of metallic impurities and their concentrations present in the materials. Similar relations were also held for gas desorption behavior from the carbonaceous materials. Seventeen kinds of carbons and graphite were oxidized in helium flow containing 0.65% of water vapor and carbon dioxide in the temperature range from 800 to 1000 deg. C. The rates of reaction with carbon dioxide were relatively equal to those with water vapor. The gasification rates increased with the sum of contents of transition metal impurities Fe, Ti, V and Ni. Structural parameters of the carbonaceous materials, the degree of graphitization, the crystallite size Co and c-axis lattice strain of the graphite crystallite hardly affected and gasification rates. The compensation effect between the activation energies and the pre-exponential factors of the reaction was found to exist in both gasifications. This means that the gasification is governed by catalytic action of the metallic impurities. Isokinetic temperatures, at which all catalyst lose their activity, were 1230 deg. C for the reaction with water vapor and 1120 deg. C with carbon dioxide. Six kinds of carbonaceous materials and some metallic impurities doped natural graphite powder compacts were used for the gas desorption experiments. Gases evolved from the materials up to 1000 deg. C were CO_2, CO, H_2, CH_4 and physically adsorbed species, N_2, O_2 and H_2O. Total volume of the former group of gases evolved from the graphite materials was correlated to both; their ash contents and the gasification rates with water vapor at 1000 deg. C. The effect of metallic impurities Ca, Fe, Ni, Al and Si on the former gas species evolution behavior was also investigated. (author). 16 refs, 17 figs, 3 tabs.

23596 (JAERI-M–92-201) **Characteristics of the JRR-3M neutron guide tubes.** Suzuki, Masatoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ichikawa, Hiroki; Kawabata, Yuji. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1993. 22p. (In Japanese). Order Number DE93797509. Source: OSTI; NTIS; INIS.

Large scale neutron guide tubes have been installed in the upgraded JRR-3 (Japan Research Reactor No.3, JRR-3M). The total length of the guide tubes is 232m. The neutron fluxes and spectra were measured at the end of the neutron guide tubes. The neutron fluxes of thermal neutron guide tubes with characteristic wavelength of 2A are 1.2×10^8 n/cm^2 · s. The neutron fluxes of cold guide tubes are 1.4×10^8 n/cm^2 · s with characteristic wavelength of 4A and 2.0×10^8 n/cm^2 · s with 6A when the cold neutron source is operated. The neutron spectra measured by time-of-flight method agree well with their designed ones. (author).

23597 (JAERI-M–93-002) **Evaluation for material inspection of graphite inspection standard in High Temperature Engineering Test Reactor.** Iyoku, Tatsuo (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Takikawa, Noboru; Shiozawa, Shusaku; Sawa, Kazuhiro; Tsuji, Masanobu; Yamada, Kunitaka; Sugihara, Tetsuya. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1993. 33p. (In Japanese). Order Number DE93797568. Source: OSTI; NTIS; INIS.

The graphite inspection standard for the High Temperature Engineering Test Reactor (HTTR) consists of material, nondestructive, dimensional and visual inspections. The inspection method and judgement criteria in the material inspection are nor detailed in some items, although some explanations are provided for the items especially necessary to be considered in the inspection. Therefore, inspection method and judgement criteria in the material inspection which contains material grade, impurity and mechanical strength inspections, are fully evaluated on the basis of the feature of these materials. Material inspection method and judgement criteria for HTTR graphite and carbon are evaluated in consideration of the research data and manufacturing experiences. As a result, inspection method and judgement criteria can be established, which are to be applied to the graphite and carbon internal acceptance tests of HTTR. (author).

23598 (LIYaF–1563) **Advanced irradiation of indicative vessel samples in the PIK reactor core.** Vasil'ev, G.Ya.; Egodurov, S.D.; Konoplev, K.A.; Pikulik, R.G.; Potapov, I.A.; Smol'skij, S.L.; Solovej, V.L.; Chmshkyan, D.V. AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki. Dec 1989. [11p.] (In Russian). Order Number DE93626300. Source: OSTI; NTIS (US Sales Only); INIS.

Possibility of advanced irradiation of indicative vessel samples by fast neutron fluence in the PIK reactor core has been investigated. Fast neutron flux density Φ (neutron energy being above 1.2 MeV) in the core and in the model ampoules with indicative samples has been measured in the critical assambly called Physical model of the PIK reactor and calculated by Monte-Carlo TAU code. The value of Φ in indicative vessel samples irradiated in the middle part of the core is 1.7 ± 0.1 times greater than the value of Φ on the inner surface of the vessel. 5 refs.; 2 figs.; 1 tab.

23599 (ORNL/FTR–4200) **Travel to Japan to participate in a discussion session at the fourth international symposium on advanced nuclear research: Foreign trip report, January 21, 1992–February 8, 1992.** Bloom, E.E. Oak Ridge National Lab., TN (United States). 25 Feb 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011029. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended, presented an invited paper, and participated in a discussion session at the Fourth International Symposium on Advanced Nuclear Energy Research Roles and Direction of Materials Science in Nuclear Technology, which was held on February 5–7, 1992, in Mito, Ibaraki, Japan. This report summarizes the technical content and the traveler's impressions of the symposium. Prior to the travel to Japan, the traveler participated in a meeting of the Steering Committee for the US/Japan Collaborative Program for Testing Structural Materials with Mixed Spectrum Reactors (January 22, 1992) and Joint Japan Atomic Energy Research Institute (JAERI)/Monbusho/US Department of Energy (DOE) Workshop on Mid-Program Review of Technical Progress (January 24–25, 1992) in Honolulu, Hawaii. Brief summaries of these two meetings are also included in this trip report.

23600 (ORNL/FTR–4302) **[Travel to France and New Orleans to discuss the analysis and testing work at the New Production Reactor-Heavy Water Reactor]: Foreign trip report, June 10–25, 1992.** Poole, A.B. Oak Ridge National Lab., TN (United States). 26 Jun 1992. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011070. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler presented a paper on "Thermal Stress Models for Stratified Flows and Fatigue Calculation Methods for Time-Varying Boundary Conditions such as Thermal Striping Gradients Together with 60-Year Lifetime Analysis and Full-Scale Flawed Pipe Fracture Testing" at the Symposium in Paris. This paper discussed the analysis and testing work completed at the Oak Ridge National Laboratory (ORNL) for the Department of Energy's (DOE's) New Production Reactor-Heavy Water Reactor (NPR-HWR) Program. In particular, computer analysis studies of fatigue crack growth in stainless steel type 316LN material over a projected lifetime of 60 years were presented. Also, the Pipe Impact Testing Facility (PITF) at ORNL was reviewed and some general test results discussed. There was an international exchange of new testing methodologies (fatigue and fracture tests) with specific emphasis on "Automation" through the use of computers looped directly in the collection of data and programmed to facilitate the testing process. The traveler also attended the 1992 ASME PVP Conference in New Orleans, Louisiana. At the PVP Conference, a paper was presented on "Pipe Break Testing of Primary Loop Piping Similar to DOE's NPR-HWR". In addition to the paper, a video presentation was made showing the test facility and some actual testing.

23601 (SR/H–523) **Power Department.** Hanford Engineer Works, Richland, WA (United States). [1946]. 189p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93012363. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Power Department is responsible for the operation of all steam and water facilities in the five production areas, as well as in the 300 Area and Richland. In the 100 Areas, this water responsibility extends into the Valve Pits of the Pile Buildings, and in the 200 Areas all air compressing, air conditioning, and ventilating facilities in the process buildings are operated by the Power Department. Richland resonsibilities include the sewage disposal plant. This memorandum reviews the functions and organization of the Power Department from its inception to July 1, 1945.

23602 (SR/H–536) **[Hanford Department Histories]: Instrument Department.** Plant Histories. Hanford Engineer Works, Richland, WA (United States). [1946]. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93013022. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The complexity, diversity, and unique character of instrumentation at Hanford combined to necessitate the inclusion of a separate Instrument Department in the plant organization. Considerable instrument fabrication work has been involved, in addition to the unusual maintenance volume attending such extensive use of instruments. The Department also has been responsible for instrument development since the Technical Department discontinued this work in March 1945. This memorandum reviews the functions and organization of the Instrument Department from its inception to July 1, 1945. Similar reviews of the Department's activities are being presented in separate memoranda.

23603 (SR/H–537) **[Hanford Department Histories]: Maintenance Department.** Plant Histories. Hoenie, P.A.; McMahon, J.S.; Eshelman, R.L.; Wangelin, R.S.; Dorsey, G.W. Jr.; Heffner, J.M.; Dean, E.O.; Smithson, J.H. Hanford Engineer Works, Richland, WA (United States). [1946]. 208p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93013023. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Maintenance Department is responsible for all maintenance and new work in connection with buildings, facilities and equipment in all six plant areas and Richland, with the following exceptions: (a) Electrical equipment such as motors, transformers, lines, etc. is a responsibility of the Electrical Department.(b) All maintenance and new work in connection with instruments is a function of the Instrument Department.(c) Automotive equipment, railroad equipment, tracks and roads are maintained by the Transportation Department.The Department's responsibility for nev work usually includes the designing involved, and a group of engineers and draftsmen are assigned to this phase of the work. Another Departmental function is to conduct methods studies for all departments, as required. This memorandum reviews the functions and rganization of the Maintenance Department from its inception to July 1, 1945.

23604 (SR/H–548) **[The Hanford story, Chapters 9–11].** [Plant Histories]. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. [1943]. 239p. This document provides Chapters 9, 10, and 11 of The Hanford Story. These chapters discuss Process Support, Materials Procurement and Processing, and Security. (FI)

23605 (WHC-EP–0619-Vol.2) **Risk management study for the retired Hanford Site facilities: Volume 2, Risk evaluation work procedure for the retired Hanford Site facilities.** Coles, G.A.; Shultz, M.V.; Taylor, W.E. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93013004. Source: OSTI; NTIS; INIS; GPO Dep.

Risk from retired surplus facilities has always been assumed to be low at the Hanford Site as the facilities are inactive and have few potentials for causing an offsite hazardous material release. However,the fatal accident that occurred in the spring of 1992 in which an employee fell through a deteriorated roof at the 105-F Reactor Building has raised the possibility that retired facilities represent a greater risk than was originally assumed. Therefore, Westinghouse Hanford Company and the US Department of Energy management have determined that facility risk management strategies and programmatic plans should be reevaluated to assure risks are identified and appropriate corrective action plans are developed. To evaluate risk management strategies, accurate risk information about the current and projected condition of the facilities must be developed. This work procedure has been created to address the development of accurate and timely risk information. By using the evaluation results in this procedure, it will be possible to create a prioritized baseline for managing facility risk until all retired surplus facilities are demolished.

23606 (WSRC-MS–92-167-Del.Ver.) **Enhancement of the source term algorithm for emergency response at the Savannah River Site.** Simpkins, A.A.; O'Kula, K.R.; Taylor, R.P.; Kearnaghan, G.P. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930402–5: 4. topical meeting on emergency preparedness and

response, Long Island, NY (United States), 25-29 Apr 1993). Order Number DE93012845. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this work is to use the results of the Savannah River Site K-Reactor Probabilistic Safety Assessment to determine the accident sequences and source terms for beyond design basis accidents. Additionally, the methodology necessary to allow the Reactor Accident Program to incorporate this information is to be discussed.

23607 (WSRC-MS–92-224) **Screening criteria for design basis events.** Paddleford, D.F.; Wooten, L.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930116–42: Probabilistic safety assessment international topical meeting (PSA 93), Clearwater Beach, FL (United States), 27-29 Jan 1993). Order Number DE93009875. Source: OSTI; NTIS; INIS; GPO Dep.

A risk based screening criteria was developed to assist in determining whether issues raised during K-reactor restart safety analyses needed to be part of the design basis, and if so, to guide the degree of conservatism in the analysis. This paper describes the development of this criterias existing precedents, and its implementation guidelines and restrictions.

23608 (WSRC-MS–92-362) **Flow regime mapping of vertical two-phase downflow in a ribbed annulus.** Kielpinski, A.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–1: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93004879. Source: OSTI; NTIS; INIS; GPO Dep.

Two-phase flow regimes have been mapped for vertical, cocurrent downflow in a narrow annulus which is partially segmented by the presence of longitudinal ribs. This geometry and flow condition has application to the analysis of a Large-Break Loss of Coolant Accident (LB-LOCA) in the production K-Reactor at the Savannah River Site (SRS). The ribbed annular geometry, particularly the presence of non-sealing ribs, gives rise to some unique phenomenological features. The flow behavior is influenced by the partial segmentation of the annulus into four quadrants or subchannels. A random element is induced by the natural bowing of the slender tubes; the width of the azimuthal flow path between two subchannels at a given axial location is indeterminate, and can take on any value between zero and the maximum clearance of 7.6×10^{-4} m. When the rib gap is zero at a given location, it is at a maximum 180P away at the same axial location. The range of rib gaps is spanned in a single test section, as it would be also in a reactor assembly. As a result of these effects, flow regime maps obtained by other researchers for downflow in annuli are not accurate for defining flow regimes in a ribbed annulus. Flow regime transitions similar to those noted by, e.g., Bamea, were observed; the locations of these transitions were displaced with respect to the transition equations derived by Bamea. Experimental bubble rise velocity measurements were also obtained in the same test section. The bubble rise velocities were much higher than expected from the theory developed for slug bubbles in tubes, unribbed annuli, and rectangular channels. An elliptical-cap bubble rises faster than a slug bubble of the same area. Large, slug-shaped bubbles injected into the test section were observed to reduce in size as they rose, due to interaction with a longitudinal rib. They thereby adopted a shape more like an elliptical-cap bubble, hence rising faster than the original slug bubble.

23609 (WSRC-MS–92-388) **Flow instability and flow reversal in heated annular multichannels with initial downward flow.** Guerrero, H.N.; Hart, C.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–2: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93006164. Source: OSTI; NTIS; GPO Dep.

Experimental and theoretical results are presented regarding the stability of initial downward flow of single phase water in parallel annular channels of the Savannah River Site (SRS) fuel assembly. The test was performed on an electrically heated prototypic mockup of a Mark-22 fuel assembly. The test conditions consisted of mass fluxes, from 98–294 kg/m^2-sec, and inlet water temperatures of 25°C and 40°C. With increased power to the heaters, flow instability was detected, characterized by flow fluctuations and flow redistribution among subchannels of the outer flow channel. With increased power, a condition was observed indicating local subchannel flow reversals where certain subchannel fluid temperatures were high at the inlet and low at the exit. With additional power increased, a critical heat flux condition was observed indicating local subchannel flow reversals where certain subchannel fluid temperatures were high at the inlet and low at the exit. With additional power increases, a critical heat flux condition was reached in the outer channel.

23610 (WSRC-MS–92-390) **Two-phase interfacial area and flow regime modeling in FLOWTRAN-TF code.** Smith, F.G. III; Lee, S.Y.; Flach, G.P.; Hamm, L.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–12: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93009874. Source: OSTI; NTIS; INIS; GPO Dep.

FLOWTRAN-TF is a new two-component, two-phase thermal-hydraulics code to capture the detailed assembly behavior associated with loss-of-coolant accident analyses in multichannel assemblies of the SRS reactors. The local interfacial area of the two-phase mixture is computed by summing the interfacial areas contributed by each of three flow regimes. For smooth flow regime transitions, the code uses an interpolation technique in terms of component void fraction for each basic flow regime.

23611 (WSRC-MS–92-441) **Reactor cooling water expansion joint bellows: The role of the seam weld in fatigue crack development.** West, S.L.; Nelson, D.Z.; Louthan, M.R. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930850–1: 25. annual meeting of the International Metallographic Society (IMS), Denver, CO (United States), 2-5 Aug 1993). Order Number DE93004298. Source: OSTI; NTIS; INIS; GPO Dep.

The secondary cooling water system pressure boundary of Savannah River Site reactors includes expansion joints utilizing a thin-wall bellows. While successfully used for over thirty years, an occasional replacement has been required because of the development of small, circumferential fatigue cracks in a bellows convolute. One such crack was recently shown to have initiated from a weld heat-affected zone liquation microcrack. The crack, initially open to the outer surface of the rolled and seam welded cylindrical bellows section, was closed when cold forming of the convolutes placed the outer surface in residual compression. However, the bellows was placed in tension when installed, and the tensile stresses reopened the microcrack. This five to eight grain diameter microcrack was extended by ductile fatigue processes. Initial extension was by relatively rapid propagation through the large-grained weld metal, followed by slower extension through the fine-grained base metal. A significant through-wall crack was not developed until the crack extended into the base metal on both sides of the weld. Leakage of cooling water was subsequently detected and the bellows removed and a replacement installed.

23612 (WSRC-MS–92-519) **SRS supplemental safety system injection (gas pressurizer) test.** Howarth, W.L.; Dimenna, R.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930778–1: 1993 RELAP5 international users meeting, Boston, MA (United States), 6-9 Jul 1993). Order Number DE93012820. Source: OSTI; NTIS; INIS; GPO Dep.

An evaluation and validation of an existing version of the RELAP5 thermal hydraulics computer code was undertaken for the purpose of certification for use in the new production reactor - heavy water reactor (NPR-HWR) program. This version of the code was RELAP5/MOD3 Version 5q, designated for the purposes of the NPR-HWR program as RELAP5/NPR Version 0. As part of the evaluation and assessment, test data from theSRS Supplemental Safety System Injection (Gas Pressurizer) was used to verify and

assess the ability of RELAP5/NPR Version 0 to perform thermal-hydraulic model analysis using the test data. Specifically, the assessment determines RELAP5/NPR Version 0 capability in modeling sudden depressurization phenomena. Two RELAP5/NPR Version 0 components (pipe and accumulator) were used to compare calculated pressure and temperature against test data. The code deficiencies are a temperature clamp in the accumulator component prevents the gas temperature from going below −9°F, and RELAP5 accumulator and pipe components wall-to-fluid heat transfer correlation and interfacial vapor heat transfer correlation need substantial improvement. Only the code pipe component calculated pressures and temperatures within the specified 10 percent accuracy.

23613 (WSRC-RP–92-1099) **Unseated septifoil non-detection probability.** Topp, S.V. Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014757. Source: OSTI; NTIS; INIS; GPO Dep.

The frequency that the Savannah River K-Reactor would proceed beyond hydraulic startup with a septifoil not properly seated is estimated in this report. It summarizes previous work on this subject, incorporates concerns about the utility of individual septifoil pressure measurements, and discusses two proposed techniques that could lower the non-detection probability to the point that this issue could be beyond Design Basis consideration.

23614 (WSRC-TR–92-12) **Structural integrity analysis of process water system Bingham pumps: Task Number: 91-086-1.** Gupta, N.K. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013687. Source: OSTI; NTIS; GPO Dep.

Bingham pumps comprise part of the pressure boundary of the Process Water System (PWS). Monitoring the pump casing through in-service inspection is important to demonstrate the structural integrity throughout service. An acceptance criteria methodology with technical bases is provided to disposition flaws detected during examination of the pump casing. The methodology ensures that the defined structural or safety margins against failure are maintained throughout pump service in full consideration of service-induced degradation. Acceptance criteria, defining the acceptable flaw (length and depth) configurations for the pump casing, are established through structural analyses of the casing and flaw stability analyses of postulated flaws. Three-dimensional shell element model of the complex-shaped casing is constructed and detailed finite element stress analyses are performed at normal and off-normal loading conditions. Safety factors are applied to the resultant stresses and flaws are postulated at the most highly stressed regions of the pump casing. Postulated throughwall flaws in simplified casing configurations are analyzed with linear elastic and limit load methods with conservative application of the stress results. The most limiting results from the flaw stability analyses define The acceptable flaw length of 3.5 inches for the casing. The pump suction cover was separately analyzed to study the bolt failure concerns. Analyses were performed considering all bolts intact, all bolts cracked (25% deep through minor diameter), and up to 8 bolts inactive. It is found that as many as 4 bolts could be completely broken without adversely impacting the pressure boundary of the pumps at the design and operating conditions. Therefore, the current practice of volumetric and surface examination of the suction cover bolts is sufficient for the continued safe operation of the pumps.

23615 (WSRC-TR–92-044) **Verification, validation, and benchmarking report for TRIMHX: A three dimensional hexagonal transient diffusion theory code.** Le, T.T. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1992. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014756. Source: OSTI; NTIS; INIS; GPO Dep.

TRIMHX is a fundamental Reactor Analysis tool in use at the Savannah River Site (SRS) and is an integral part of the Generalized Reactor Analysis Subsystem (GRASS). TRIMHX solves the time dependent multigroup neutron diffusion equation in two and three dimensional hexagonal geometry by standard and coarse mesh finite difference methods. The TRIMHX implementation assumes the solution to this equation can be discretized in space, energy, and time. These are industry accepted approaches which can be found in many nuclear engineering books. This report concerns the verification and validation of TRIMHX, a transient two and three dimensional hex-z diffusion theory code. The validation was performed to determine the accuracy of the code, and the verification was performed to determine if the code was correctly using the correct theory and that all the subroutines function as required. For TRIMHX, the validation requirement was satisfied by comparing the results of the code with experiments and benchmarking the code against other standard or validated code results. The verification requirement for TRIMHX was performed indirectly since it is impossible and not necessary to reverify a large code like TRIMHX line by line. The extensive operations history of TRIMHX in conjunction with the comparisons against many numerical experiments (exact solutions) and other diffusion theory codes is sufficient to establish that the code is functioning as intended and therefore it is verified. This report summarizes four sets of experiments performed in 1974, 1977, and 1988, two DIF3D/TRIMHX comparison problems performed in 1991, a DIF3D/FX2-TH/TRIMHX comparison problem produced for this report, and the comparison of TRIMHX/GRIMHX initial static calculations. The results of these experiments show that TRIMHX was correctly implemented and is ready to submit into SCMS production mode.

23616 (WSRC-TR–92-532) **FLOWTRAN-TF software design.** Aleman, S.E.; Flach, G.P.; Hamm, L.L.; Lee, S.Y.; Smith, F.G. III. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 597p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012824. Source: OSTI; NTIS; GPO Dep.

FLOWTRAN-TF was created to analyze an individual Mk22 fuel assembly during a large break Loss Of Coolant Accident (LOCA) scenario involving the Savannah River Site K-reactor after the initial few seconds of the transient. During the initial few seconds reactor cooling is limited by the static or Ledinegg flow instability phenomenon. The predecessor FLOWTRAN code was developed to analyze this portion of a LOCA. In the several seconds following the break, a significant fraction of the reactor coolant inventory leaks out the break, Emergency Cooling System (ECS) flow is initiated, and air enters the primary coolant circulation loops. Reactor fuel assemblies are cooled by a low flowrate air-water downflow. Existing commercial nuclear industry thermal-hydraulic codes were judged inadequate for detailed modeling of a Mk22 fuel assembly because the application involves a ribbed annular geometry, low pressure, downflow and an air-water mixture. FLOWTRAN-TF is a two-phase thermal-hydraulics code of similar technology to existing commercial codes such as RELAP and TRAC but customized for Savannah River Site applications. The main features and capabilities of FLOWTRAN-TF are detailed Mk22 fuel assembly ribbed annular geometry; conjugate heat transfer; detailed neutronic power distribution; three-dimensional heat conduction in Mk22 fuel and target tubes; two-dimensional coolant flow in channels (axial, azimuthal); single-phase and/or two-phase fluid (gas, liquid and/or gas-liquid); two-component (air, water); constitutive models applicable to low pressure air-water downflow in ribbed annular channels. The design of FLOWTRAN-TF is described in detail in this report which serves as the Software Design Report in accordance with Quality Assurance Procedure IV-4, Rev. 0 "Software Design and Implementation" in the 1Q34 manual.

23617 (WSRC-TR–93-002) **Wall thinning criteria for low temperature-low pressure piping: Task 91-030-1.** Mertz, G.E. Westinghouse Savannah River Co., Aiken, SC (United States). Jan 1993. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (SRT-MTS–92-1241). Order Number DE93013694. Source: OSTI; NTIS; GPO Dep.

This acceptance criteria is intended to prevent gross rupture or rapidly propagating failure during normal and abnormal operating conditions. Pitting may be present in the carbon steel piping. While the acceptance criteria have provisions to preclude gross rupture through a pitted region, they do not protect against throughwall pit growth and subsequent leakage. Potential leakage through a pit in

low pressure piping is less than the post-DBE design basis leakage. Both the uniform thinning and LTA criteria protect against leakage, since their potential for leakage is larger. The acceptance criteria protects against gross rupture due to general wall thinning, local wall thinning (LTA's), pitting, and fracture through weld defects. General wall thinning calculations are based on the restart criteria, SEP-24. LTA criteria for hoop stresses are based on ASME Code Case N-480 "Examination Requirements for Pipe Wall Thinning Due to Single Phase Erosion and Corrosion". The LTA criteria for axial stress is based on an effective average thickness concept, which prevents plastic collapse of a locally thinned pipe. Limits on pit density, based on an effective cross section concept, are used to prevent gross rupture through a group of pits. The CEGB R-6 failure assessment diagram is used in the fracture evaluation, along with postulated weld defects. This criteria is intended for low temperature, low pressure piping systems. Corrosion and/or weld defects increase the peak stresses during normal operation and may lead to a reduction in fatigue life. Piping systems subject to significant thermal or mechanical fatigue will require additional analysis which is beyond the scope of this document.

23618 (ANL/NPR–91/2-Vol.1) **Shake table tests of long period isolation system for nuclear facilities at soft-soil sites: Volume 1: New Production Reactors Program.** Kelly, J.M. (California Univ., Berkeley, CA (United States). Earthquake Engineering Research Center). Argonne National Lab., IL (United States). Mar 1991. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011655. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report describes the results of a test program of shake table studies for the purpose of assessing the safety of the base isolation design for the Heavy Water Reactor/New Production Reactor (HWR/NPR). The study was carried out on the 6 m x 6 m shake table at the Earthquake Simulator Laboratory of the Earthquake Engineering Research Center (EERC) of the University of California at Berkeley. For this test program, a number of site specific ground motion time histories were developed. These incorporated the effects of the soil profile, the site frequency, the degree of embedment of the structure and the anticipated soil-structure interaction of the isolated structure. The model used represented overall inertial properties of the structure at a scale factor of six. Two isolation systems were used, each based on multilayer natural rubber bearings. One system used a high damping rubber with similar properties to one widely used for civil structures in California. The other system used a newly developed high damping compound with a low shear modulus, which provides a frequency of about twenty-five percent lower than the first system. The test program thus allowed the assessment of long period isolation systems with long period ground motion and the degree to which the isolation system produced structural responses advantageous for equipment and piping design.

23619 (ANL/NPR–92/5) **Molten fuel fragmentation experiments: Stage 1: New Production Reactors Program.** Gabor, J.D.; Purviance, R.T.; Cassulo, J.C.; Spencer, B.W. Argonne National Lab., IL (United States). Sep 1991. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011351. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses a series of seven real-material experiments which has been completed examining the interaction between molten HWR-NPR core materials and water under postulated HWR-NPR core melt accident conditions. The work was conducted at essentially full scale, and depicts the stage of a postulated, protected accident when molten core materials relocate downward from a melting fuel assembly into the inlet region of the assembly and into an open, water-filled lower plenum below the assemblies. The objectives of the investigations were to provide a database on melt fragmentation, quenching, and debris characterization for THIRMAL code validation using HWR-NPR accident conditions and materials, and moreover, to explore the possibilities of a steam explosion as well as the extent of chemical reactions under these (untriggered) in-vessel melt-water interaction conditions.

23620 (ANL/NPR–92/15) **Transient analysis of dissolution of a reactor bottom head into a melt pool.** Tan, M.J. (Argonne National Lab., IL (United States)); Cho, D.H.; Cheung, F.B. Argonne National Lab., IL (United States). Sep 1992. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93010624. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The dissolution of the bottom head of a heavy water reactor into a pool of molten fuel under conditions of severe accidents is investigated. The main objectives are to determine the rate of dissolution-front propagation and to estimate the extent to which the bottom head is thinned owing to dissolution. A distributed parameter model is developed that extends the lumped-parameter model developed previously for transient analysis of dissolution of the interior surface of a reactor bottom head into a pool of molten aluminum. The extension takes into account both the variation of heat fluxes over the melt pool-bottom head interface and the variations of interface mass transfer with time and with position along the interface. The model consists mainly of partitioning the bottom head into a number of rings and analyzing the transient dissolution of each ring with a lumped-parameter model. For each of the rings, the dissolution is modeled using a mass transfer coefficient, the temperature distribution is considered to be one-dimensional and quasi-steady and the heat flux across the melt-bottom bead interface is modeled using a heat transfer coefficient. The distribution of the heat transfer coefficients is considered to be quasi-steady and is based on the scoping heat transfer calculation results obtained using the ACCORD code. The basic equations and their solution method for the distributed-parameter model are described. Comparisons of results from calculations using parameters pertaining to the reactor vessel in the original EBASCO full-size-plant design with those obtained previously using the lumped-parameter model are presented.

23621 (ANL/RE/CP–78569) **Numerical predictions of natural convection in a uniformly heated pool.** Tzanos, C.P. Cho, D.H. Argonne National Lab., IL (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930601–17: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93012888. Source: OSTI; NTIS; INIS; GPO Dep.

In the event of a core meltdown accident, one of the accident progression paths is fuel relocation to the lower reactor plenum. In the heavy water new production reactor (NPR-HWR) design the reactor cavity is flooded with water. In such a design, decay heat removal to the water in the reactor cavity and thence to the containment may be adequate to keep the reactor vessel temperature below failure limits. If this is the case, the accident progression can be arrested by retaining a coolable corium configuration in the lower reactor plenum. The strategy of reactor cavity flooding to prevent reactor vessel failure from molten corium relocation to the reactor vessel lower head has also been considered for commercial pressurized water reactors. Previously, the computer code COMMIX-LAR/P was used to determine if the heat removal rate from the molten cerium in the lower plenum to the water in the cavity was adequate to keep the reactor vessel temperature in the NPR-HWR design below failure limits. It was found that natural convection in the molten pool resulted in heat removal rates that kept the peak reactor vessel temperature about 400°C below the steel melting point. The objective of the work presented in this paper was to determine whether COMMIX adequately predicts natural convection in a pool heated by a uniform heat source. For this purpose, the experiments of free convection in a semicircular cavity of Jahn and Reeneke were analyzed with COMMIX and code predictions were compared with experimental measurements. COMMIX is a general purpose thermalhydraulics code based on finite differencing by the first order upwind scheme.

23622 (BF-R–40.050-1) **Studies into primary gas releases into the reactor building of modular HTR. Project task: Computation of specific pathways. Final report.** Schimetschka, E.

Battelle-Institut e.V., Frankfurt am Main (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Feb 1992. 18p. (In German). Contract BMFT 03BTI2022. Order Number DE93792313. Source: OSTI; NTIS (US Sales Only); INIS.

Based on the current design status of the planned modular HTGR plant type 'HTR-2M', accident sequences involving spontaneous releases of gas or steam into the reactor building are analyzed. These analyses from the base upon which judgement is possible whether or not plant personnel is endangered by such accidents. This projet is a part of a larger undertaking aiming to reduce potential hazards to plant personnel, even in case of accident. (orig.).

23623 (BF-R--40.050-2) **Studies into primary gas releases into the reactor building of modular HTR. Project task: Computation of specific pathways. Summary report on the basic model of the case of a 'break of the external pressure equalizer line'.** Holzbauer, H.; Schimetschka, E. Battelle-Institut e.V., Frankfurt am Main (Germany). Dec 1991. 50p. (In German). Order Number DE93792314. Source: OSTI; NTIS (US Sales Only); INIS.

Based on the current design status of the planned modular HTGR plant type 'HTR-2M', calculations regarding conditions inside the reactor building after postulated break of the external pressure equalizer line are presented. The calculations are focused on gas distribution, local temperatures and aerosol behavior. The calculations are to quantify plant- internal effects expected from defined accident sequences for the current plant design. Against this baseline, improvements due to design improvements are to be compared in future. (orig.).

23624 (BF-R--40.050-3) **Studies into primary gas releases into the reactor building of modular HTR. Project task: Computation of specific pathways. Summary report on the basic model of the case of a 'main stream line break'.** Holzbauer, H.; Schimetschka, E. Battelle-Institut e.V., Frankfurt am Main (Germany). Jan 1992. 46p. (In German). Order Number DE93792315. Source: OSTI; NTIS (US Sales Only); INIS.

Based on the current design status of the planned modular HTGR plant type 'HTR- 2M', calculations regarding conditions inside the reactor building after postulated main steam line break upstream of the first isolation valve are presented. The calculations are focused on steam distribution and local heat loads. The calculations are to quantify plant-internal effects expected from defined accident sequences for the current plant design. Against this baseline, improvements due to design optimisation are to be compared in future. (orig.).

23625 (BNL-NUREG--47817) **Identification of important "PIUS" design considerations and accident sequences using qualitative plant assessment techniques.** Higgins, J.; Fullwood, R.; Kroeger, P.; Youngblood, R. Brookhaven National Lab., Upton, NY (United States). [1992]. 11p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921007--22: 20. water reactor safety information meeting, Bethesda, MD (United States), 21-23 Oct 1992). Order Number DE93009326. Source: OSTI; NTIS; INIS; GPO Dep.

The PIUS (Process Inherent Ultimate Safety) reactor is an advanced design nuclear power plant that uses passive safety features and basic physical processes to address safety concerns. Brookhaven National Laboratory (BNL) performed a detailed study of the PIUS design for the NRC using primarily qualitative engineering analysis techniques. Some quantitative methods were also employed. There are three key initial areas of analysis: FMECA, HAZOP, and deterministic analyses, which are described herein. Once these three analysis methods were completed, the important findings from each of the methods were assembled into thePIUS Interim Table (PIT). This table thus contains a first cut sort of the important design considerations and features of the PIUS reactor. The table also identifies some potential initiating events and systems used for mitigating these initiators. The next stage of the analysis was the construction of event trees for each of the identified initiators. The most significant sequences were then determined qualitatively, using, some quantitative input. Finally, overall insights on the PIUS design developed from the PIT and from the event tree analysis were developed and presented.

23626 (BNL-NUREG--47971) **Level 1 probabilistic risk assessment of low power and shutdown operations at a PWR: Phase 2 results.** Chu, T.L. (Brookhaven National Lab., Upton, NY (United States)); Bozoki, G.; Kohut, P.; Musicki, Z.; Wong, S.M.; Yang, J.; Hsu, C.J.; Diamond, D.J.; Su, R.F.; Holmes, B.; Siu, N.; Bley, D.; Lin, J. Brookhaven National Lab., Upton, NY (United States). [1992]. 10p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921007--27: 20. water reactor safety information meeting, Bethesda, MD (United States), 21-23 Oct 1992). Order Number DE93010937. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of the Chernobyl accident and other precursor events (e.g., Diablo Canyon), the US Nuclear Regulatory Commission's (NRC's) Office of Nuclear Regulatory Research (RES) initiated an extensive project during 1989 to carefully examine the potential risks during Low Power and Shutdown (LP&S) operations. Shortly after the program began, an event occurred at the Vogtle plant during shutdown, which further intensified the effort of the LP&S program. In the LP&S program, one pressurized water reactor (PWR), Surry, and one boiling water reactor (BWR), Grand Gulf, were selected, mainly because they were previously analyzed in the NUREG-1150 Study. The Level-1 Program is being performed in two phases. Phase 1 was dedicated to performing a coarse screening level-1 analysis including internal fire and flood. A draft report was completed in November, 1991. In the phase 2 study, mid-loop operations at the Surry plant were analyzed in detail. The objective of this paper is to present the approach of the phase 2 study and the preliminary results and insights.

23627 (BNL-NUREG--48542) **MELCOR Verification, Benchmarking, and Applications experience at BNL.** Madni, I.K. Brookhaven National Lab., Upton, NY (United States). [1992]. 17p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921007--21: 20. water reactor safety information meeting, Bethesda, MD (United States), 21-23 Oct 1992). Order Number DE93009331. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a summary of MELCOR Verification, Benchmarking and Applications experience at Brookhaven National Laboratory (BNL), sponsored by the US Nuclear Regulatory Commission (NRC). Under MELCOR verification over the past several years, all released versions of the code were installed on BNL's computer system, verification exercises were performed, and defect investigation reports were sent to SNL. Benchmarking calculations of integral severe fuel damage tests performed at BNL have helped to identify areas of modeling strengths and weaknesses in MELCOR; the most appropriate choices for input parameters; selection of axial nodalization for core cells and heat structures; and workarounds that extend the capabilities of MELCOR. These insights are explored in greater detail in the paper, with the help of selected results and comparisons. Full plant applications calculations at BNL have helped to evaluate the ability of MELCOR to successfully simulate various accident sequences and calculate source terms to the environment for both BWRs and PWRs. A summary of results, including timing of key events, thermal-hydraulic response, and environmental releases of fission products are presented for selected calculations, along with comparisons with Source Term Code Package (STCP) calculations of the same sequences. Differences in results are explained on the basis of modeling differences between the two codes. The results of a sensitivity calculation are also shown. The paper concludes by highlighting some insights on bottomline issues, and the contribution of the BNL program to MELCOR development, assessment, and the identification of user needs for optimum use of the code.

23628 (BNL-NUREG--48687) **Development of a methodology for conducting an integrated HRA/PRA, Task 1: An assessment of human reliability influences during LP&S conditions in PWRs.** Luckas, W.J. (Brookhaven National Lab., Upton, NY (United States)); Barriere, M.T.; Brown, W.S.; Wreathall, J.; Cooper, S.E. Brookhaven National Lab., Upton, NY (United States). [1992]. 24p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921007--28: 20. water reactor safety information meeting,

Bethesda, MD (United States), 21-23 Oct 1992). Order Number DE93014286. Source: OSTI; NTIS; INIS; GPO Dep.

During Low Power and Shutdown (LP&S) conditions in a nuclear power plant (i.e., when the reactor is subcritical or at less than 10–15% power), human interactions with the plant's systems will be more frequent and more direct. Control is typically not mediated by automation, and there are fewer protective systems available. Therefore, an assessment of LP&S related risk should include a greater emphasis on human reliability than such an assessment made for power operation conditions. In order to properly account for the increase in human interaction and thus be able to perform a probabilistic risk assessment (PRA) applicable to operations during LP&S, it is important that a comprehensive human reliability assessment (HRA) methodology be developed and integrated into the LP&S PRA. The tasks comprising the comprehensive HRA methodology development are as follows: (1) identification of the human reliability related influences and associated human actions during LP&S, (2) identification of potentially important LP&S related human actions and appropriate HRA framework and quantification methods, and (3) incorporation and coordination of methodology development with other integrated PRA/HRA efforts. This paper describes the first task, i.e., the assessment of human reliability influences and any associated human actions during LP&S conditions for a pressurized water reactor (PWR).

23629 (CONF-930803–10) **Warm prestress effects in fracture-margin assessment of PWR-RPVs.** Shum, D.K.M. Oak Ridge National Lab., TN (United States). [1993]. 6p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology; Stuttgart (Germany); 16-20 Aug 1993. Order Number DE93013511. Source: OSTI; NTIS; INIS; GPO Dep.

This paper examines various issues that would impact the incorporation of warm prestress (WPS) effects in the fracture-margin assessment of reactor pressure vessels (RPVs). By way of an example problem, possible beneficial effects of including type-I WPS in the assessment of an RPV subjected to a small break loss of coolant accident are described. In addition, the need to consider possible loss of constraint effects when interpreting available small specimen WPS-enhanced fracture toughness data is demonstrated through two- and three-dimensional local crack-lip field analyses of a compact tension specimen. Finally, a hybrid correlative-predictive model of WPS base on J-Q theory and the Ritchie-Knott-Rice model is applied to a small scale yielding boundary layer formulation to investigate near crack-tip fields under varying degrees of loading and unloading.

23630 (CONF-930830–7) **Accurate representation of primary coolant system depressurization for high flux isotope reactor transients.** Wendel, M.W. Oak Ridge National Lab., TN (United States). [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From National conference and exposition on heat transfer; Atlanta, GA (United States); 8-11 Aug 1993. Order Number DE93008267. Source: OSTI; NTIS; INIS; GPO Dep.

Because the High Flux Isotope Reactor primary coolant system is typically all liquid, the pressure falls very rapidly if a leak forms in the primary piping. This depressurization is the predominate phenomenon in the consideration of the loss-of-coolant-accident analysis that has been completed recently for the High Flux Isotope Reactor Safety Analysis Report. Small differences in the rate of depressurization can significantly affect the safety margin. A RELAP5 thermal-hydraulic input model has been developed, but the capabilities of the RELAP5 code do not automatically take into account the effect on the system pressure of a stretching or shrinkage in the pressure boundary. Because this change in the pressure boundary is so important in an all-liquid system, a scheme has been developed to account for the effect implementation of the structural elasticity model involved using the control variable capability of RELAP5. During simulated transients involving rapid pressure changes, mass is added to or taken away from the primary system depending on whether the system is decreasing or increasing in pressure. By doing so, a more realistic system response to transients involving significant pressure changes is obtained. The model has been used to perform various HFIR transient simulations including loss-of-coolant accidents (LOCAs), loss of offsite power, and loss-of-secondary-cooling transients. Results for a small break LOCA are presented with and without the elasticity model in place.

23631 (CONF-930830–19) **Analysis and modeling of flow blockage-induced steam explosion events in the High-Flux Isotope Reactor.** Taleyarkhan, R.P.; Georgevich, V.; Lestor, C.W.; Gat, U.; Lepard, B.L.; Cook, D.H.; Freels, J.; Chang, S.J.; Luttrell, C.; Gwaltney, R.C.; Kirkpatrick, J. Oak Ridge National Lab., TN (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From National conference and exposition on heat transfer; Atlanta, GA (United States); 8-11 Aug 1993. Order Number DE93013531. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides a perspective overview of the analysis and modeling work done to evaluate the threat from steam explosion loads in the High-Flux Isotope Reactor during flow blockage events. The overall workscope included modeling and analysis of core melt initiation, melt propagation, bounding and best-estimate steam explosion energetics, vessel failure from fracture, bolts failure from exceedance of elastic limits, and finally, missile evolution and transport. Aluminum ignition was neglected. Evaluations indicated that a thermally driven steam explosion with more than 65 MJ of energy insertion in the core region over several miliseconds would be needed to cause a sufficiently energetic missile with a capacity to cause early confinement failure. This amounts to about 65% of the HFIR core mass melting and participating in a steam explosion. Conservative melt propagation analyses have indicated that at most only 24% of the HFIR core mass could melt during flow blockage events under full-power conditions. Therefore, it is judged that the HFIR vessel and top head structure will be able to withstand loads generated from thermally driven steam explosions initiated by any credible flow blockage event. A substantial margin to safety was demonstrated.

23632 (EGG–2683) **Final report of the decontamination and decommissioning of the BORAX-V facility turbine building.** Arave, A.E.; Rodman, G.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Dec 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012142. Source: OSTI; NTIS; INIS; GPO Dep.

The Boiling Water Reactor Experiment (BORAX)-V Facility Turbine Building Decontamination and Decommissioning (D&D) Project is described in this report. The BORAX series of five National Reactor Testing Station (NRTS) reactors pioneered intensive work on boiling water reactor (BWR) experiments conducted between 1953 and 1964. Facility characterization, decision analyses, and D&D plans for the turbine building were prepared from 1979 through 1990. D&D activities of the turbine building systems were initiated in November of 1988 and completed with the demolition and backfill of the concrete foundation in March 1992. Due to the low levels of radioactivity and the absence of loose contamination, the D&D activities were completed with no radiation exposure to the workers. The D&D activities were performed in a manner that no radiological health or safety hazard to the public or to personnel at the Idaho National Engineering Laboratory (INEL) remain.

23633 (EGG-GEO–10304-Vol.2) **Earthquake ground motion evaluations for the proposed new production reactor at the Idaho National Engineering Laboratory: Volume 2, Probabilistic evaluation.** Coppersmith, K. (Woodward-Clyde Consultants, Oakland, CA (United States)); Wong, I.; Silva, W.; Hemphill-Haley, M.; Sawyer, T.; Youngs, R.; Stark, C.; Knuepfer, P.; Bruhn, R. EG and G Idaho, Inc., Idaho Falls, ID (United States); Woodward-Clyde Consultants, Oakland, CA (United States); Geomatrix Consultants, Inc., San Francisco, CA (United States); Pacific Engineering and Analysis, Inc., El Cerrito, CA (United States). Jun 1992. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012264. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This volume describes and summarizes a probabilistic evaluation of ground motions for the proposed New Production Reactor (NPR) at the Idaho National Engineering Laboratory (INEL). The purpose of this evaluation is to provide input to Section 2.5.2 "Vibratory Ground Motion" of the INEL-NPR Integrated Safety Analysis Report

(ISAR). These probabilistic ground motion studies serve as a basis for evaluating the probability of exceeding the deterministic ground motion values determined for the NPR site.

23634 (EGG-M–92266) **Firewater system inadvertent actuation frequencies.** Schroeder, J.A. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Eide, S.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930116–43: Probabilistic safety assessment international topical meeting (PSA 93), Clearwater Beach, FL (United States), 27-29 Jan 1993). Order Number DE93010801. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents some recommended generic values for fire protection system inadvertent actuation frequencies. The frequencies are based on actual data from Department of Energy and commercial reactor plant facilities.

23635 (EGG-M–92466) **Lessons learned from pilot errors using automated systems in advanced technology aircraft.** Nelson, W.R.; Byers, J.C.; Haney, L.N.; Ostrom, L.T.; Reece, W.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 6p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930401–13: Meeting on nuclear plant instrumentation, control and man-machine interface technologies, Oak Ridge, TN (United States), 18-21 Apr 1993). Order Number DE93010788. Source: OSTI; NTIS; GPO Dep.

The National Aeronautics and Space Administration (NASA) sponsored a project at the Idaho National Engineering Laboratory (INEL) to investigate pilot errors that occur during interaction with automated systems in advanced technology ("glass cockpit") aircraft. In particular, we investigated the causes and potential corrective measures for pilot errors that resulted in altitude deviation incidents (i.e. failure to capture or maintain the altitude assigned by air traffic control). To do this, we analyzed altitude deviation events that have been reported in the Aviation Safety Reporting System (ASRS), NASA's data base of incidents self-reported by pilots and air traffic controllers. We developed models of the pilot tasks that are performed to capture and maintain altitude. Two types of models were developed to provide complementary perspectives of these tasks: sequential models and functional models. Both types of models show the errors that occur in actual altitude deviation events in advanced technology aircraft. Then, errors from the ASRS data base were categorized according to the models, to help understand the potential causes of the different error types. This paper summarizes the methodology used to analyze pilot errors, the lessons learned from the study of altitude deviation errors, and the application of these results for the introduction of advanced technology in nuclear power plants.

23636 (EGG-M–92569) **Design, quallfication and operation of nuclear rockets for safe Mars missions.** Buden, D. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Madsen, W.W.; Olson, T.S.; Redd, L.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930103–31: 10. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 10-14 Jan 1993). Order Number DE93010792. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear thermal propulsion modules planned for use on crew missions to Mars improve mission reliability and overall safety of the mission. This, as well as all other systems, are greatly enhanced if the system specifications take into account safety from design initiation, and operational considerations are well thought through and applied. For instance, the use of multiple engines in the propulsion module can lead to very high system safety and reliability. Operational safety enhancements may include: the use of multiple perigee burns, thus allowing time to ensure that all systems are functioning properly prior to departure from Earth orbit; the ability to perform all other parts of the mission in a degraded mode with little or no degradation of the mission; and the safe disposal of the nuclear propulsion module in a heliocentric orbit out of the ecliptic plane. The standards used to qualify nuclear rockets are one of the main cost drivers of the program. Concepts and systems that minimize cost and risk will rely on use of the element and component levels to demonstrate technology readiness and validation. Subsystem or systems testing then is only needed for verification of performance. Also, these will be the safest concepts because they will be more thoroughly understood and the safety margins will be well established and confirmed by tests.

23637 (HW–79228) **Nuclear safety criteria for special test loads – N-Reactor.** Nechodom, W.S.; Miller, N.R. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 14 Oct 1963. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012369. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The initial fuel landing for the N-Reactor and the use of a specific alternative fuel element are described in a previous report. It is highly probable that it will also be desirable in the future to irradiate still other types of fuel elements in the reactor. If the test is of small scale, fever than five channels, or if these elements vary only slightly from the initial fuel load (or any other fuel type approved for large-scale use at some future date), the irradiation will be accomplished within the normal administrative procedures and controls established for the Production Testing Program. In this context, in-reactor testing of minor changes in the fuel cladding alloy, alternate methods of affixing end closures, different fuel support designs or similar changes are considered to be within the scope of normal productiontesting. It is possible, however, that it will be desirable to irradiate test fuel elements which are significantly different from any element approved for general use and in quantities of greater than five fuel columns at a given time. A more formalized review of such tests including approval by the AEC would appear appropriate in these instances. The purpose of this document is to outline criteria which can be usedto judge the stability of all such tests from the standpoint of reactor nuclear safety. It is intended that these criteria apply to test fuel loadings comprising up to 50 fuel columns within the reactor at a given time.

23638 (INIS-mf–13502) **Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.** European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. [235p.] (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The proceedings contain 23 invited plenary session papers. All have been inputted to INIS. The topics covered include safety principles, management and organization, operational training and simulation, inspection, maintenance and component replacement, backfitting experience, instrumentation, man-machine interface, software and procedures. (Z.S.).

European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. I: Invited plenary session papers.* [235p.] Order Number DE93626240. Source: OSTI; NTIS (US Sales Only); INIS.

The achievement of world nuclear safety standards is interpreted as the achievement of high and reasonably uniform levels of safety throughout the world. The basic and principal elements of such an international nuclear safety regime are discussed against the background of the ongoing work on an international nuclear safety convention. Such principal elements include the national legal and institutional framework, the fundamental safety principles and, of particular importance, the mechanisms for demonstration of safety and compliance with an international safety regime seen as national obligations under an international safety convention. (author) 7 refs.

23640 (INIS-mf–14146) **Hochtemperatur-Kernkraftwerk GmbH (HKG). Annual report 1992.** Hochtemperatur-Kernkraftwerk GmbH (HKG), Hamm (Germany). 1993. 25p. (In German). Order Number DE93795324. Source: OSTI; NTIS (US Sales Only); INIS.

The report summarizes the business year and the current state of activities concerning shutdown operation, spent fuel management and the licensing procedure in progress. In depth information is given on the financial and business management aspects, as e.g. profit and loss account, methods applied for valuation and preparation of the balance sheet, and liabilities. (orig.).

23641 (JAERI-M–93-005) **Experimental study on a simulated primary-pipe rupture accident of HTGR: Experimental results of air ingress behavior.** Takeda, Tetsuaki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Takenaka, Satsuki; Hishida, Makoto; Emori, Koichi; Agake, Takashi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 58p. (In Japanese). Order Number DE93797569. Source: OSTI; NTIS; INIS.

In order to investigate the air ingress process following a primary coolant pipe of the HTGR ruptures, we constructed an experimental apparatus simulating the reactor and the primary cooling system. A test model consists of a reactor core simulator, a top cover, a water cooled vessel, a coaxial pipe and so on. The reactor core simulator has four graphite pipes and a ceramic high-temperature plenum. The graphite pipes are heated by electric heaters up to 1200degC. The major results obtained in the present study are summarized in the followings: (1) During the early stage of the simulated pipe rupture in the present apparatus, air entered the test model by molecular diffusion and very weak natural convection of the gas mixture. After the density of the gas mixture in the test model gradually increased, the natural circulation of air was induced in the whole test model abruptly. The gases, carbon monoxide and carbon dioxide, generated by the oxidation reactions were transported by the molecular diffusion and by the very weak natural convection of the gas mixture during the early stage of this experiment. (2) In case of temperature (more than 900degC), the amount of carbon monoxide produced increased with increasing of the graphite temperature. The carbon monoxide reacted with oxygen (carbon monoxide combustion) in the high temperature regions remarkably and produced carbon dioxide. (3) The duration of the early stage, was about several days. (J.P.N.).

23642 (JAERI-M–93-015) **Safety analyses of a high conversion LWR with BWR type tight lattice core.** Okubo, Tsutomu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Osugi, Toshitaka; Tomiai, Ichio. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 83p. (In Japanese). Order Number DE93797570. Source: OSTI; NTIS; INIS.

Although a high conversion LWR with a BWR type tight lattice core is an attractive reactor type due to its high conversion ratio of over 1.0 when we consider its effect on future reactor introduction, there would be some issues to be resolved, especially in the field of core cooling characteristics, due to its higher degree of tightness than ever. Therefore, as a part of the investigation on core cooling characteristics of this reactor, safety analyses on the critical heat flux characteristics under the steady state and the representative LOCA events of the high pressure core flooder piping break accident and the feed water piping break accident have been performed. Evaluation of the critical heat flux under the steady state has been performed with the KfK correlation. The results are severe ones from the thermodynamic point of view. They, however, show the minimum critical heat flux ratio of about 1.3 can be attained for the rod with the local power ratio of 1.2 and facing a subchannel surrounded by three of this type of rod in the fuel assembly with the power ratio of 1.3 by increasing the water flow rate by 20 percent in the high power fuel assembly than the average. Analyzed results with RETRAN code for those two LOCAs have shown the core is kept sufficiently cooled without any problems. The maximum core temperature calculated for a rod with the local power ratio of 1.2 in the fuel assembly with the power ratio of 1.3 in the high pressure core flooder piping break accident, which has given the severe results than the other, is around 670degC just after the accident initiation. Then, after 20 s, the core temperature is kept under about 300degC. (author).

23643 (JAERI-M–93-039) **Analysis of ROSA-IV/LSTF experiment simulating a steam generator tube rupture design basis incident by using RELAP5/MOD2 code.** Watanabe, Tadashi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kukita, Yutaka; Wang, Ming. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 33p. (In Japanese). Order Number DE93797602. Source: OSTI; NTIS; INIS.

The experiment (Run SB-SG-07), which simulated the design-basis steam generator tube rupture (SGTR) scenario for a pressurized water reactor (PWR), was conducted at the ROSA-IV/LSTF. The analysis of this experiment was performed by using the RELAP5/MOD2 code, and the predictive capability of the code for the characteristic phenomena in SGTR incidents was assessed against experimental data. This experiment and the analysis were performed after the experiment simulating the Mihama Unit-2 SGTR incident (Run SB-SG-06) and its analysis. The analytical results predicted well the behavior of major parameters in the experiment. However, in details, the following differences between the experiment and the analysis were found. The break flow rate was slightly overestimated immediately after the break. This was related to the experimental uncertainty in the initial fluid temperature in the break line. The increase in pressurizer water level was underestimated during the depressurization of primary side by opening the pressurizer power operated relief valve (PORV). The primary pressure was overestimated after the closing of the PORV. The secondary side liquid levels were overestimated in both the SGs, as was the case with the SB-SG-06 analysis. In the analysis, the decrease in the upper head fluid temperature was almost the same as that in the former experiment, but larger than that in this experiment. From the SB-SG-06 and SB-SG-07 analyses, several problems were found in the SGTR analysis by using RELAP5/MOD2 such as (1) the criterion for the horizontal stratification, and (2) the interfacial heat transfer model in the vertical stratification model. (author).

23644 (LA–12481) **SCDAP/RELAP5 independent peer review.** Corradini, M.L. (Wisconsin Univ., Madison, WI (United States). Dept. of Nuclear Engineering); Dhir, V.K.; Haste, T.J.; Heames, T.J.; Jenks, R.P.; Kelly, J.E.; Khatib-Rahbar, M. Los Alamos National Lab., NM (United States). Jan 1993. 357p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011569. Source: OSTI; NTIS; INIS; GPO Dep.

The SCDAP/RELAP5 code has been developed for best-estimate transient simulation of light-water-reactor coolant systems during severe accidents. The newest version of the code is SCDAP/RELAP5/MOD3. The US Nuclear Regulatory Commission (NRC) decided that there was a need for a broad technical review of the code by recognized experts to determine overall technical adequacy, even though the code is still under development. For this purpose, an eight-member SCDAP/RELAP5 Peer Review Committee was organized, and the outcome of the review should help the NRC prioritize future code-development activity. Because the code is designed to be mechanistic, the Committee used a higher standard for technical adequacy than was employed in the peer review of the parametric MELCOR code. The Committee completed its review of the SCDAP/RELAP5 code, and the findings are documented in this report. Based on these findings, recommendations in five areas are provided: (1) phenomenological models, (2) code-design objectives, (3) code-targeted applications, (4) other findings, and (5) additional recommendations.

23645 (LA-UR–92-3503) **Natural-circulation flow pattern during the gamma-heating phase of an LBLOCA in a heavy-water moderated reactor.** Rodriguez, S.B.; Unal, C.; Pasamehmetoglu, K.O.; Motley, F.E. Los Alamos National Lab., NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930352–17: 2. international conference on nuclear engineering, San Francisco, CA (United States), 21-24 Mar 1993). Order Number DE93012447. Source: OSTI; NTIS; INIS; GPO Dep.

In a postulated large-break loss-of-coolant accident (LBLOCA), the core of the reactor is uncovered quickly as the liquid that drains out of the tank is replaced by air. During the LBLOCA, the reactor is scrammed. the moderator tank is drained, and fuel and control rod tubes are cooled internally by forced convection via the emergency cooling system (ECS) water. However, the safety rods, reflector assemblies, tank wall, and instrument rods continue to heat up as a result of gamma deposition. These components are primarily cooled by natural/mixed convection and radiation heat

transfer. In this paper, the thermal-hydraulic analysis of a reactor moderator tank exposed to air during an LBLOCA is discussed. The analysis was performed using a special version of the Transient Reactor Analysis Code (TRAC). TRAC input and code modifications considered the appropriate modeling of ECS cooling, thermal radiation heat transfer, and natural convection. The major objective of the model was to calculate the limiting component temperature (that establishes the maximum operating power) as a result of gamma heating. In addition, the nature of the moderator tank air-circulation pattern and its effects on the limiting temperature under various conditions were analyzed. None of the components were found to exceed their structural limits when the pre-scram power level was 50% of historical power.

23646 (LA-UR–93-268) **Simplified dynamic buckling assessment of steel containments.** Farrar, C.R.; Duffey, T.A.; Renick, D.H. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930803–2: 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology, Stuttgart (Germany), 16-20 Aug 1993). Order Number DE93007373. Source: OSTI; NTIS; INIS; GPO Dep.

A simplified, three-degree-of-freedom analytical procedure for performing a response spectrum buckling analysis of a thin containment shell is developed. Two numerical examples with R/t values which bound many existing steel containments are used to illustrate the procedure. The role of damping on incipient buckling acceleration level is evaluated for a regulatory seismic spectrum using the two numerical examples. The zero-period acceleration level that causes incipient buckling in either of the two containments increases 31% when damping is increased from 1% to 4% of critical. Comparisons with finite element results on incipient buckling levels are favorable.

23647 (LA-UR–93-269) **Dynamic buckling of containments: The influence of damping.** Farrar, C.R.; Duffey, T.A.; Goldman, P.A.; Bennett, J.G. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930803–3: 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology, Stuttgart (Germany), 16-20 Aug 1993). Order Number DE93007372. Source: OSTI; NTIS; INIS; GPO Dep.

The seismic buckling capacities of representative thin, unstiffened elastic containment shells are investigated to evaluate the sensitivity of buckling to the damping level. The finite element method with transient time integration is utilized with both actual earthquake acceleration-time signals and artificial time histories generated from regulatory spectra. The dynamic response and subsequent buckling of the selected containment shells are found to be highly dependent on both damping level and the degree to which the input signal excites the fundamental shear-bending mode of the shell. Transient stresses and buckling levels for the two containment shells induced by the seismic inputs were reduced in the range of 12% to 111% by increasing the damping level from 1% to 4% of critical.

23648 (NUREG–0090-Vol.15-No.4) **Report to Congress on abnormal occurrences, October–December 1992: Volume 15, No. 4.** Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data. Mar 1993. 22p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Section 208 of the Energy Reorganization Act of 1974 identifies an abnormal occurrence as an unscheduled incident or event that the Nuclear Regulatory Commission determines to be significant from the standpoint of public health or safety and requires a quarterly report of such events to be made to Congress. This report covers the period from October 1 through December 31, 1992. There are two abnormal occurrences at nuclear power plants and six abnormal occurrences involving medical misadministration (all therapeutic) at NRC-licensed facilities discussed in this report. No abnormal occurrences were reported by the NRC's Agreement States. The report also contains information updating three previously reported abnormal occurrences.

23649 (NUREG–0797-Suppl.27) **Safety evaluation report related to the operation of Comanche Peak Steam Electric Station, Unit 2 (Docket No. 55-446).** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Apr 1993. 44p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Supplement 27 to the Safety Evaluation Report related to the operation of the Comanche Peak Steam Electric Station (CPSES), Unit 2 (NUREG-0797), has been prepared by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission (NRC). The facility is located in Somervell County, Texas, approximately 40 miles southwest of Fort Worth, Texas. This supplement reports the status of certain issues that had not been resolved when the Safety Evaluation Report and Supplements 1, 2, 3, 4, 6, 12, 21, 22, 23, 24, 25, and 26 to that report were published. This supplement deals primarily with Unit 2 issues. This twenty-seventh supplement, which is in support of the full-power license for Unit 2, provides updated information on the issues that had been considered previously, as well as the evaluation of issues that havearisen since the twenty-sixth supplement was issued. This evaluation addresses all of the issues necessary to support the issuance of a full-power license for Unit 2.

23650 (NUREG–1125-Vol.14) **A compilation of reports of the Advisory Committee on Reactor Safeguards: 1992 Annual: Volume 14.** Nuclear Regulatory Commission, Washington, DC (United States). Apr 1993. 186p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This compilation contains 50 ACRS reports submitted to the Commission, Executive Director for Operations, or to the Office of Nuclear Regulatory Research, during calendar year 1992. It also includes a report to the Congress on the NRC Safety Research Program. All reports have been made available to the public through the NRC Public Document Room and the US Library of Congress. The reports are divided into two groups: Part 1: ACRS Reports on Project Reviews, and Part 2: ACRS Reports on Generic Subjects. Part I contains ACRS reports alphabetized by project name and by chronological order within project name. Part 2 categorizes the reports by the most appropriate generic subject area and by chronological order within subject area.

23651 (NUREG–1485) **Unauthorized forced entry into the protected area at Three Mile Island Unit 1 on February 7, 1993.** Nuclear Regulatory Commission, Washington, DC (United States). Apr 1993. 128p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

On February 7, 1993, at 6:53 a.m. Eastern Standard Time (EST) an intruder drove into tile site owner-controlled area, through a gate into the protected area of Three Mile Island Nuclear Generating Station, Unit I (TMI-1) and crashed through a roll-up door on the Turbine Building. TMI Security reported this event to the US Nuclear Regulatory Commission's (NRC's) Headquarters operations officer and declared a Security Emergency upon determining that the protected area of the plant had been compromised. At 7:23 a.m., the TMI-1 shift supervisor officially notified the NRC Headquarters operations officer that he had declared a Site Area Emergency effective at 7:05 a.m. Upon considering the possible significance to physical security and the regulatory questions that could result from the event, the NRC Executive Director for Operations established an incident investigation team to determine what happened and make appropriate findings and conclusions. In this report the team described the event and the response to the event, evaluated the regulatory requirements, and presented the team's findings and conclusions.

23652 (NUREG/CP–0126-Vol.1) **Proceedings of the US Nuclear Regulatory Commission twentieth water reactor safety information meeting: Volume 1, Plenary session, Advanced reactor research, Advanced passive LWRs, Advanced instrumentation and control hardware, Advanced control system technology, Human factors research, EPRI's nuclear safety research and development.** Weiss, A.J. The individual papers have been cataloged separately.

23655 (NUREG/CR–4273) **Crack propagation in high strain regions of Sequoyah containment.** Greimann, L. (Ames Lab., IA (United States)); Fanous, F.; Bluhm, D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Ames Lab., IA (United States). Mar 1993. 47p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-82. (IS–4878). Source: OSTI; NTIS; INIS; GPO.

The rate of release of radioactive materials from a containment during a severe accident has a significant impact on the consequences of the accident. One hypothesis for a containment leakage model states that the containment will develop a controlled, relatively small leak before the pressure reaches the point where a general rupture of the shell occurs. Another states that overall failure will occur with total release of the vessel contents almost instantaneously. The Sequoyah ice condenser containment vessel has been studied for some time to predict the possible location and extent of leakage which could occur during a severe accident. In this work, three critical high strain locations were studied to predict crack propagation from an initially small defect. The 1/2-inch plate near the Sequoyah springline was selected for further study. A detailed finite element model of the region was prepared and a virtual crack extension method for calculating the J integral was developed for use with the general purpose finite element program. The pressure in the model was increased to 78 psi which produced a maximum membrane strain of 6.5 percent. At this point the surface crack was assumed to propagate through the plate and leakage began. Using the virtual crack extension method, two through cracks with different lengths were found to be unstable at this pressure which would allow almost instantaneous release of the vessel contents.

23656 (NUREG/CR–4551-Vol.7-Rev.1-Pt.1) **Evaluation of severe accident risks: Zion, Unit 1, Main report: Volume 7, Revision 1, Part 1.** Park, C.K. In support of the Nuclear Regulatory Commission's (NRC's) assessment of the risk from severe accidents at commercial nuclear power plants in the US reported in NUREG-1150, revised calculation of the risk to the general public from severe accidents at the Zion Power Station, Unit 1 has been completed. This power plant, located on the western shore of Lake Michigan on the outskirts of Zion, is operated by the Commonwealth Edison Company. The emphasis in this risk analysis was not on determining a "so-called" point estimate of risk. Rather, it was to determine the distribution of risk, and to discover the uncertainties that account for the breadth of this distribution. Off-site risk initiation by events, both internal to the power station and external to the power station was assessed.

23657 (NUREG/CR–4551-Vol.7-Rev.1-Pt.2A) **Evaluation of severe accident risks, Zion, Unit 1: Appendix A: Volume 7, Revision 1, Part 2A.** Park, C.K. 23659 (NUREG/CR–4832-Vol.9) **Analysis of the LaSalle Unit 2 Nuclear Power Plant: Risk Methods Integration and Evaluation Program (RMIEP): Volume 9.** Lambright, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Brosseau, D.A.; Payne, A.C. Jr.; Daniel, S.L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 702p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (SAND–92-0537-Vol.9). Source: OSTI; NTIS; INIS; GPO.

This report is a description of the internal fire analysis performed on the LaSalle County Nuclear Generating Station, Unit II. Insights gained from the NUREG-1150 fire analyses of Peach Bottom and Surry were used to the greatest extent possible in this risk assessment. As part of this effort, a new data base for fires was constructed (NUREG/CR-4586). This data base aided in quantification of initiating event frequencies. The most detailed integration with internal events analysis to date in fire risk assessment was also accomplished. The same system fault trees used for internal events were utilized in the fire analysis, which included modeling of components down to the contact pair level. Subsidiary equations were created to map the effects of cable failures and spurious actuations. For all components modeled in the internal event fault trees, associated cables were identified and component and cable locations were traced and mapped into the fault trees. A detailed screening analysis was performed which showed most plant areas had a negligible contribution to fire-induced core damage frequency. A detailed analysis of the fire risk resulted in a total (mean) core damage frequency of 3.21E-5 per year.

23660 (NUREG/CR–5801) **Procedure for analysis of common-cause failures in probabilistic safety analysis.** Mosleh, A. (Maryland Univ., College Park, MD (United States). Dept. of Materials and Nuclear Engineering). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; Sandia National Labs., Albuquerque, NM (United States); Maryland Univ., College Park, MD (United States). Dept. of Materials and Nuclear Engineering. Apr 1993. 45p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (SAND–91-7087). Source: OSTI; NTIS; INIS; GPO.

This report provides practical guidelines for treatment of common-cause failures (CCF) in risk and reliability studies. The procedures outlined in this report are organized according to three phases of analysis, screening analysis, detailed qualitative analysis, and detailed quantitative analysis. The results of the screening analysis phase include conservative identification of potential common-cause vulnerabilities and determination of the scope and focus for more detailed analysis in Phases II and III. Phase II, the detailed qualitative analysis, provides a better understanding of the plant-specific susceptibilities of the systems and components to causes and coupling mechanisms of CCF. The information from this phase can then be used as a basis for a plant-specific quantitative assessment of CCF frequencies. Detailed guidelines are provided for Phase III to aid the analyst in using this qualitative information and generic data in developing a plant-specific CCF base. Depending on the overall objective of the study, CCF analysis can stop at the end of any of the three phases.

23661 (NUREG/CR–5937) **Intentional depressurization accident management strategy for pressurized water reactors.** Brownson, D.A. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Haney, L.N.; Chien, N.D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; EG and G Idaho, Inc., Idaho Falls, ID (United States). Apr 1993. 173p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2688). Source: OSTI; NTIS; INIS; GPO.

In a previous investigation of the Surry nuclear power station, it was concluded that intentional depressurization of the reactor coolant system (RCS) could prevent or mitigate the effects of direct containment heating (DCH) during a station blackout transient. Two strategies, early and late depressurization, were investigated as methods to mitigate DCH. The investigation concluded that since there are greater opportunities to recover plant functions before core damage occurs and operator response uncertainties are lessened, the strategy of late depressurization is preferred over early depressurization. The results of the Surry analysis were extended to other US pressurized water reactors (PWRS) in order to evaluate their capability to successfully employ the late depressurization strategy to prevent or mitigate DCH. By applying appropriate scaling factors to the selected key parameters, this evaluation resulted in the categorization of four PWR groups based upon their perceived late depressurization capability. In this report, a PWR representative of each of the four PWR groups was chosen for detailed analysis of its capability to intentionally depressurize employing the late depressurization strategy. The phenomenological behavior, hardware performance, and operational performance of these PWRs during the intentional depressurization strategy were considered. The phenomenological behavior was analyzed using the SCDAP/RELAP5/MOD3 severe accident analysis code. The results of these evaluations were then extended to the remaining PWRs comprising each PWR group.

23662 (NUREG/CR–5976) **Development and use of a train-level probabilistic risk assessment.** Smith, C.L. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Fowler, R.D.; Wolfram, L.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; EG and G Idaho, Inc., Idaho Falls, ID (United States). Apr 1993. 71p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2694). Source: OSTI; NTIS; INIS; GPO.

The Idaho National Engineering Laboratory examined the potential for the development of train-level probabilistic risk assessment (PRA) databases. These train-level databases will allow the Nuclear Regulatory Commission to investigate effects on plant core damage frequency (CDF) given a train is failed or taken out of service. The intent of this task was to develop user-friendly databases that required a minimalamount of personnel involvement to be usable. It was originally intended that the train-level models would not be expanded to include basic events below the top gate of a train, with the possible exception of including some of the major train-related components (e.g., important pumps and motor-operated valves). It was found that a database similar to the original plant PRA provided the accuracy needed to measure the changes in plant CDF. The Peach Bottom Unit 2 NUREG-1150 PRA (a large fault tree model) and the Beaver Valley Unit 2 IPE (a large event tree model) were selected to demonstrate the feasibility of developing train-level databases. Five different methods for developing train-level databases were hypothesized and are examined. Ultimately, two train-level databases were developed using the Peach Bottom Unit 2 PRA and onetrain-level database was developed using the Beaver Valley Unit 2 IPE. The development, use, limitations, and results of these train-level databases are discussed.

23663 (NUREG/CR–6011) **Review of structure damping values for elastic seismic analysis of nuclear power plants.**

Hashimoto, P.S. (EQE Engineering Consultants, Irvine, CA (United States)); Steele, L.K.; Johnson, J.J.; Mensing, R.W. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; EQE Engineering Consultants, Irvine, CA (United States). Mar 1993. 711p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Current US Nuclear Regulatory Commission guidance on structure damping values for elastic seismic design analysis of nuclear power plants are contained in Regulatory Guide 1.61 (R.G. 1.61). The objectives of the study described in this report are to investigate the adequacy of R.G1.61 structure damping values based on currently available data, and to recommend revisions to R.G. 1.61 as appropriate. Measured structure damping values, and associated structure, foundation, excitation, and input/response parameters, were collected and compiled. These data were analyzed to identify the parameters that significantly influence structure damping and to quantify structure damping in terms of these parameters. Based on this study, current R.G. 1.61 damping values for structure design are either adequate, or require only minor revision, depending on the structure material. More explicit guidance on structure damping values for seismic analysis to determine input to equipment has been prepared, along with other recommendations to improve the applicability of R.G. 1.61.

23664 (NUREG/CR–6027) **Preliminary evaluation of snubber single failures.** Ware, A.G. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Blandford, R.K.; Kelly, D.L.; Morton, D.K.; Nitzel, M.E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; EG and G Idaho, Inc., Idaho Falls, ID (United States). Apr 1993. 49p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2697). Source: OSTI; NTIS; INIS; GPO.

The United States Nuclear Regulatory Commission developed FIN L2430, Preliminary Evaluation of Snubber Single Failures, with the objective of performing a preliminary evaluation of the safety implication of a potential single failure of a snubber used to support safety-related piping or equipment. The Idaho National Engineering Laboratory staff conducted a qualitative review of a large number of light water reactor systems, and a quantitative stress analysis of four systems. A candidate list was developed that ranked the systems as having a high, medium, or low probability of causing a significant increase in the core damage frequency should a single snubber fail to function. Two systems were ranked high, a Westinghouse PWR ice condenser main steam containment penetration and a General Electric BWR Mark I torus. Six systems were ranked medium and the remaining 30 were ranked as low or low-to-medium. The two systems ranked high and two systems ranked medium, a Westinghouse PWR ice condenser auxiliary feedwater line and a Combustion Engineering PWR System 80 reactor coolant system loop drain line, were chosen for a quantitative stress analysis. Of the four systems analyzed, only the PWR ice condenser main steam containment penetration is judged to be significantly susceptible to the failure of a single snubber.

23665 (ORNL/FTR–4432) **Boiling Water Reactor Core Melt Progression Phenomena Program: Foreign trip report, September 19–October 10, 1992.** Ott, L.J. Oak Ridge National Lab., TN (United States). 14 Oct 1992. 24p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009221. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Statement of Work (August 1992) for the Boiling Water Reactor (BWR) Core Melt Progression Phenomena Program at Oak Ridge National Laboratory (ORNL) provides for pretest and posttest analyses of CORA BWR experiments performed at KfK and for participation in the dry core CORA test (CORA-33). The traveler provided assistance to the CORA experimental staff in the preparation of experimental test conditions and experimental test procedure for CORA-33. The traveler attended the 1992 International CORA Workshop and the OECD/NEA ISP-31 Workshop at KfK, FRG. Participation included the presentation of a paper on work performed by the Boiling Water Reactor Core Melt Progression Phenomena Program on pretest and posttest analyses of CORA BWR experiments.

23666 (ORNL/FTR–4433) **[Advanced Light Water Reactor (ALWR) Utility Requirements Document Program]: Foreign trip report, September 27–October 4, 1992.** White, J.D. Oak Ridge National Lab., TN (United States). 16 Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009930. Source: OSTI; NTIS (US Sales Only); GPO Dep.

To participate in the DOE/Electric Power Research Institute Advanced Light Water Reactor (ALWR) Utility Requirements Document Program visit to the French utility instrumentation and control facilities and to the thermal-hydraulic test facilities near Milan and to participate in the Utility Steering Committee Meeting in Rome. This travel was part of current programmatic assignments which are: to review the requirements documents being generated for the ALWR, and to perform R&D on the use of computer-based technologies in the control systems being developed for the DOE-sponsored Advanced Liquid Metal Reactor (ALMR).

23667 **Nuclear reactor flow control method and apparatus.** Church, J.P. To Dept. of Energy. 23 Apr 1991. USA patent application 7-689,425. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012016. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes method and apparatus for improving coolant flow in a nuclear reactor during accident as well as nominal conditions. The reactor has a plurality of fuel elements in sleeves and a plenum above the fuel and through which the sleeves penetrate. Holes are provided in the sleeve so that coolant from the plenum can enter the sleeve and cool the fuel. The number and size of the holes are varied from sleeve to sleeve with the number and size of holes being greater for sleeves toward the center of the core and less for sleeves toward the periphery of the core. Preferably the holes are all the same diameter and arranged in rows and columns, the rows starting from the bottom of every sleeve and fewer rows in peripheral sleeves and more rows in the central sleeves.

23668 (PNL-SA–21833) **A computer program for estimating decommissioning costs for light water reactors.** Bierschbach, M.C. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–32: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009476. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses a desk-top computer program has been developed for estimating the costs, waste volumes, and occupational radiation exposures associated with decommissioning light-water reactor power stations. Cost categories and cost algorithms used in the program are discussed and a brief description of the user interface is given.

23669 (SAND–90-1827) **Fire safety lessons learned from the design and operation of commercial nuclear reactor facilities.** Nowlen, S.P. Sandia National Labs., Albuquerque, NM (United States). Feb 1993. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93010609. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the fire safety "lessons learned" that have resulted from the past 20 years of commercial nuclear power plant operations and 15 years of US Nuclear Regulatory Commission sponsored fire safety research. These insights are intended to provide guidance to the Department of Energy (DOE) in the selection of appropriate design, construction, and operational fire safety criteria for the plannedNew Production Reactor (NPR). The potential for fire-induced equipment damage has been consistently identified as an important core damage risk issue for commercial nuclear reactors. A significant knowledge base regarding many aspects of fire safety has been gained as a result of the commercial industry experience, research sponsored by the US Nuclear Regulatory Commission (USNRC) and from the results of fire risk assessments. However, for the commercial nuclear industry, the

implementation of fire safety provisions has been a long and difficult process. Much of this difficulty can be attributed to the fact that the USNRC's fire safety regulations were implemented as retrofit rules, which often required extensive and expensive plant modifications. Despite the improvements in the fire safety knowledge base, a number of fire safety issues remain unaddressed, are very poorly understood, and/or have not been addressed-by past fire risk assessments. For NPR it will be important to implement fire safety as a part of the plant design and construction. It is also clear that the regulations that apply to the current generation of commercial reactors will not represent an adequate design basis for new reactors. Anticipated changes in the nuclear industry fire safety requirements should be incorporated into the NPR design in order to ensure that NPR achieves a level of fire safety which both exceeds that of current reactor sites and which will continue to comply with future fire safety requirements.

23670 (SAND–92-2021) **An Integral Effects Test to investigate the effects of condensate levels of water and preexisting hydrogen on direct containment heating in the Surtsey Test Facility: The IET-7 experiment.** Allen, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Blanchat, T.K.; Pilch, M.; Nichols, R.T. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93007933. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the seventh experiment of the Integral Effects Test (IET-7) series. The experiment was conducted to investigate the effects of preexisting hydrogen in the Surtsey vessel on direct containment heating. Scale models of the Zion reactor pressure vessel (RPV), cavity, instrument tunnel, and subcompartment structures were constructed in the Surtsey Test Facility at Sandia National Laboratories. The RPV was modeled with a melt generator that consisted of a steel pressure barrier, a cast MgO crucible, and a thin steel inner liner. The melt generator/crucible had a hemispherical bottom head containing a graphite limitor plate with a 4-cm exit hole to simulate the ablated hole in the RPV bottom head that would be formed by ejection of an instrument guide tube in a severe nuclear power plant accident. The cavity contained 3.48 kg of water, and the containment basement floor inside the cranewall contained 71 kg of water, which corresponds to scaled condensate levels in the Zion plant. A 43-kg initial charge of iron oxide/aluminum/chromium thermite was used to simulate corium debris on the bottom head of the RPV. Molten thermite was ejected by steam at an initial pressure of 5.9 MPa into the reactor cavity.

23671 (SAND–92-2538/1) **Heavy Water New Production Reactor design review guidelines: Volume 1, Main report: Final report.** Bergeron, K.D. (Sandia National Labs., Albuquerque, NM (United States)); Slezak, S.E.; Leach, C.E. Sandia National Labs., Albuquerque, NM (United States); Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012102. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The first step in Sandia National Laboratories' program to support the USDOE's Heavy Water New Production Reactor program in the area of severe accident prevention and mitigation was to perform a thorough review of all related technical information. This report is the product of that first step; it is a compendium of key information on core melt accidents written by nineteen specialists in a broad range of scientific and engineering fields. Topics covered include: In-Vessel Melt Progression; Molten Debris-Concrete Interactions; Fuel-Coolant Interactions; Hydrogen Combustion and Distribution; Mitigation Strategies; and Computer Simulation Codes and Accident Analysis. These reviews cover relevant work by specialists at Sandia as well as many other laboratories and institutes throughout the world. For each topic area, annotated bibliographies of key references are also provided. This document is Volume 1, the main report.

23672 (SAND–92-2538-Vol.2) **Heavy Water New Production Reactor design review guidelines: Volume 2, Appendices: Final report.** Bergeron, K.D. (Sandia National Labs., Albuquerque, NM (United States)); Slezak, S.E.; Leach, C.E. Sandia National Labs., Albuquerque, NM (United States); Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 786p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012080. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The first step in Sandia National Laboratories' program to support the USDOE's Heavy Water New Production Reactor program in the area of severe accident prevention and mitigation was to perform a thorough review of all related technical information. This report is the product of that first step; it is a compendium of key information on core melt accidents written by nineteen specialists in a broad range of scientific and engineering fields. Topics covered include: In-Vessel Melt Progression; Molten Debris-Concrete Interactions; Fuel-Coolant Interactions; Hydrogen Combustion and Distribution; Mitigation Strategies; andComputer Simulation Codes and Accident Analysis. For each topic area, annotatedbibliographies of key references are also provided. This document, Volume 2, contains appendices A-O of the main report.

23673 (SAND–93-0592C) **Containment bellows testing under extreme loads.** Splezter, B.L.; Lambert, L.D.; Parks, M.B. Sandia National Labs., Albuquerque, NM (United States). [1993]. 7p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930803–6: 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology, Stuttgart (Germany), 16-20 Aug 1993). Order Number DE93009848. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories (SNL) is conducting several research programs to help develop validated methods for the prediction of the ultimate pressure capacity, at elevated temperatures, of light water reactor (LWR) containment structures. To help understand the ultimate pressure of the entire containment pressure boundary, each component must be evaluated. The containment pressure boundary consists of the containment shell and many access, piping, and electrical penetrations. The focus of the current research program is to study the ultimate behavior of flexible metal bellows that are used at piping penetrations. Bellows are commonly used at piping penetrations in steel containments; however, they have very few applications in concrete (reinforced or prestressed) containments. The purpose of piping bellows is to provide a soft connection between the containment shell and the pipe are attached while maintaining the containment pressure boundary. In this way, piping loads caused by differential movement between the piping and the containment shell are minimized. SNL is conducting a test program to determine the leaktight capacity of containment bellows when subjected to postulated severe accident conditions. If the test results indicate that containment bellows could be a possible failure mode of the containment pressure boundary, then methods will be developed to predict the deformation, pressure, and temperature conditions that would likely cause a bellows failure. Results from the test program would be used to validate the prediction methods. This paper provides a description of the use and design of bellows in containment piping penetrations, the types of possible bellows loadings during a severe accident, and an overview of the test program, including available test results at the time of writing.

23674 (SAND–93-0593C) **Separate effects testing to investigate liner tearing of the 1:6-scale reinforced concrete containment building.** Spletzer, B.L.; Lambert, L.D. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930803–7: 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology, Stuttgart (Germany), 16-20 Aug 1993). Order Number DE93009849. Source: OSTI; NTIS; INIS; GPO Dep.

The US Nuclear Regulatory Commission (NRC) is investigating the performance of containments subject to severe accidents. This work is being performed by Sandia National Laboratories (SNL). In 1987, a 1:6-scale Reinforced Concrete Containment (RCC) model was tested to failure. The failure mode was a liner tear. As a

result, a separate effects test program has been conducted to investigate liner tearing. This paper discusses the design of test specimens and the results of the testing. The post-test examination of the 1:6-scale RCC model revealed that the large tear was not an isolated event. Other small tears in similar locations were also discovered. All tears occurred near the insert-to-liner transition which is also the region of closest stud spacing. Also, all tears propagated vertically, in response to the hoop strain. Finally, all tears were adjacent to a row of studs. The tears point to a mechanism which could involve the liner/insert transition, the liner anchorage, and the material properties. The separate effects tests investigated these effects. The program included the design of three types of specimens with each simulating some features of the 1:6-scale RCC model. The specimens were instrumented using strain gages and photoelastic materials.

23675 (UCRL-ID–110822) **On seismic hazards/risk and power plant design.** Chung, D.H. Lawrence Livermore National Lab., CA (United States). May 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009454. Source: OSTI; NTIS; INIS; GPO Dep.

The basic premise of probabilistic seismic hazard analysis (PSHA) is to calculate the probability of exceeding various levels of ground motions at a site of interest. We must assess (1) the possible sources of earthquakes that might affect ground motions at the site, (2) the maximum magnitude earthquakes that each source is capable of generating, (3) the recurrence rate of earthquakes of all magnitudes up to themaximum on each source; and (4) the attenuation of strong ground motions as a function of source to site distance and magnitude. These four basic elements in the PSHA methodologies have not changed significantly from C.A. Cornell's original work, but some specific details about individual steps involved in the PSHA applications have been improved over the last 20 years. What has changed dramatically in recent years has been our scientific ability to estimate those physical quantities in the PSHA elements above with more confidence and to quantify more appropriately the uncertainties associated with the input parameters of these basic elements.

23676 (UCRL-JC–110420) **On fire risk/methodology for the next generation of reactors and nuclear facilities.** Majumdar, K.C.; Alesso, H.P.; Altenbach, T.J. Lawrence Livermore National Lab., CA (United States). 15 Oct 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9301102–1: American Nuclear Society (ANS) meeting, Clearwater, FL (United States), 27 Jan 1993). Order Number DE93011876. Source: OSTI; NTIS; INIS; GPO Dep.

Methodologies for including fire in probabilistic risk assessments (PRAs) have been evolving during the last ten years. Many of these studies show that fire risk constitutes a significant percentage of external events, as well as the total core damage frequency. This paper summarizes the methodologies used in the fire risk analysis of the next generation of reactors and existing DOE nuclear facilities. Methodologies used in other industries, as well as existing nuclear power plants, are also discussed. Results of fire risk studies for various nuclear plants and facilities are shown and compared.

23677 (UCRL-JC–111964) **Determining the controlling earthquake from probabilistic hazards for the proposed Appendix B.** Bernreuter, D.L. Lawrence Livermore National Lab., CA (United States). Oct 1992. 26p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921007–26: 20. water reactor safety information meeting, Bethesda, MD (United States), 21-23 Oct 1992). Order Number DE93012491. Source: OSTI; NTIS; INIS; GPO Dep.

The new proposed Appendix B to 10CFR100 requires that both probabilistic and deterministic evaluations be made. The details of how to perform these evaluations are outlined in the proposed draft Regulatory Guide DG-1015. In DG-1015, one element of the probabilistic evaluation recommends determining the controlling earthquake from the probabilistic seismic hazard analysis (CE-PA). In this paper, the concept of the CEPA is discussed along with the approach that is suggested to determine the CE-PA. This paper reviews the basis for the various key choices that must be made. We also apply the approach to eight sites using the LLNL seismic hazard methodology developed for NRC.

23678 (WSRC-MS–91-531) **RELAP5/MOD3 code assessment with flow instability testing of an annular geometry fuel assembly.** Chen, K.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–5: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93007449. Source: OSTI; NTIS (US Sales Only); GPO Dep.

RELAP5/MOD3 was assessed with data obtained from flow excursion tests in an annular geometry test assembly to show that the code can model the thermal-hydraulic behavior of New Production Reactor-Heavy Water Reactor (NPR-HWR) fuel assemblies. The flow excursion tests were upflow tests conducted using an electrically heated full-scale model of a Savannah River Site (SRS) fuel assembly. Unpowered and powered steady-state tests, power ramp tests, and simulated loss of coolant accident tests were run. This assessment indicates that the single-phase thermal-hydraulic predictions of RELAP5/MOD3 agree with the measurements. RELAP5/MOD3 underestimates the power required for the onset of flow instability.

23679 (WSRC-MS–92-262) **Response of structures to energetic events for the Savannah River Site production reactors probabilistic risk assessment.** Santa Cruz, S.M. (Science Applications International Corp., Albuquerque, NM (United States)); Smith, D.C.; Yau, W.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930803–1: 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology, Stuttgart (Germany), 16-20 Aug 1993). Order Number DE93001612. Source: OSTI; NTIS; INIS; GPO Dep.

The response of structures to energetic events postulated to arise in a probabilistic risk assessment (PRA) of a Savannah River Site (SRS) production reactor is addressed. Energetic events that arise in PRAs can damage structures and therefore have a significant influence on subsequent accident progression. Consequently, the structural response is important to the calculated risk of operating a plant. Difficulties are encountered, however, in the analysis of structural response of components to energetic loadings. First, the analysis of energetic events often does not provide well-defined static or dynamic loads acting on the structures. Secondly, risk assessments, by their nature, address a wide range of events that are not necessarily precisely defined. This paper describes an approach taken to develop the structural analysis required to support the PRA of the SRS production reactor, that overcomes these difficulties.

23680 (WSRC-MS–92-292) **Development of an Accident Management Program for the K-Reactor cooling tower at the Savannah River Site.** Simpkins, P.J.; Britt, T.E.; Lansaw, K.J. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930601–11: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93009898. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the Accident Management program at SRS has developed a new methodology for the safe operation of the K-Reactor. This methodology was recently applied during the loss of ultimate heat sink analysis which answers the question of which alternatives are present when the Reactor loses it primary cooling source. With the addition of a new cooling tower there is a need to reapply and perhaps modify the analysis to include the effects of the tower on the existing systems. This process combines the efforts of many different groups. Included in these efforts are interviews with operators, information from documents and drawings, data from computer codes, practice from in-plant drills, and efforts from multi-functional organizations. The central theme of this paper is the explanation of the task involved in the methodology and its application to the cooling tower addition.

23681 (WSRC-MS–92-365) **Nuclear reactor coolant spill as result of multichannel flow.** Steimke, J.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–15: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93009876. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses a leak of primary coolant which was detected as a nuclear production rector at the Savannah River Site (SRS) in South Carolina was approaching initial criticality. Control rods were being withdrawn when the leak detectors alarmed. The apparent location of the several gallon leak was where the control rods emerged from the top of the reactor. The reactor was shut down immediately. Control rods in SRS reactors are clustered in groups of seven and contained in a shell called a septifoil through which coolant flows. A new design of septifoil had been installed in a reator prior to the leak, a testing program was begun to installed in a reactor Prior to the leak. In response to the leak, a testing program was begun to determine the cause of the leak and to test methods for preventing future occurrences.

23682 (WSRC-MS–92-366) **Measurement of local void fraction in a ribbed annulus.** Steimke, J.L. Westinghouse Savannah River Co., Aiken, SC (United States). 22 Dec 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–9: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93009808. Source: OSTI; NTIS; INIS; GPO Dep.

The computer code FLOWTRAN-TF is used to analyze hypothetical hydraulic accidents for the nuclear reactor at the Savannah River Site. During a hypothetical Large Break Loss-of-Coolant Accident (LOCA), reactor assemblies would contain a two-phase mixture of air and water which flows downward. Reactor assemblies consist of nested, ribbed annuli. Longitudinal ribs divide each annulus into four subchannels. For accident conditions, air and water can flow past ribs from one subchannel to another. For FLOWTRAN-TF to compute the size of those flows, it is necessary to know the local void fraction in the region of the rib. Measurements have previously been made of length-average void fraction in a ribbed annulus. However, no direct measurements were available of local void fraction. Due to the lack of data, a test was designed to measure local void fraction at the rib. One question addressed by the test was whether void fraction at the rib is solely a function of azimuthal-average void fraction or a function of additional variables such as pressure boundary conditions. This report provides a discussion of this test.

23683 (WSRC-MS–92-368) **Reverse flow through a large scale multichannel nozzle.** Duignan, M.R.; Nash, C.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–10: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93009809. Source: OSTI; NTIS; INIS; GPO Dep.

A database was developed for the flow of water through a scaled nozzle of a Savannah River Site reactor inlet plenum. The water flow in the nozzle was such that it ranged from stratified to water solid conditions. Data on the entry of air into the nozzle and plenum as a function of water flow are of interest in loss-of-coolant studies. The scaled nozzle was 44 cm long, had an entrance diameter of 95 mm, an exit opening of 58 mm x 356 mm, and an exit hydraulic diameter approximately equal to that of the inlet. Within the nozzle were three flow-straightening vanes which divided the flow path into four channels. All data were taken at steady-state and isothermal (300 K $\pm$ 1.5 K) conditions. During the reverse flow of water through the nozzle the point at which air begins to enter was predicted within 90% by a critical weir-flow calculation. The point of air entry into the plenum itself was found to be a function of flow conditions.

23684 (WSRC-MS–92-406) **Flow instability testing of annular geometry fuel elements for LOCA and slow ramp transient with upflow of coolant.** Smith, A.C. (Westinghouse Savannah River Co., Aiken, SC (United States)); Blake, J.E.; Childerson, M.T.; Ohrn, T.R.; Privette, R.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930830–8: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93008794. Source: OSTI; NTIS; GPO Dep.

This report discusses testing performed to provide data for evaluation and benchmarking of computer codes used for predicting the performance of reactor fuel elements of annular geometry with upward flow of coolant.

23685 (WSRC-RP–90-1338-Vol.1-Del.Ver.) **Analyses and evaluation of the cooling water reservoir and process effluent sump structures, Savannah River Site: Volume 1.** Bandyopadhyay, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1990. 194p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93009744. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report describes the seismic analysis and evaluation of the Cooling Water Reservoir (CWR) structures.and the Process Effluent Sump (PES) building at the 100-K area of the Savannah River Site. The objective of this work was to evaluate the responses of the CWR and PES structures when subjected to the Design Basis Earthquake (DBE), which is described by the US Nuclear Regulatory commission's Regulatory Guide 1.60 horizontal spectrum shape anchored at 0.g zero period acceleration (ZPA). The vertical input is defined as 2/3 of the horizontal spectra through the entire frequency range of interest. The CWR and PES structures are part of the Cooling Water System (CWS) which is the primary system to remove residual heat from the reactor. Though the seismic analyses and structural evaluations were conducted specifically for the 100-K area CWR and PES structures, the results and conclusions also apply to the corresponding structures in the 100-L and 100-P areas. This is based on a parametric study and comparisons of the structures and available soil properties of the three areas as discussed in this report.

23686 (WSRC-RP–90-1338-Vol.2) **Analyses and evaluation of the cooling water reservoir and process effluent sump structures, Savannah River Site: Volume 2.** Bandyopadhyay, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1990. 259p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93009882. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report describes the seismic analysis and evaluation of the cooling Water Reservoir (CWR) structures and the Process Effluent Sump (PES) building at the 100-K area of the Savannah River Site. The objective of this work was to evaluate the responses of the CWR and PES structures when subjected to the Design Basis Earthquake (DBE), which is described by the u.S. Nuclear Regulatory commission's Regulatory Guide 1.60 horizontal spectrum shape anchored at 0.209 zero period acceleration (ZPA). The vertical input is defined as 2/3 of the horizontal spectra through the entire frequency range of interest. The CWR and PES structures are part of the cooling Water System (CWS) which is the primary system to remove residual heat from the reactor. Though the seismic analyses and structural evaluation were conducted specifically for the 100-K area CWR and PES structures, the results and conclusions also apply to the corresponding structures in the 100-L and loop areas. This is based on a parametric study and comparisons of the structures (Section 1-3) and available soil properties of the three areas as discussed later in this report. This document, Volume 2, provides Appendix C of the report. This Appendix provides plots and digitized tables of floor acceleration response spectra.

23687 (WSRC-RP–92-653) **Numerical modeling of the expansion phase of steam explosions: Part 1, Method and validation.** Hyder, M.L. (Westinghouse Savannah River Co., Aiken, SC (United States)); Farawila, Y.M.; Abdel-Khalik, S.I.; Halvorson, P.J. Westinghouse Savannah River Co., Aiken, SC (United States). May 1992. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013689. Source: OSTI; NTIS; INIS; GPO Dep.

In the development of the Severe Accident Analysis Program for the Savannah River production reactors, it was recognized that certain accidents have -the potential for causing damaging steam

explosions. Steam explosions can occur when metals, such as the aluminum-based fuel used at Savannah River, are melted and come into contact with water. This condition is unstable, and local turbulence can lead to the generation of great quantities of steam within a few milliseconds. This phenomenon has been observed in several reactor incidents and experiments (BORAX, SPERT-1, SL-1, probably Chernobyl) where it caused damage to the reactor and associated structures. The massive SRS reactor buildings are likely to withstand any imaginable steam explosion. However, reactor components and building structures including hatches, ventilation ducts, etc., could be at risk if such an explosion occurred. The goal for this study was to develop a computer code that could be used parametrically to predict the effects of various steam explosions on their surroundings. This would be able to predict whether a steam explosion of a given magnitude would be likely to fail a particular structure. This would require, of course, that the magnitude of the explosion be specified through some combination of judgment and calculation. The requested code, identified as the K-FIX(GT) code, was developed and delivered by the contractor, along with extensive documentation. The several individual reports that constitute the documentation are each being issued as a separate WSRC report. Documentation includes several model calculations, and. representation of these in graphic form. This report incorporates Report GTRSR-006, which gives an overview of the methods used in the development of K-FIX(GT), and the results of a comparison with experiments in the literature. The authors conclude that the results of the comparison calculation are in reasonable agreement with observations.

23688 (CONF-921275–, pp. 137-138) **Estimation on ventricular fibrillation current at high-frequency electric shocks.** Yamano, E. (Research Institute of Industrial Safety, Tokyo (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting*. Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Data have been accumulated extensively on threshold currents in ventricular fibrillation, a major cause of sudden death from electric shocks, in a range of utility frequencies, but data with high frequencies are not available sufficiently. This paper gives a consideration on one method to estimate ventricular fibrillation currents at frequencies exceeding 1 kHz. For the sensing current, the threshold current I_t increases with increasing frequency 'f'. While the increase begins with a small slope, a slope in the I_t-f curve in a range from 30 kHz to 100 kHz on a log-log section paper is from about 0.9 to 1.2 which remains approximately constant. Such an I_t-f curve may be approximated largely with a parallel circuit consisting of C and R. For the frequency dependence of the ventricular fibrillation, when a large number of data on animals and human beings are put in order, a threshold value may be established that is smaller (safer) than that from nearly all of the data if the time constant is set to CR = 0.7 ms, for example. 3 refs., 2 figs.

23689 (UCRL-ID–111412) **Electromechanical batteries and the electric utilities: An estimate of the potential market for high-strength fibers.** Post, R.F. Lawrence Livermore National Lab., CA (United States). 11 Aug 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013307. Source: OSTI; NTIS; GPO Dep.

This technical note presents an estimate of the market for high-strength fibers that could arise, based on the adoption of modular electromechanical batteries by the US electric utilities to satisfy their needs for distributed energy storage for load-leveling and energy reserves. It is shown that this market alone would involve a requirement for such fibers (from which to construct the rotors of the E-M batteries) involving many billions of dollars per year of sales. Counting in foreign markets, and other likely uses of the E-M battery in commercial and industrial settings, the demands would far exceed present-day world-wide production levels of the candidate fibers.

23690 (CONF-921276–, pp. 151-154) **Study on a temperature selective heat storage tank. Part 4.: Extraction of discharged cold and hot water.** Kamiya, Y. (Kanto Gakuin University, Yokohama (Japan)); Kurihara, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Investigation was made on a method in which discharged cold and hot water was temperature-selectively extracted from the temperature-selective heat storage tank without using control machinery at all. System adopted into the present investigation was to newly install the other damper-equipped extracting sub-tank than the conventional sub-tank and open/close the dampers with enforcement with Ni-Ti shape memory metal (NT). In the hot water extracting damper-opening/closing device, the dampers are opened/closed by a rod fitted at the end of shaft which moves from side to side upon fluctuation in NT spring constant following that in temperature. The dampers can be opened/closed at 35 to 45 centigrade and 10 centigrade in temperature by the damper-opening/closing device. As a result of experiment, extraction could be made of discharged hot and cold water which was lower than 40 centigrade nd about 12 centigrade, respectively in temperature. Both 35 centigrade and 15 centigrade layers were temperature-selectively taken out for the simultaneous hot and cold water extraction. The fitting angle of damper-opening/closing device is judged optimizable in value depending upon the utilization hours and thermal loss. 4 refs., 9 figs., 1 tab.

23691 (CONF-921276–, pp. 171-174) **Three-dimensional simulation of borehole seasonal energy system for the high-story building.** Saito, T. (Tohoku University, Sendai (Japan). Faculty of Engineering); Shinomiya, J. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. Wind Energy Association) Joint Conference. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

This paper proposes and simulates an air conditioning system for a high-story building using borehole heat storage process to suppress urban warming. Twenty-five vertical pipes drilled into ground to a depth of 100 m were used as one unit. Waste heat from a room cooling system and solar heat are stored in the borehole during summer, and are recovered from the boreholes to be used as a source for room heating and hot water supply. Solar cells are installed on half the area of the south wall to generate electric power. A three-dimensional analysis was performed on the units to clarify the heat storing and dissipating processes. A three-dimensional analysis was conducted to elucidate seasonal heat storing characteristics in soil temperatures of the borehole heat storing system. Use of 30 borehole units each with 12 m x 12 m was suitable for a 36-story building with three basements and a total floor area of 150,000 m^2. The system discharges no heat into the atmosphere, but stores heat in the soil to prevent urban warming. This system that utilizes solar energy and borehole heat storage reduces the energy consumption and CO2 emission by about 50% compared with conventional heat-pump room cooling and boiler room heating using air as the heat source. 11 refs., 9 figs., 5 tabs.

2508 Chemical

23692 (CONF-921276–, pp. 159-162) **Transmittance of working fluid (water and salt-water solution) for solar pond.** Kanayama, K. (Kitami Institute of Technology, Hokkaido (Japan)); Endo, N.; Baba, H.; Yanagida, E. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Water and salt water were measured in spectral transmittance by a spectral radiometer in order to support the performance measurement of solar saline pond. Investigation based on the molecular vibration being applied to the absorption band which appeared in the transmission spectrum of water, the total transmittance was calculated down to a water depth of 3m in the pond upon deducing the reason for which the spectral transmittance per the above spectrum heightened with heightening in salt concentration. The water gradually becomes an opaque body in spectral transmittance with lengthening in wave from the visible wave wavelength region (more than 0.6μm in wavelength) to the near infrared and infrared regions, through which absorption bands appear one after another. Such a phenomenon is attributable to the absorption bands of harmonic overtone due to the O-H-deformed vibration of water. Influenced also by the concentration in the visible wave wavelength, near infrared and infrared regions, the spectral transmittance of salt water heightens with heightening in concentration. Such a heightening in transmissibility is attributable to the dissolution of bipolar molecules of the water in the form of being taken in by Na^+ and Cl^-, which therefore controls the O-H-stretched vibration of water. As a result, the water and salt water could be obtained in total transmittance down to a water depth of 3m in the pond. 17 refs., 7 figs.

23693 (UCRL-JC–112177) **Effects of aqueous solution compositions on Aerocapacitor energy density.** Mayer, S.T.; Kaschmitter, J.L.; Pekala, R.W. Lawrence Livermore National Lab., CA (United States). 4 Nov 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930571–12: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93013431. Source: OSTI; NTIS; GPO Dep.

The Aerocapacitor is an electrochemical double-layer energy-storage device that utilizes carbon aerogels as electrodes. In this paper, the effect of 1M electrolyte composition on the Aerocapacitor's average-integral (AIC) and differential capacitance is investigated. The AIC values range from 7.2 to 22.5 F/cc for the electrode formulation used in this study. Typically, the AIC increase by a factor of two, and the differential capacitance by a factor of four, between 0 and 1.2 V.

Argonne National Laboratory's Analysis & Diagnostic Laboratory (ADL) tests advanced batteries under simulated electric and hybrid vehicle operating conditions. The ADL facilities also include a post-test analysis laboratory to determine, in a protected atmosphere if needed, component compositional changes and failure mechanisms. The ADL provides a common basis for battery performance characterization and life evaluations with unbiased application of tests and analyses. The battery evaluations and post-test examinations help identify factors that limit system performance and life, and the most-promising R&D approaches for overcoming these limitations. Since 1991, performance characterizations and/or life evaluations have been conducted on eight battery technologies (Na/S, Li/S, Zn/Br, Ni/MH, Ni/Zn, Ni/Cd, Ni/Fe, and lead-acid). These evaluations were performed for the Department of Energy's. Office of Transportation Technologies, Electric and Hybrid Propulsion Division (DOE/OTT/EHP), and Electric Power Research Institute (EPRI) Transportation Program. The results obtained are discussed.

23695 (CONF-921275–, pp. 133-134) **Heat generating behavior of lithium batteries using ARC.** Okawa, S. (Mitsubishi Petrochemical Co.Ltd., Tokyo (Japan)); Arakawa, Y.; Hasegawa, K. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Heat related troubles occurred in 1989 in lithium batteries used in electronic devices, of which cause was attributed to internal short circuits due to defects in manufacturing processes. Heat generation should have been another cause that occurred from solute of the electrolyte which was lithium perchlorate and developed strong oxidative reaction. Since then, lithium trifluoromethane sulfonate that is considered weaker in reactivity has been used. Accordingly, this paper describes a discussion on heat generating behaviors of these two electrolytes from the safety viewpoint, using an ARC which is suitable for measuring spontaneous heat generation under a heat insulated condition. The result may be summarized as follows: Under presence of an electrode, the electrolyte and its organic solvent generated too much heat to be disregarded; the heat generation starting temperature shifted to lower side, a risk increasing direction; and the electrolyte solvent alone could have a risk of heat generation as a result of reacting with the electrode, but the risk would increase with LiClO4 and decrease with LiCF3SO3 conversely. 2 figs., 1 tab.

23696 (NEI-DK–1177) **Thin solid electrolytes on reactive anodes: Final report.** Mogensen, M. Risoe National Lab., Roskilde (Denmark). Materials Dept. Jan 1993. 105p. (In Danish). Contract EM-1443/86-1;Contract EM-1443/87-1. Order Number DE93794743. Source: OSTI; NTIS.

EFP-86; EFP-87.

A short summary of the results of research work carried out at Risoe National Laboratory related to the thin solid electrolytes which are formed on reactive anodes followed by nine appendices comprising the scientific publications produced in this relation, a collection of data and a popular article on the results. The aim of this research was to provide a general description of solid electrolytes which are spontaneously formed on lithium anodes when they are exposed to floating cathodes such as $SOCl_2$. The methods used for characterization were impedance spectroscopy and scanning electron microscopy. It was found that the most important parameter was the relation between the electron and the lithium ion conducting property. and that this could be determined by the

measurements taken. It was found that when lithium is exposed to $SOCl_2$, within a fraction of a second a thick primary layer of LiCl film is formed. This is filled with a number of impurities and appears to have a conducting property which causes a slow self-discharging of the anode in the beginning while the dissolved LiCl is formed in the catholyte. After this the LiCl begins to precipitate as whole pure LiCl crystals (the secondary LiCl layer). This reduces the speed of the self-discharge but finally chokes the battery because the inner resistance becomes too great. It was shown that the speed of growth can be controlled in the beginning (for a number of years) but finally the anode becomes passive. It is concluded that it is the formation and growth of the secondary layer of LiCl which determines the Li-$SOCl_2$ battery's service life. (AB) (24 refs.).

23697 (UCRL-JC–109422) **Feasibility assessment of electromechanical batteries for electric vehicles.** Comfort, W.J.; Bumpas, S.E.; Edmunds, T.A.; Hall, A.R.; Lamont, A.D.; McCue, H.K.; Zywicz, E. Lawrence Livermore National Lab., CA (United States). Feb 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206335–4: International symposium on automotive technology and automation, Florence (Italy), 1-5 Jun 1992). Order Number DE93013083. Source: OSTI; NTIS; GPO Dep.

The authors have assessed the current feasibility of substituting multi-shell composite flywheel motor-generators (electromechanical batteries) for electrochemical batteries in electric vehicles. We present two conceptual designs using the latest materials and technology. Feasibility was evaluated in terms of performance predictions based upon consistent and optimistic analytical models of components of these conceptual designs. The most challenging issues are capital cost and energy storage performance. Energy storage per unit cost favors the electrochemical battery. The power density, specific power, efficiency, and turn-around efficiency can be higher for the electromechanical battery than for projected electrochemical batteries of the future. We conclude that for electric vehicles, electromechanical batteries may be best suited for a hybrid application with electrochemical batteries. This combines the high specific power, power density, and turn-around efficiency possible with the electromechanical battery and the low cost of the electrochemical battery.

29 ENERGY PLANNING AND POLICY

23698 (ANL/ESD/TM–45) **Governmental structure of the Russian Federation with respect to environmental and energy programs.** Colangelo, R.V. (Environmental Planning Group, Inc., Elk Grove Village, IL (United States)); Reistroffer, E.L.; Edgar, D.E. Argonne National Lab., IL (United States). Energy Systems Div. Sep 1992. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93013499. Source: OSTI; NTIS; GPO Dep.

An investigation was conducted by the Environmental Planning Group, Inc., to provide an overview of the structure of government environmental and energy programs in the Russian Federation. The investigation was undertaken to provide a baseline of information to the US Department of Energy (DOE), so that technologies applicable to DOE environmental restoration and monitoring programs can be identified, tested, and transferred. Data for the report were collected through a network of Russian and American sources knowledgeable about environmental and energy programs in the Russian Federation. Sources of information included both US and Russian government personnel, nongovernmental organizations, private consultants, and experts from the academic and scientific communities. The peculiarities of the Union of Soviet Socialist Republics (USSR) remain prevalent in the structure of the Newly Independent States, especially in Russia. The legacy of communism is visible in all aspects of society, most particularly in the extreme environmental degradation that has resulted from careless central planning and policies of forced industrialization. Reforms initiated under Mikhail Gorbachev during the period of Perestroika were aimed at shifting power from the party to the respective government organs. In 1992 the Commonwealth of Independent States was created, joining 11 of the 15 republics into a loose federation. The investigation undertaken by the Environmental Planning Group, Inc., focused on the executive organs of the present Russian government in an effort to define key ministries with environmental and energy responsibilities. The structure of the Ministry of Ecology and Natural Resources (Minpriroda) and the Ministry of Atomic Power (Minatom) are presented. The Academy of Sciences and other ministries that have relevance to the transfer of technologies are discussed, as well as research institutions in which technologies appropriate to DOE programs are likely to reside.

23699 (DOE–76-45/6-Rev.1) **Training as related to behavioral change: Revision 1.** Nertney, R.J.; Buys, J.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). System Safety Development Center. Jan 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (SSDC–6-Rev.1). Order Number DE93013700. Source: OSTI; NTIS; GPO Dep.

This guide provides a basis for upgrading safety training programs and is based on the MORT philosophy of systemic upgrade and repair. It attempts to change the old reactive approach to accidents and events: "If we tell or train people one more time, it won't happen again and everything will be all right." The ultimate objective of training programs is to change behavior of people. Many factors beyond our control influence human behavior on the job. Training elements must not be considered out of context. Behavioral changes may not occur due to emotional physiological sociological environmental, or managerial reasons. Once dominant factors have been identified it is possible to recognize problems and make effective changes. Training will ordinarily provide an effective solution to a behavioral problem only if the following conditions are met: Skill deficiencies are involved; performance is LTA now and has been in the past. It is possible to reach the desired optimum safety only if these conditions are met: Training is specifically targeted on priority safety problems; Safety problems are sensitive to training; Elements of training programs are coherent and mutually consistent; Training programs are consistent with communications to the trainees from other sources; Desired behavioral changes are logically related to existing individual and organizational attitudes. Efforts to alter human stereotype behavior will likely result in high error frequencies. The old behavior is likely to recur under stressful conditions.

23700 (DOE/AD–0009) **Disaster Recovery Program guideline.** USDOE Office of Administration and Human Resource Management, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight. Jul 1991. 207p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93011822. Source: OSTI; NTIS; GPO Dep.

Business and government are dependent upon automatic data processing (ADP) to perform their missions and cannot afford to be without total, or possibly even partial, ADP capability for extended periods of time. The dependency on ADP and the large capital investment organizations are making in ADP equipment and services make implementation of a Disaster Recovery Program, with associated Continuity of Operations and Contingency Plans, essential based on a risk assessment. An effective Disaster Recovery Program can mitigate the losses from a disaster, reduce the amount of time that a customer or user is without mission-essential ADP support, and decrease the time necessary for restoration of normal ADP operations.

23701 (DOE/CE/90053–T44) **[Interagency Advanced Power Group Steering Group meeting minutes].** Hanst, J.W. Horizon Data Corp., Reston, VA (United States). Power Information Center. 21 May 1993. 24p. Subjects presented in this report include working group and panel reports, PIC status report, old business, new business, and IAPG policies and procedures. (JDB)

23702 (DOE/EIA–0437(91)/2) **Financial statistics of major publicly owned electric utilities, 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 31 Mar 1993. 427p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93011468. Source: OSTI; NTIS; INIS; GPO Dep.

The Financial Statistics of Major Publicly Owned Electric Utilities publication presents summary and detailed financial accounting data on the publicly owned electric utilities. The objective of the publication is to provide Federal and State governments, industry, and the general public with data that can be used for policymaking and decisionmaking purposes relating to publicly owned electric utility issues.

23703 (DOE-STD–1021-93) **Natural phenomena hazards performance categorization guidelines for structures, systems, and components.** USDOE, Washington, DC (United States). Jul 1993. 5p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93015087. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) requires in DOE 5480.23 the use of a "graded approach" in performing safety analysis and evaluation of DOE facilities for normal operating and accident conditions, including accidents caused by natural phenomena hazard (NPH) events. DOE 5480.28 uses this graded approach and requires, for the purpose of NPH design and evaluation, placing the structures, systems, and components (SSCs) comprising the DOE facilities into five performance categories. This standard is a revision to DOE-STD-1021-92, December 1992, and provides guidelines to be used for such categorization of SSCs, and recommends systematic procedures to implement these guidelines. It applies to all DOE facilities that are covered by DOE 5480.28. (JDB)

23704 (DOE-STD–1031-92) **Guide to good practices for communications.** USDOE, Washington, DC (United States). Dec 1992. 23p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014732. Source: OSTI; NTIS; GPO Dep.

23710 (DOE-STD–1056-93) **Guide to good practices for line and training manager activities related to training.** USDOE, Washington, DC (United States). Feb 1993. 30p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012878. Source: OSTI; NTIS; GPO Dep.

Training provides personnel with the knowledge and skills necessary to perform their jobs safely, effectively, and efficiently with minimal supervision. Excellence in training and qualification is particularly important in the industry where adherence to proper work practices and procedures is essential to public health and safety. To achieve this, facility personnel should be fully involved and accountable for their contribution to the success of their facility. Line and training managers share the responsibility of ensuring that all training programs are effective. Periodic observation of training and qualification programs by line managers is essential to this effort. These line managers include appropriate levels of involvement by the reactor or nuclear facility manager, the plant manager, the line manager, and others in the line organization as needed. Interest in personnel training and qualification by senior management, including an occasional visit to the training classroom, laboratory, simulator, or on-the-job should be used to reinforce the importance of training, qualification, and line manager involvement. Communications between line and training managers will aid in establishing the relationship necessary between the facility and training organization to achieve the training goals.

23711 (DOE-STD–1057-93) **Guide to good practices for the selection, training, and qualification of shift technical advisors.** USDOE, Washington, DC (United States). Feb 1993. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012980. Source: OSTI; NTIS; GPO Dep.

The DOE Guide to Good Practices For The Selection, Training, and Qualification of Shift Technical Advisors can be used by any DOE nuclear facility that has implemented the shift technical advisor position. DOE Order 5480-20, "Personnel Selection, Qualification, Training, and Staffing Requirements at DOE Reactor and Non-Reactor Nuclear Facilities," states that only Category A reactors must use shift technical advisor position. However, many DOE nuclear facilities have implemented the shift technical advisor position to provide independent on-shift technical advice and counsel to the shift operating personnel to help determine cause and mitigation of facility accidents. Those DOE nuclear facilities that have implemented or are going to implement the shift technical advisor position will find this guide useful. This guide addresses areas that may be covered by other training programs. In these cases, it is unnecessary (and undesirable) to duplicate these areas in the STA training program as long as the specific skills and knowledge essential for STAs are addressed. The guide is presented based on the premise that the trainee has not completed any facility-specific training other than general employee training.

23712 (DOE-STD–1058-93) **Guide to good practices for developing and conducting case studies.** USDOE, Washington, DC (United States). Feb 1993. 44p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012982. Source: OSTI; NTIS; GPO Dep.

Learning from experience is often very costly to a facility: in terms of injured personnel, damaged equipment, and wasted manhours. Learning from the experience gained at the facility and from industry can prevent repeating costly mistakes. This guide contains a method for teaming from experience to prevent mistakes from occurring. That method is the case study. This guide describes how to develop and present case studies. This guide should give the instructional developer some ideas on the best kind of case study to use as well as providing examples of the various types of case studies. Training on industry and inhouse operating experiences should occur throughout the training program to help prevent recurring unsafe events and to curb dangerous trends. Experiences from the facility or from other industries should be incorporated in a manner that is systematic and timely in conveying useful information. Case studies provide a means to organize this information and present it to the trainees in a systematic way. By having trainees analyze and discuss case studies, the Teaming experience is accelerated because the trainees are actively involved in the learning process.

23713 (DOE-STD–1059-93) **Guide to good practices for maintenance supervisor selection and development.** USDOE, Washington, DC (United States). Feb 1993. 54p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012981. Source: OSTI; NTIS; GPO Dep.

This guide has been developed based on functional responsibilities typical of the electrical, mechanical, instrument, and control, maintenance supervisor positions. This guide applies to all levels of maintenance supervision, up to but not including the maintenance manager. The following are included in these guidelines: An assessment and selection process for supervisor candidates; An outline for an initial supervisory training program for the selected candidates to enhance their current skills; An outline for a continuing training program to maintain and improve the abilities of supervisors. Incumbent supervisors should be trained on selected subjects of these guidelines, based on identified needs. When selecting personnel for assignment to the maintenance supervisor position, facility management should compare the candidates' demonstrated leadership, work standards, and analytical abilities, as well as experience, past performance, education, training, and knowledge of the facility, as they relate to the responsibilities of the position. Facility line-managers should select those individuals who have the potential to demonstrate high qualities of leadership, supervision, judgment, motivation, integrity, and professionalism demanded of supervisors within the Department of Energy (DOE) community.

23714 (DOE-STD–1060-93) **Guide to good practices for continuing training.** USDOE, Washington, DC (United States). Feb 1993. 23p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012979. Source: OSTI; NTIS; GPO Dep.

The purpose of this Guide to Good Practices for Continuing Training is to provide contractor training organizations with information and methods useful in the development and implementation of a continuing training program. DOE Order 5480.18A, "Accreditation of Performance-Based Training for Category A Reactors and Nuclear Facilities," and DOE Order 5480.20, "Personnel Selection, Qualification and Training Requirements at DOE Reactor and Nonreactor Nuclear Facilities" Chapter 1, Paragraph 7, require each facility to design and implement a continuing training program. Continuing training is necessary to ensure that facility personnel continually improve their ability to operate and maintain their facility in a safe and reliable manner. Continuing training also should enhance the professionalism of these individuals and should make them aware of the possible consequences of misoperation.

23715 (DOE-STD–1061-93) **Guide to good practices for the selection, training, and qualification of shift supervisors.** USDOE, Washington, DC (United States). Feb 1993. 92p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013954. Source: OSTI; NTIS; GPO Dep.

The purpose of the Department of Energy (DOE) Guide to Good Practices for Selection, Training, and Qualification of Shift Supervisors is to provide DOE contractor organizations with information that can be used to modify existing programs or to develop new programs. DOE contractors should not feel obligated to adopt all parts of this guide. Rather, they can use the information in this guide to develop programs that apply to their facility.

2901 Energy Analysis and Modeling

23716 (DOE/PE/79065–T1) **The National Energy Modeling System: [Final report].** National Academy of Sciences - National Research Council, Washington, DC (United States). 1992. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-90PE79065. Order Number DE93005123. Source: OSTI; NTIS; INIS; GPO Dep.

In response to a request from the US Department of Energy (DOE), in the summer of 1990 the National Research Council (NRC) established the Committee on the National Energy Modeling System (NEMS) to advise DOE and the Energy Information Administration (EIA) on the development and application of a modeling system to support energy policy analysis and strategic planning. As discussed later, this system should have the capability to simulate the effects of various energy policies on US energy supply and demand including economic, environmental and national security impacts. In this report, the committee offers its findings and recommendations on the process of developing a NEMS, the architecture and data needs of the system, and the organizational and management actions that will, in the committee's opinion, help make the system work.

23717 (ETDE-mf–93792574) **System studies on rational energy supply and use of mineralized carbon in the Merseburg region. Final report.** Hebecker, D.; Michalek, K. Technische Hochschule Leuna-Merseburg, Merseburg (Germany). Inst. fuer Technische Thermodynamik und Energiewirtschaft; Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Dec 1991. 42p. (In German). Contract BMFT 13TA0394. Order Number DE93792574. Source: OSTI; NTIS (US Sales Only).

The task consisted of studies in order to continue the exploitation of the salt coal open cut mine Merseburg-Ost and recently to open cast working in Roeglitz in connection with a centralized energy conversation and power-industrial conclusions for the territory of Merseburg. Existing technological variants for the use of salt coal was evaluated. The possible energy concept for the territory of Merseburg was estimated on the basis of existing data and discussions of specialists. The interconnection of energy concept and use of salt coal was investigated with respect to the power-industrial conclusions and options. Under the present conditions the use of salt coal was evaluated as unfavourable, but it is a possible task for the future. (orig.) With 8 refs., 2 tabs., 7 figs.

23718 (DOE/NV/10845–T8) **A gabled wooden lodge in an archaeological context: Archaeological investigations at sample unit U19adPL, Nevada Test Site, Nye County, Nevada.** DuBarton, A.; Drollinger, H.; Edwards, S.; Hemphill, M.; Hockett, B.S.; Johnson, W.G.; King, C.; Beck, C.M.; Pippin, L.C. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. Dec 1992. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93013965. Source: OSTI; NTIS; GPO Dep.

In 1991 the Quaternary Sciences Center at the Desert Research Institute (DRI) conducted archaeological investigations at sample unit U19adPL on Pahute Mesa at the request of the Department of Energy, Nevada Field Office. This work was conducted under the

Long Range Study Plan, a data recovery program designed to intensively study an 11 percent geographic sample of the cultural resources on Pahute and Rainier mesas. The focus of the research was site 26NY3393. This site consists of a gabled wooden lodge with a hearth, a rock ring, and a dim use artifacts scatter of ceramics, lithic tools, and lithic debitage. The structure is the only gabled log structure known on Pahute and Rainier mesas, and associated artifacts included shell and glass beads. Based on temporally diagnostic artifacts, the occupation of site 26NY3393 spans 8000 years. There is no evidence that the site was occupied continuously for any great length of time. It is more likely that Native Americans inhabited the area intermittently on a seasonal basis. The gabled wooden lodge is a late construction, probably dating between A.D. 1760 and 1865. This report documents and presents the results of the archaeological work at sample unit U19adPL.

23719 (ETDE/JP-mf–93793770) **EC unification in confusion and the direction of the European energy market.** Institute of Energy Economics, Tokyo (Japan). 17 Nov 1992. 67p. (In Japanese). Order Number DE93793770. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo,Japan.

This paper describes discussions given on what effect the EC unification would give on the European energy market, and the future outlook. The EC expects price reduction through intensifying competitions in the energy market as a result of introduction of deregulations and TPA (third party access to pipelines and power transmission cables). Nearly all the barriers have been eliminated in the petroleum market. However, in natural gas and electric utility industries, introducing the deregulations appears to be postponed from policies of the countries who regard supply assurance more importantly. In the middle and eastern European countries, expansion of petroleum demand is expected as a result of expanded network with the western European countries, where the Middle East dependence in place of the former Soviet Union would be further elevated. According to the long-term energy demand and supply forecast published by the EC Committee, the natural gas consumption by 2005 is estimated to grow at 3.9% annually, which might face a restriction from supply capacities. This may result in a high possibility of delay in achieving the target of CO2 emission suppression. 30 figs., 55 tabs.

23720 (INIS-mf–13515) **Environmental procedures.** European Bank for Reconstruction and Development, London (United Kingdom). 1992. [99p.] Order Number DE93626450. Source: OSTI; NTIS (US Sales Only); INIS.

The European Bank has pledged in its Agreement to place environmental management at the forefront of its operations to promote sustainable economic development in central and eastern Europe. The Bank's environmental policy is set out in the document titled, Environmental Management: The Bank's Policy Approach. This document, Environmental Procedures, presents the procedures which the European Bank has adopted to implement this policy approach with respect to its operations. The environmental procedures aim to: ensure that throughout the project approval process, those in positions of responsibility for approving projects are aware of the environmental implications of the project, and can take these into account when making decisions; avoid potential liabilities that could undermine the success of a project for its sponsors and the Bank; ensure that environmental costs are estimated along with other costs and liabilities; and identify opportunities for environmental enhancement associated with projects. The review of environmental aspects of projects is conducted by many Bank staff members throughout the project's life. This document defines the responsibilities of the people and groups involved in implementing the environmental procedures. Annexes contain Environmental Management: The Bank's Policy Approach, examples of environmental documentation for the project file and other ancillary information.

23721 (NEI-DK–1153) **Divisia amount and price index for energy consumption.** Skriftserie K. Nationaloekonomisk Institut, 27. Bentzen, J. Handelshoejskolen i Aarhus (Denmark). Nationaloekonomisk Inst. Feb 1993. 29p. (In Danish). Order Number DE93794689. Source: OSTI; NTIS; INIS.

In connection with the calculation of total energy consumption related to aggregation of the individual fuel's combustion values, an alternative to Btu aggregation (combustion value measurement), designated the "Divisia index", is presented. This represents an economic measure for energy consumption. The Divisia index is demonstrated in relation to total national energy consumption and total energy consumption within the Danish housing sector and also with regard to the estimation of price and income elasticity within energy demand. It is only possible to utilize the Divisia index in relation to the last 20 years, which is the period where energy consumption has stagnated. The question of possible irreversible effects on energy consumption caused by large variations in energy prices is discussed. It is suggested that the reaction to a fall in prices is different and less significant than is the case with price rises. In the long term, results point at a reasonably high price elasticity within energy demand. (AB) (22 refs.).

23722 (NEI-DK–1160) **Danish energy taxation in general.** Energistyrelsen, Copenhagen (Denmark). Jan 1993. 7p. Order Number DE93794757. Source: OSTI; NTIS.

This publication is an abbreviated and edited version of the concluding chapter of "Energibeskatningen i Danmark, afgifter som energipolitisk styringsmiddel og energien som beskatningsobjekt" (Energy taxation in Denmark, taxes as an instrument to control energy policy and energy as an object of taxation) by Kjeld Oksberg. (1989).

It is concluded that Fiscal policy resulted in increased energy taxes in Denmark during 1986 which, although meant to be temporary, have since become permanent as a result of energy policy. In the heating sector energy taxes determine choice of fuel and nature of supply. Heavy demands are placed on the administration of taxes where an energy flow between sectors takes place. Taxes have little effect on energy consumption in the domestic sector. Here the environmental impact can also be negative. There is no clearcut environmental policy related to taxation strategy as taxes do not reflect pollution by normal fuels, they have no relation to flue gas cleaning etc. and the principle applied to "shadow taxation" of decentral combined power and heat plants is different from that applied to other types of supply. Taxation based on energy consumption affects those who are economically less privileged. A considerable amount of subsidies are given to cogeneration and natural gas projects and it is suggested that it may also be advisable to support other projects which do not use oil. Financial support of heating plants through taxation is expedient only if a continuous development and adjustment following the effect of taxes on prices is wished for. (AB).

23723 (ORNL/FTR–4233) **[Travel to Gaborone, Botswana to participate in the African Energy Policy Research Network sixth workshop on energy policy and planning research in east and southern African countries]: Foreign trip report, April 6–10, 1992.** Bauer, D. Oak Ridge National Lab., TN (United States). 17 Apr 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011112. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the African Energy Policy Research Network (AFREPREN)-Sixth Workshop on Energy Policy and Planning Research in East and Southern African Countries, and made two presentations: on Integrated Resource Planning (IRP) and modeling and forecasting advances in US utilities. He also served as a resource leader for the AFREPREN theme group concerned with Institutions and Planning, helping that group prepare a two year research program in Energy Policy and Energy Planning in East and Southern Africa. The research program and travel and other costs associated with the workshop are supported by the principal donor of AFREPREN, viz. the Swedish Agency for Research Cooperation with Developing Countries (SAREC), Stockholm, Sweden. The principal focus of the Sixth Workshop was to reorient AFREPREN research emphasis toward environmental concerns and the more efficient use of energy. Previous research emphasis had largely been upon the supply-side. The workshop was valuable to DOE and ORNL in providing an opportunity to broaden the transfer of information and analyses relating to efficiency, IRP, and renewables technologies, to assist African research and public policy leaders to direct research and public policies to utilize energy more efficiently and protect the environment more successfully, and to establish

contacts through whom follow-up cooperative programs in such areas as biomass demonstrations, utility planning and operation, and institutional development may occur.

23724 (UCRL-ID–112336) **The Energy Economics Modeling Project and the Lawrence Laboratories Energy Model.** Altenbach, T.; Lamont, A. Lawrence Livermore National Lab., CA (United States). Nov 1993. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93011715. Source: OSTI; NTIS; GPO Dep.

The Energy Program at Lawrence Livermore National Laboratory has established the Energy Economics Modeling Project to develop economic models of the energy system and use them to address critical national policy questions. The project has developed a new model of the US energy system, known as the Lawrence Laboratories Energy Model (LLEM), and has explored new types of software for building and using energy models. This report summarizes the background and purposes of the Project, and describes the scope, purposes, and status of LLEM.

(Argonne National Lab., IL (United States)); Cheng, J.J.; Zielen, A.J.; Jones, L.G.; LePoire, D.J.; Wang, Y.Y.; Yuan, Y.C.; Loureiro, C.O.; Wallo, A. III; Peterson, H. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930601–16: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93012892. Source: OSTI; NTIS; INIS; GPO Dep.

A microcomputer program called RESRAD, which implements a pathway analysis method for radiological risk assessment, was developed by Argonne National Laboratory (ANL) in 1989. This program is used to derive allowable residual concentrations of radionuclides in soil and to predict effective dose equivalents and excess cancer incidence risks incurred by an individual exposed to radioactive materials. Since its development, the RESRAD code has been adopted by DOE in Order 5400.5 for the derivation of soil cleanup criteria and dose calculations, and it has been used widely by DOE, other agencies, and their contractors. The original models used by ANL to develop RESRAD were initially developed as part of a DOE effort that began in the early 1980s and involved most of the national laboratories and DOE program offices. The RESRAD code is continuously improved and updated to incorporate comments from users and new features that ease the interaction with users and increase the code's capability and flexibility. The DOE Offices of Environmental Guidance and Environmental Restoration also provide periodic guidance regarding any significant changes to the code. The RESRAD update, Version 5.0, has substantial improvements in many aspects compared with the last version released in 1989.

23726 (BNL–48777) **Pilot study risk assessment for selected problems at the Fernald Environmental Management Project (FEMP).** Hamilton, L.D. (Brookhaven National Lab., Upton, NY (United States)); Meinhold, A.F.; Baxter, S.L.; Holtzman, S.; Morris, S.C.; Pardi, R.; Rowe, M.D.; Sun, C.; Anspaugh, L.; Layton, D. Brookhaven National Lab., Upton, NY (United States); Lawrence Livermore National Lab., CA (United States). Mar 1993. 184p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93012535. Source: OSTI; NTIS; INIS; GPO Dep.

Two important environmental problems at the USDOE Fernald Environmental Management Project (FEMP) facility in Fernald, Ohio were studied in this human health risk assessment. The problems studied were radon emissions from the K-65 waste silos, and offsite contamination of ground water with uranium. Waste from the processing of pitchblende ore is stored in the K-65 silos at the FEMP. Radium-226 in the waste decays to radon gas which escapes to the outside atmosphere. The concern is for an increase in lung cancer risk for nearby residents associated with radon exposure. Monitoring data and a gaussian plume transport model were used to develop a source term and predict exposure and risk to fenceline residents, residents within 1 and 5 miles of the silos, and residents of Hamilton and Cincinnati, Ohio. Two release scenarios were studied: the routine release of radon from the silos and an accidental loss of one silo dome integrity. Exposure parameters and risk factors were described as distributions. Risks associated with natural background radon concentrations were also estimated.

23727 (CFS/OO–46-13/35-1991E, pp. 4-8) **Opening address.** Roberts, J. (Ministry of the Environment, Ottawa, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

An overview is presented of the status of Canada's forest resources and government policy concerning them, and the threat posed by acid rain. In 1981 a downward revision of allowable cut levels has left provinces facing local shortages of wood. To strengthen the forest resource base, a 40% increase in harvest level by 2000 has been endorsed, which amounts to an annual average increase of 1.8%. To accomplish this within the context of sustainable development, fundamental changes in traditional attitudes regarding forest exploitation will be encouraged. By 1987 $130 million/y will be spent for forest renewal and silviculture, compared with $50 million in 1982. To support human resources development, $1 million has been added to support for forestry schools across the country. Additional funding is being allocated to research and development. Acid rain poses the most immediate threat to Canada's forests. Immediate action is necessary to avoid a situation similar to Sweden, with 20,000 dead lakes, or the American states east of the Mississippi, where 18% of lakes and 21% of stream miles show acid damage. A limitation of acid deposition to 20 kg/ha/y should protect stream, lakes and forests. This will require emissions reductions of 50%, and will cost $1 billion annually in Canada and $2.5-4.5 billion annually in the USA.

23728 (CONF-9207203–, pp. 9-15) **Global warming.: Macrometeorology.** Watanuki, K. (The University of Tokyo, Tokyo (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Scenarios to predict the change in average surface temperature were designed by grasping the global surface as a one input versus one output system containing the four state variables which were average air temperature, albedo, infrared absorption ratio and heat capacity, and then, solving differential equations for it. The input energy consists of that from the sun, that by the heat transfer from inside to surface in the earth and that generated by the human activities, while the output energy does of that going out through electromagnetic radiations from the earth. The equilibrated average surface temperature was obtained by solving the equations framed on condition that there was no change in temperature with time. The aspect of heightening in air temperature was obtained by solving the equations with changing the infrared absorption ratio based on several scenarios. Conventional data and certain hypotheses were applied to the relation between the greenhouse effect gas and infrared absorption ratio. The difference in energy between the input to and output from the earth became global warming energy, from which calculation was done to estimate the mass to be dissolved of Antarctic ice and level to be risen of sea surface. If the heat is effectively transferred to both the polar circles and used for the dissolution of ice, occurrence is possible of a sufficient rise in level of sea surface for largely influencing the human society. 2 figs., 1 tab.

23729 (CONF-9207203–, pp. 16-17) **Global advective transport of passive tracers emitted from Japan.** Chiba, M. (Meteorological Research Institute, Tsukuba (Japan)); Yamazaki, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

A global scale advective transport was numerically simulated of passive tracers which were emitted from sources in Japan into the atmosphere by the combustion of fossil fuel, etc. It was hypothesized that the emission rate was constant with time up to the altitude of 300m above the global surface. The wind which was to be a transportation medium was expressed by the values which had been computed in advance every two hours at each of the lattice points by a great cycle circulation model of atmospheric air. Without taking rainfall and other removal processes into consideration, it was also hypothesized that the passive tracers moved completely identically with the air. The spatial distribution was shown as of 20 days after the emission. In case that the initial boundary date was June 4, the emitted passive tracers were advectively transported mostly on the Pacific Ocean but hardly on the southern hemisphere across the equator. In case that the initial boundary date was December 4, the advective transport speed was so high that the transport considerably widened not only into the whole high and medium latitude region of the Northern hemisphere but also to the south-west of Japan. Further, there appeared a high concentration region from the Philippines to the Indian Ocean and the advective transport widened also onto the Southern hemisphere because of a transfer from the lower layer to the upper layer of the troposphere by a very active convection around the above region. 1 fig.

23730 (CONF-9207203–, pp. 18-21) **CO2 emission reduction by global permit trade.** Okada, K. (Central Reserach Institute of Electric Power Industry, Tokyo (Japan)); Yamaji, K.; Nagano, K.; Yamamoto, H.; Osada, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Explanation was done of a CO2 control system which was composed of region-by-region basis measures with CO2-imposed levy, plantation, etc., and international trading in CO2 emission permit. An Edmonds and Reilly's model was utilized to the world energy model with distributing the emission permit to nine regions. The total emission to be worldwidely controlled for the initial term was divided among all the regions into their respective permitted emissions which were to be proportional to their respective population in 2000. The region where the actual emission surpasses the permitted one must either endeavor to reduce the former one or buy an extra permit to offset the surplus emission. On the other hand, the region having an surplus emission permit can make a profit on supplying and selling it to the market. Apart from the CO2 control through the trading in emission permit and other economic measures, introduction was done of plantation which was to absorb, fix and reduce the CO2. Function of adjusting supply and demand operates with international price level for the emission permit based on the curve of supply and demand of that permit in the market. Able to pursue both fair division of responsibility and high efficiency of reduction for the CO2 control, the emission permit market institution, if combined with plantation, functions further as an effective control method. 3 refs., 2 figs.

23731 (CONF-921275–) **Proceedings of the 25th Safety Engineering Study Meeting.** 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. Order Number DE93793904. Source: OSTI; NTIS; Available from Japan Soceity for Safety Engineering, 4-47, Onoecho, Nakaku, Yokohama-shi, Kanagawa, Japan.

Among materials with potential danger such as explosion and runaway reaction, the following are studied: peracetic acid, ammonium perchlorate, sodium azide, silane, fused lithium chloride, TEOS (tetraethoxysilane), nitroanthraquinone, etc. As to theories and mechanisms, described are estimation of a runaway starting temperature by giving it disturbance, the thermal stability evaluation method by ARC, DSC, etc. Concerning industrial disaster prevention, studied are LPG underground tanks, human factors of disaster, marine transport of hazardous materials, pulverized coal with danger of fire/explosion at coal mines. Measuring systems for prevention are also made public such as a fire sensor, a system to grasp fire properties, a telephone answering system. Besides, combustion behaviors, fire plume characteristics, electric spark, impact, friction, etc. are fundametally studied in relationships with disaster.

23732 (CONF-921275–, pp. 15-16) **Reaction in ammonium perchlorate-magnesium-water system.** Nagaishi, T. (Kyushu Sangyo University, Fukuoka (Japan)); Suga, T.; Nakamura, H.; Miyahara, A. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Gas generating reaction was investigated to discuss safety in a mixture system of ammonium perchlorate (AP), Mg and water. The reaction in this mixture system under presence of water is a heat generating reaction composed of 2NH4ClO4 + Mg → 2NH3 + Mg(ClO4)2 + H2 which may result in ignition if the heat is stored. Products are also dangerous. The AP accelerates gas generation. The smaller the Mg grain size, the gas generation amount and velocity increase. Its pH changes rapidly from 5.6 to 11 as soon as the reaction begins. Residues after the reaction included Mg and Mg(OH), and the filtrate included AP and magnesium perchlorate. The AP turns to a weak acid upon hydrolysis and increases gas generation because Mg can dissolve readily with it. When the gas generation lasts for a certain period of time, a reaction occurs to turn the aqueous solution basic, and the Mg dissolution and the gas generation reach a saturation. Other strong acids including NH4 salt also accelerate the gas generation, and the hydrolysis contributes similarly to changing the solution weakly acidic. 2 figs.

23733 (CONF-921276–, pp. 235-238) **Photochemical CO2 reduction using modified titanium oxide catalyst.** Muramatsu, A. (The University of Tokyo, Tokyo (Japan). Faculty of Engineering); Okawa, K.; Hashimoto, K.; Fujishima, A. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

A discussion was given on photochemical CO2 reduction using a titanium oxide catalyst modified by Pd and Cu to cope with the CO2 emission problem. TiO2 is a semiconductor which produces electrons and holes using light with larger energy than that in the band gap, the energy of these electrons being capable of reducing CO2. However, because the reduction potential of water is close to that of CO2, a water solution system has CO2 reduction compete with H2 generation. Accordingly, TiO2 was modified with Pd having large hydrogen overvoltage and Cu having high reduction capability. If a TiO2/Pd catalyst is reduced using a Cu plated catalyst, and CO2 is reduced photochemically using the water solution system, generation of H2 and CH4 is suppressed compared with the case using a catalyst not Cu plated, and C2H4, an organic synthesis starting material is generated. A catalyst with Cu on its surface having been oxidized as a result of long term storage after the Cu plating has lost its catalytic activity. The copper should have worked as a specific site for generating C2H4. 2 refs., 3 figs., 3 tabs.

23734 (DOE/EH–93012807) **Update on EH-23 activities in calendar year 1992.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012807. Source: OSTI; NTIS; GPO Dep.

This report briefly describes the activities undertaken by the DOE Office of Environmental Guidance (EH-23) in Calendar Year (CY) 1992 in seven major areas: (1) regulatory review and analysis, (2) environmental policy and guidance, (3)training, (4) workgroups and committees, (5) environmental regulatory management support, (6) projects and other activities, and (7) special presentations. A list of

selected environmental guidance memoranda and documents distributed by EH-23 in CY 1992 is also included.

23735 (EUR–14715) **Research and technology strategy to help overcome the environmental problems in relation to transport. Resource uses study.** Billings, R. (Environmental Research Unit, Dublin (Ireland)); Crowley, J.; Moran, R. Commission of the European Communities, Luxembourg (Luxembourg). Apr 1992. [159p.] Source: OSTI; NTIS (US Sales Only); INIS.

This report concerns the environmental impact of resource utilization in the transport sector. The first phase of the study involved a dissection of transport into its different modes, its operational components, and its existing patterns of resource usage. The second phase was an investigation of existing environmental impacts. Since in principle a significant environmental impact may occur anywhere along the extraction-to-disposal life cycle of a material, it was necessary to investigate a range of environmental phenomena upstream and downstream from the transport sector, as well as within the sector itself. In this development of a holistic perspective of resource usage, particular attention was paid to depletion, disposal, and re-cycling questions. The third phase involved the examination of possible innovations in transport technology. Of particular interest was the resource usage implications of these innovations, and their potential for ameliorating negative environmental impacts. In the final phase of the study, are addressed questions of the net costs and benefits of the various technologies, and of the most appropriate policy options for the Community.

23736 (LBL–33230) **Economics, ethics, and climate policy.** Howarth, R.B.; Monahan, P.A. Lawrence Berkeley Lab., CA (United States). Nov 1992. 70p. Sponsored by Stockholm Environment Inst. (Sweden). DOE Contract AC03-76SF00098. Order Number DE93015373. Source: OSTI; NTIS; GPO Dep.

Are the costs of greenhouse gas emissions abatement justified by the perceived benefits of sustained climate stability? Do people of the present generation have a moral right to impose climate risks on their descendants in generations to come? This report examines these questions in light of the emergent facts of climate science and their socioeconomic implications. We consider alternative normative criteria for social decision-making with particular emphasis on cost-benefit analysis and the principle of sustainable development. While each framework yields important insights, we argue that the gross uncertainties associated with climate change and the distribution of impacts between present and future generations constrain the usefulness of cost-benefit criteria in evaluating climate policy. If one accepts the ethical proposition that it is morally wrong to impose catastrophic risks on unborn generations when reducing those risks would not noticeably diminish the quality of life of existing persons, a case can be made for concerted policy action to reduce greenhouse gas emissions.

23737 (LBL-PUB–3115) **Guidelines for compliance with the National Environmental Policy Act and the California Environmental Quality Act.** Kielusiak, C. Lawrence Berkeley Lab., CA (United States). Feb 1993. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93010436. Source: OSTI; NTIS; GPO Dep.

The National Environmental Policy Act of 1969 (NEPA) sets forth national policy for the protection of the environment. The NEPA process is intended to help officials of the federal government make decisions that are based on an understanding of environmental consequences, and take actions that protect, restore, and enhance the environment. The California Environmental Quality Act of 1970 (CEQA) is similar to NEPA. The California legislature established CEQA to inform both state and local governmental decision-makers and the public about potential significant environmental effects of proposed activities, to identify ways to avoid or reduce environmental impacts, and to disclose to the public the reasons why a project is approved if significant environmental effects are involved. Lawrence Berkeley Laboratory (LBL), complies with the provisions of both NEPA and CEQA. This document defines the responsibilities and authorities for NEPA/CEQA compliance at LBL.

23738 (NEDO-P–9109) **CO recovery from thermal power generation plants.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 214p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794621. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

As a part of the measures taken against the global warming, developmental trend studies and case studies are made for technologies of power generation, CO2 recovery and treatment of recovered CO2, to find a course of the study of the systems to recover CO2 from thermal power plants. CO2 recovery systems are selected which have high potential in each kind of fuel and each power generation method for a plant with a generating end output of 600,000 kW to be newly constructed in the beginning of 2000, and their energy efficiency, CO2 reduction effects and economical efficiency are evaluated. Chemical/physical CO2 recovery from flue gas and CO2 separation from precombustion gas by steam reforming seem to be promising in LNG combined cycle, pulverized coal-fired, oxygen blown integrated coal gasification combined cycle, air blown integrated coal gasification combined cycle, and reformed methanol thermal power plants. For treatment of the recovered CO2, considered are marine, underground and oil well disposals. At existing thermal plants where kinds of fuel used are specified, recovery from the coal-fired power generation plant which is low in required power per recovery amount is profitable. At newly constructed plants where kinds of fuel used are open to choice, recovery from LNG- and methanol-thermal power generation plants which are low in CO2 emission is profitable.

23739 (NEDO-P–9126) **Analysis on factors affecting energy consumptions and CO2 emissions and their regional and sectoral differences.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 244p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794623. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

A common analyzing method was applied to analyze factors relating to CO2 emission in 15 OECD countries, the former Soviet Union, East European countries, and major 15 countries in developing regions. The analyses performed in each country included those on change in factors for energy consumption and CO2 emission brought about by the oil crises, change in CO2 emission because of slowed-down economic growth, factor change in CO2 emission seen by sectors (manufacturing industries, transportation sector, and power generation) as a result of energy saving and fuel conversion efforts, factor change in CO2 emission from energies thrown into the power generating sector, and factor change in CO2 emission in manufacturing industries. The result showed that the factor change common to CO2 emission patterns in industrialized nations is the suppression in CO2 emission as a result of the economic growth stagnation because of the oil crises and the progress of the energy saving efforts. Introduction of nuclear power in the power generation sector has contributed to reducing CO2 emission in a number of countries. The change due to the oil crises was thought to have led to suppression in CO2 emission. Future problems in suppressing CO2 emission are described. 136 figs., 35 tabs.

23740 (NEI-DK–1149, pp. 112-120) **Potential and barriers in EC-countries for energy production from animal manure.** Breinholt, T. (Danish Energy Agency, Copenhagen (Denmark)). Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). In *Collective biogas plants: European experience in combined manure and waste processing. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

A regional evaluation of which European regions within EC can be viewed as most favourable as regards biogas production from animal manure has been carried out. On the basis of a number of primary and secondary criteria such as livestock density, energy

prices, rules and regulations, farming practices and nitrate load in groundwater, all regions within the EC have been analysed. Weighed values have been attributed to each parameter, and by aggregate value analysis, the most favourable regions in Europe have been identified. Furthermore, the gross energy potential has been computed, and a number of barriers have been identified in each member state. (au).

23741 (ORNL/M–2648) **Environmental Regulatory Update Table, January–February 1993.** Houlberg, L.M.; Hawkins, G.T.; Salk, M.S.; Danford, G.S.; Lewis, E.B. Oak Ridge National Lab., TN (United States). Mar 1993. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009791. Source: OSTI; NTIS; GPO Dep.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated bi-monthly with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

23742 (ORNL/TM–2648/R1) **Environmental Regulatory Update Table, March/April 1993: Revision 1.** Houlberg, L.M.; Hawkins, G.T.; Salk, M.S.; Danford, G.S.; Lewis, E.B. Oak Ridge National Lab., TN (United States). May 1993. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013469. Source: OSTI; NTIS; GPO Dep.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated bimonthly with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

23743 (WHC-SA–1690) **Continuous spectrum analysis: An approach for analyzing alternatives and impacts of potential projects.** Eccleston, C.H. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930523–6: 18. National Association of Environmental Professionals (NAEP) annual conference on current and future priorities for environmental management, Raleigh, NC (United States), 24-26 May 1993). Order Number DE93011358. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site, located in southeastern Washington State, is owned by the US Government and managed by the US Department of Energy, Richland Field Office (RL). Two coal-fired steam plants currently supply steam for various uses in the 200 Areas of the Hanford Site. These steam plants have outlived their usefulness and need to be replaced. A reliable source of steam is needed to support future environmental remediation and waste management activities. The National Environmental Policy Act (NEPA) of 1969, requires that all federal actions must be evaluated before a final decision can be made to pursue a proposed action or one of its alternatives. The NEPA process is expected to begin early in the planning process for a proposed action. Normally, the NEPA process is implemented by first preparing a preliminary engineering study of the proposed action and its alternatives. Once this study has been completed, it provides the data and is used as the basis for preparing an analysis of the potential impacts required under NEPA. Under NEPA, all reasonable alternatives for replacing the current steam supply system must be considered and evaluated. Possible alternatives include renovating the existing steam plants or constructing a new gas-fired boiler to replace the existing plants. Because of its high efficiency, it also appears reasonable that a cogeneration plant could be constructed that would produce both steam and electricity. The alternative of taking no action to replace the existing steam supply system (i.e., no-action) and continuing to operate the existing steam plants must also be analyzed under the NEPA process.

23744 (WSRC-IM–93-017) **Environmental Implementation Plan.** Westinghouse Savannah River Co., Aiken, SC (United States). 15 Mar 1993. 598p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013583. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Environmental Implementation Plan (EIP) is to show the current and future (five years) environmental plans from individual site organizations and divisions, as well as site environmental programs and initiatives which are designed to protect the environment and meet or exceed changing environmental/regulatory requirements. Communicating with site organizations, departments, and committees is essential in making the site's environmental-planning process work. The EIP gives the site the what, when, how, and why for environmental requirements. Through teamwork and proactive planning, a partnership for environmental excellence is formed to achieve the site vision for SRS to become the recognized model for Environmental Excellence in the Department of Energy's Nuclear Weapons Complex.

23745 (DOE/FTR–93011427) **[Travel to Honduras to discuss plans to incorporate renewable energy technologies into rural electrification and water pumping programs]: Foreign trip report, October 28–November 12, 1992.** Harcourt, M.M. II. Sandia National Labs., Albuquerque, NM (United States). 16 Dec 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93011427. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Mr. Max Harcourt visited Tegucigalpa and Roatan Island, Honduras. In Tegucigalpa, he met with the staff of the National Rural Electric Cooperative Association Central American Rural Electrification Support (NRECA/CARES) program, representatives of the US Agency for International Development (US AID) and the United States Peace Corps, members of various Private Development Organizations (PDOs) involved with rural development, electrification and water systems, and with members of the Honduran national utility (ENEE). Discussions with AID and the PDOs centered around AID's water projects in support of the national health program - Salud II - and the possibility of incorporating renewable energy power sources into their project planning. While there was considerable interest, and no institutional obstacles from AID, it remains the decision of each PDO that is receiving funding from Salud II as to how they want to execute their projects. Some, notably APRODIB on the island of Roatan, are using PV; however, others are concentrating on grid-powered systems and have not addressed many remote sites as yet. Discussions with the Peace Corps focused on their institutionalization of photovoltaics promotion as part of their small business sector and plans for installation of up to 3,500 systems in the Tela area over the next five years. Meetings with ENEE involved discussions of their rural electrification plans and what steps might be taken to incorporate renewable energy options into their planning.

23746 (CONF-920791–, pp. 5, Paper 4) **Environmental management technology integration opportunities for industry.** Sink, C. (Dept. of Energy, Washington, DC (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The U.S. Department of Energy's (DOE) Environmental Restoration and Waste Management Office of Technology Development

leads an aggressive national program for applied research, development, demonstration, testing, and evaluation (RDDT&E) to address environmental restoration and waste management technology deficiencies by enhancing technology beyond current capabilities. The objective of this RDDT&E program is to support DOE's 30-year cleanup goal by delivering environmental restoration technologies for faster, better, safer, and cheaper cleanup of DOE sites to bring them into compliance for protecting health, public safety, and the environment. These technologies, once successfully demonstrated in DOE's test beds, are made available for transfer to potential users and commercial markets. Recognizing private industry, university, and other government agency RDDT&E as sources of innovations, Technology Development is committed to working with small businesses and other industry to build public-private sector partnerships. These partnerships serve three purposes. First, they make available to DOE the best available technologies developed externally to evaluate for site cleanup. Second, the partnerships serve as a means to move successfully-demonstrated technologies across the DOE complex. Third, once the technologies have been tested or adapted for DOE's environmental cleanup needs, these partnerships are critical to DOE activities which transfer the technologies to: Environmental management businesses to commercialize marketable products and processes; Sister federal research and development (R&D) agencies for sites cleanup; and State and local agencies for regional economic development initiatives which create new jobs and improve standards of living.

23747 (CONF-920791–, pp. 5, Paper 6) **DOE International Technology Exchange Program (ITEP): Technical integration of sensor technology development.** DuCharme, A.R. (Sandia National Labs., Albuquerque, NM (US)); Silva, R.J.; Bickford, D.F. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

To achieve the goal of remediating waste sites throughout its complex and of bringing its facilities into full compliance by the year 2019, the DOE has established the Office of Environmental Restoration and Waste Management (EM). Within EM, the Office of Technology-Development (OTD) has been created to develop technologies that will support DOE's cleanup goal. The OTD is accelerating remediation technology application by leveraging the expenditure of available funds through international technology development and demonstration projects. These projects will address EM's environmental restoration and waste management needs. For this reason, the OTD has created the International Technology Exchange Program (ITEP) whose primary objective is to effect collaboration among governments, industries, and educational institutions to identify worldwide technologies suitable for this purpose. These technologies should also meet U.S. commercial needs. The ITEP will also serve as a mechanism for transferring technologies developed under DOE sponsorship to U.S. industry for ultimate application in the international arena.

23748 (DOE/ID–10217(93)) **Institutional Plan, FY 1993–1998, Idaho National Engineering Laboratory.** USDOE Idaho Field Office, Idaho Falls, ID (United States). [1993]. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (INEL/MISC–92172). Order Number DE93012172. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the plans and goals of the Idaho National Engineering Laboratory for FY 1993–1998. Areas discussed in this document include: INEL strategic view; initiatives; scientific and technical programs; environmental, safety, and health management, technology transfer, science and math education, and community affairs; human resources; site and facilities; and resource projections.

23749 (LA-SUB–93-46/1) **[Los Alamos National Laboratory industrial applications and technology transfer]: Final report.** Los Alamos National Lab., NM (United States); Los Alamos Economic Development Corp., NM (United States). 30 Sep 1992. 195p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008402. Source: OSTI; NTIS; GPO Dep.

In October 1989, the Los Alamos Economic Development Corporation (LAEDC) entered into a contract with the Industrial Applications office (IAO) of Los Alamos National Laboratory (LANL) whereby the LAEDC was to provide support services to IAO. More specifically, according to the Statement of Work in this contract "The Los Alamos Economic Development Corporation shall assist the Los Alamos National Laboratory Industrial Applications Office in establishing and strengthening connections between potential entrepreneurs at the Laboratory and the business assistance community throughout New Mexico, directed toward enhancing the number, of successful start up businesses spinning off the Laboratory's technology base." As part of this contract and subsequent modifications thereof, the LAEDC was to perform seven tasks: 1. Provide business planning assistance to potential entrepreneurs. 2. (Assist IAO in preparing and distributing) informational materials on technology transfer. 3. (Organize and manage) meetings and seminars on technology transfer and entrepreneurship. 4. Identify new opportunities for technology transfer. 5. (Identify and implement programs for the) recognition of Laboratory Entrepreneurs. 6. Training Lab personnel, in the area of technology transfer and Laboratory industrial interactions. 7. Review and summarize prior New Mexico economic development studies. The purpose of this report, is to summarize the accomplishments of the LAEDC under its contract with IAO, and to fulfill its reporting requirements. This report covers the period from October 1989 to September 1992.

23750 (LA-SUB–93-46/2) **[Los Alamos National Laboratory industrial applications and technology transfer]: Annual report, [October 1990–September 1991].** Los Alamos National Lab., NM (United States); Los Alamos Economic Development Corp., NM (United States). 31 Oct 1991. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008403. Source: OSTI; NTIS; GPO Dep.

This report summarizes the accomplishments of the Los Alamos Economic Development Corporation (LAEDC) under its contract with the Industrial Applications Office (IAO). The LAEDC has: provided business planning assistance to potential entrepreneurs, assisted IAO in preparing and distributing informational materials on technology, organized and managed meetings and seminars on technology transfer and entrepreneurship, identified new opportunities for technology transfer, and identified and implemented programs for the recognition of Laboratory entrepreneurs.

23751 (NEI-DK–1149, pp. 166-170) **Financing possibilities and programmes concerning biogas in the Netherlands.** Braber, K.J. (NOVEM B.V., Utrecht (Netherlands)). Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). In *Collective biogas plants: European experience in combined manure and waste processing. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

An overview is presented of existing programmes dealing with manure treatment and anaerobic digestion in general and manure digestion more specifically. Furthermore, the Dutch situation with respect to financing investment projects is outlined. Finally, a preview of possible future programmes and financing opportunities is given. (AB).

23752 (NEI-FI–207) **Research overview 1990-1991.** National Board of Waters and the Environment, Helsinki (Finland). Water and Environment Research Inst. 1992. 16p. Order Number DE93794797. Source: OSTI; NTIS.

According to the 1986 Act of the Finnish Water and Environment Administration the NBWE and the WERI carry out environmental research and monitor the quality of the environment, especially of waters and develop and maintain information systems in this field. In recent years the WERI has actively expanded its range of expertise. Presently the research of the WERI covers most aspects of water research. New rapidly developing areas include waste and

chemicals research and conservation ecology. The research field of the WERi is classified into some 20 problem-oriented smaller research areas which in toll include 180 research projects. The monitoring programme of the institute, revised every second year, includes the following topics: hydrological monitoring, water quality monitoring, monitoring of bio-accumulation of toxic chemicals, integrated and terrestrial monitoring and data banks. The annual research programme of the institute covers areas such as climatic change and airborne pollution, hydrological analyses and models, water quality, toxic chemicals, groundwater, industrial and municipal pollution control, non-point pollution from agriculture and forestry, conservation ecology and development and standardization of methods. The research results are published in international journals and in the Publications of the Water and Environment Research Institute.

23753 (PNL-SA–22022) **The AMTEX Partnership.** Lemon, D.K. Pacific Northwest Lab., Richland, WA (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009816. Source: OSTI; NTIS; GPO Dep.

The American Textile Partnership, as its name implies, is a collaborative effort between the DOE national labs and industry-related R&D/educational institutions. The purpose of AMTEX is to promote R&D that enhance the competitiveness of the integrated textile industry (i.e., fibers, textiles, sewn/fabricated products). The industry-related organizations bring a vital perspective of industry needs in addition to their own R&D capabilities. The DOE labs bring broad R&D capabilities and perspectives from other areas of research application. The strong synergy between industry and DOE will enable this collaboration to significantly impact industry competitiveness while focusing and strengthening, the labs' capabilities consistent with DOE's mission. There are three main components in AMTEX: DOE/ER oversight; the Operating Committee, which is composed a Laboratory Board and an Industry Board; and five Technology Area Coordination Teams (TACTs).

23754 (SAND–93-1003) **Testing technology: A Sandia technology bulletin.** Goetsch, B.; Floyd, H.L.; Doran, L. (eds.). Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013080. Source: OSTI; NTIS; GPO Dep.

This bulletin presents state of the art testing technology utilized at Sandia National Laboratory. A hand-held NiCad battery tester automatically checks batteries of individual cells. Modal analysis shows the way to better process control for integrated circuit lithography. An ultrasonic system pings reentry vehicles to measure in-flight ablation. A smaller VISAR shines in detonator tests. Higher image quality is achieved at neutron radiography facility with the use of a neutron collimator.

23755 (DOE-STD–1050-93) **Guideline to good practices for planning, scheduling, and coordination of maintenance at DOE nuclear facilities.** USDOE, Washington, DC (United States). Mar 1993. 61p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014266. Source: OSTI; NTIS; GPO Dep.

The purpose of the Guideline to Good Practices for Planning, Scheduling, and Coordination of Maintenance at DOE Nuclear Facilities is to provide contractor maintenance organizations with information that may be used for the development and implementation of a rigorously controlled maintenance program directed at planning, scheduling, and coordinating work packages for maintenance tasks at DOE nuclear facilities. This document is intended to be an example guideline for the implementation of DOE Order 4330.4A, Maintenance Management Program, Chapter II, Element 6. DOE contractors should not feel obligated to adopt all parts of this guide. Rather, they should use the information contained herein as a guide for developing maintenance programs that are applicable to their facility.

23756 (DOE-STD–1051-93) **Guideline to good practices for maintenance organization and administration at DOE nuclear facilities.** USDOE, Washington, DC (United States). Mar 1993. 66p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013951. Source: OSTI; NTIS; GPO Dep.

The purpose of the Guideline to Good Practices for Maintenance Organization and Administration at DOE Nuclear Facilities is to provide contractor maintenance organizations with information that may be used to verify adequacy of and/or modify existing maintenance organization programs, or to develop new programs. This document is intended to be an example guideline for the implementation of DOE Order 4330.4A, Maintenance Management Program, Chapter 2, Element 1. DOE contractors should not feel obligated to adopt all parts of this guide. Rather, they should use the information contained herein as a guide for developing programs that are applicable to their facility.

23757 (DOE-STD–1052-93) **Guideline to good practices for types of maintenance activities at DOE nuclear facilities.** USDOE, Washington, DC (United States). Mar 1993. 108p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014267. Source: OSTI; NTIS; GPO Dep.

The purpose of the Guideline to Good Practices for Types of Maintenance at DOE Nuclear Facilities is to provide contractor maintenance organizations with information that may be used for the development and implementation of a properly balanced corrective, preventive and predictive maintenance program at DOE nuclear facilities. This document is intended to be an example guideline for the implementation of DOE Order 4330.4A, Maintenance Management Program, Chapter II, Element 4. DOE contractors should not feel obligated to adopt all parts of this guide. Rather, they should use the information contained herein as a guide for developing maintenance programs that are applicable to their facility.

23758 (DOE-STD–1053-93) **Guideline to good practices for control of maintenance activities at DOE nuclear facilities.** USDOE, Washington, DC (United States). Mar 1993. 36p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014268. Source: OSTI; NTIS; GPO Dep.

The purpose of the Guideline to Good Practices for Control of Maintenance Activities at DOE Nuclear Facilities is to provide contractor maintenance organizations with information that may be used for the development and implementation of a rigorously controlled maintenance program directed at achieving high quality work performance, personnel safety, radiological protection, operating equipment/system protection, and overall site safety and reliability at DOE nuclear facilities. This document is intended to be an example guideline for the implementation of DOE Order 4330.4A, Maintenance Management Program, Chapter II, Element 7. DOE contractors should not feel obligated to adopt all parts of this guide. Rather, they should use the information contained herein as a guide for developing maintenance programs that are applicable to their facility.

23759 (DOE-STD–1054-93) **Guideline to good practices for control and calibration of measuring and test equipment (M&TE) at DOE nuclear facilities.** USDOE, Washington, DC (United States). Mar 1993. 34p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013952. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Guideline to Good Practices for Control and Calibration of Measuring and Test Equipment (M&TE) at DOE Nuclear Facilities is to provide contractor maintenance organizations with information that may be used for the development and implementation of a rigorously controlled maintenance program directed at controlling and calibrating M&TE used for maintenance tasks at DOE nuclear facilities. This document is intended to be an example guideline for the implementation of DOE Order 4330.4A, Maintenance Management Program, Chapter II, Element 11. DOE contractors should not feel obligated to adopt all parts of this guide. Rather, they should use the information contained herein as a guide for developing an M&TE program applicable to their facility.

23760 (DOE-STD–1055-93) **Guideline to good practices for maintenance management involvement at DOE nuclear facilities.** USDOE, Washington, DC (United States). Mar 1993. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013953. Source: OSTI; NTIS; GPO Dep.

The purpose of the Guideline to Good Practices for Maintenance Management Involvement at DOE Nuclear Facilities is to provide contractor maintenance organizations with information that may be used to verify adequacy of and/or modify existing maintenance management programs, or to develop new programs. This document is intended to be an example guideline for the implementation of DOE Order 4330.4A, Maintenance Management Program, Chapter 2, Elements 14 and 16. DOE contractors should not feel obligated to adopt all parts of this guide. Rather, they should use the information contained herein as a guide for developing maintenance management programs that are applicable to their facility.

Functional organization charts for the US Nuclear Regulatory Commission offices, divisions, and branches are presented.

23762 (SAND–93-1152C) **INMM International Safeguards Division status report.** Sonnier, C.S. (Sandia National Labs., Albuquerque, NM (United States)); Case, R.S.; Ek, P. Sandia National Labs., Albuquerque, NM (United States). 28 Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930533–3: 15. annual symposium of the European Safeguards Research and Development Association: safeguards and nuclear materials management, Rome (Italy), 11-13 May 1993). Order Number DE93013769. Source: OSTI; NTIS; GPO Dep.

In July 1990 the Institute of Nuclear Materials Management (INMM) "International Safeguards Subcommittee", an arm of the INMM "Safeguards Committee", held its first meeting, which was devoted principally to organizational matters. The goal of this organization is to promote International Safeguards as a major tool of Non Proliferation policies. Within the framework of the INMM, it has the responsibility to provide a forum for exchange of information related to further development of selected aspects of International Safeguards, and to enhance a broader understanding of these topics. A second meeting of this "Subcommittee" was held at the 1991 INMM Annual Meeting. In November 1991, the INMM reorganized into "Divisions", with the establishment of the "International Safeguards and Non Proliferation Division" (IS&NP). From November 1991, the IS&NP Division met two times, once in Europe and once in the USA. In October 1992, further reorganization of the INMM led to establishment of the "International Safeguards Division" (ISD) which, under the new designation, has met two times, once in Europe and once in Japan. This paper presents the purpose, objectives, results of past meetings, and future plans of the ISD.

This paper summarizes the results of a survey of utility and state demand-side management (DSM) programs that address efficient motor systems. The paper discusses the incentive structures in place at both the state and utility levels to encourage efficient motor systems, and the market barriers associated with implementation of efficient motor equipment. The paper also assesses how the current incentives might address the market barriers to the implementation of efficient motor systems.

23765 (NREL/TP–461-4857) **Trends in public perceptions and preferences on energy and environmental policy.** Farhar, B.C. National Renewable Energy Lab., Golden, CO (United States). Feb 1993. 417p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000069. Source: OSTI; NTIS; GPO Dep.

This report presents selected results from a secondary analysis of public opinion surveys, taken at the national and state/local levels, relevant to energy and environmental policy choices. The data base used in the analysis includes about 2000 items from nearly 600 separate surveys conducted between 1979 and 1992. Answers to word-for-word questions were traced over time, permitting trend analysis. Patterns of response were also identified for findings from similarly worded survey items. The analysis identifies changes in public opinion concerning energy during the past 10 to 15 years.

23766 (PNL-SA–22216) **Risk communication in environmental restoration programs.** Bradbury, J.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304130–1: The risk assessment paradigm after ten years, Dayton, OH (United States), 5-8 Apr 1993). Order Number DE93013286. Source: OSTI; NTIS; GPO Dep.

The author advocates adoption of a convergence model in place of the traditional source-receiver model of communication for communicating with members of the public who have a stake in remediation of a nearby site. The source-receiver model conceives of communication as the transmission of a message from a risk management agency (sender) to a target audience of the public (receivers). The underlying theme is that the sender intends to change the perception of the receiver of either the issue or the sender of information. The theme may be appropriate for health campaigns which seek to change public behavior; however, the author draws on her experience at a DOE site undergoing remediation to illustrate why the convergence model is more appropriate in the context of cleanup. This alternative model focuses on the Latin derivation of communication as sharing or making common to many, i.e., as involving a relationship between participants who engage in a process of communication. The focus appears to be consistent with recently issued DOE policy that calls for involving the public in identifying issues and problems and in formulating and evaluating decision alternatives in cleanup. By emphasizing context, process and participants, as opposed to senders and receivers, the model identifies key issues to address in facilitating consensus concerning the risks of cleanup. Similarities between the institutional context of DOE and DOD suggest that a convergence model may also prove to be an appropriate conceptual foundation for risk communication at contaminated DOD sites.

2940 Fossil Fuels

23767 (CONF-9207203–) **Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.** 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. Order Number DE93793523. Source: OSTI; NTIS; Available from The Japan Institute of Energy, 5-4, Sotokanda 6-chome, Chiyoda-ku, Tokyo (Japan).

As for the environmental problem, reported are prediction of depletion of fossil resources and CO2 emissions, and the global permit trade and reduction of CO2 emission, etc. As to natural gas, notice is taken of its inorganic origin and deep gas. Concerning coal structure, studies are made particularly on elucidation of noncovalent interactions and applications to coal utilization. Regarding coal utilization technology, the paper takes up coal-water slurry fuel, coprocessing of coal and bitumen and a residueless coal gasification method, coal gasification, coal gasification combined cycle power generation, and coal pyrolysis. Relating to coke production and utilization, elucidation of process behaviors, improvement of productivity, and development of new carbon materials are described. With respect to new fuels, diverse developments are seen in cellulose, oil sand residues, and synthesis gas. In the session of automobiles and chemistry, emphasis is placed on engine combustion technology and measures against exhaust gas emission. Study for commercialization of fuel cells is also reported.

23768 (CONF-9207203–, pp. 1-8) **Viewpoint on global warming from fossil fuel reserves.: Study subjects for the next century.** Shitaka, Y. (Center for Coal Utilization, Japan, Tokyo (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The issue of global warming caused by CO2 emission is studied in consideration of life cycles of fossil fuels to find the subjects in the 21st century. Annual supply of fossil fuels will increase for the time being, but turn to a decrease with the first half of the 21st century as its peak, because coal cannot make up for substantial declines in petroleum and natural gas. CO2 concentration will have an inflection point during the first half of the next century and afterward indicate a gentle rise till it reaches a peak after 400-500 years from now during which fossil fuels will deplete. Ultimately the concentration will be 800ppm. Anyhow, it is necessary to predict not only an energy outlook only with a steady increase but changes and ultimate values of the CO2 concentration from all the life cycles of fossil fuels. It is the same to the prediction on man's future life and economy. Particularly, it is important to have a basic program which is firm and comprehensive to introduce new energy and non-fossil energy such as nuclear energy, plant resources, geothermal resources and solar energy. Also required is the program to convert the society to the one which is slim in energy and considers the environment important by means of energy conservation and recycling of resources. 7 figs., 1 tab.

2960 Electric Power

23769 (NEI-FI–201) **Strategies for controlled islanding of a regional power producer.** Jyrinsalo, J. Tampere Univ. of Technology (Finland). Dept. of Electrical Engineering. 1991. 100p. (In Finnish). Order Number DE93794777. Source: OSTI; NTIS.

In this study preconditions for islanding and island operation of a regional power producer were searched for. Three municipal electric utilities owning local power generation were studied (Helsinki, Oulu and Tampere). A simulation program written in Tampere University of Technology was utilized. The local subtransmission networks (110 kV) with the connected components were modelled for the simulation studies. By making simulation as well as analytical studies both network operation and protection methods were developed which improve the controllability of the islanding and the island operation. The most essential improvements suggested were a new separation frequency, frequency control by both frequency- and time-coordinated load shedding procedure and voltage control by a proper reactive power compensation strategy. The functioning of both overcurrent and earthfault relays during island operation were also studied. The simulation results were verified with a primary test, comparison calculations and a sensitivity analysis. The results of the study were utilized to outline some basic principles which aid any power producer in planning its islanding scheme. Proposals were also made concerning the national emergency control practices.

2980 Consumption and Utilization

Refer also to citation(s) 23852

23770 (NEI-DK–1145) **Denmark 1900-1991: Energy consumption, GDP and energy prices.** Skriftserie K. Nationaloekonomisk Institut, 25. Bentzen, J. Handelshoejskolen i Aarhus (Denmark). Nationaloekonomisk Inst. Feb 1993. 32p. (In Danish). Order Number DE93794687. Source: OSTI; NTIS.

The aim was to illustrate and generally analyze data for energy consumption and prices in Denmark during the period 1990-1991. In relation to the presented data on gross and net energy consumption the significance of climate correction is discussed and graphs show the effective price of energy. The long-term connection between energy consumption, energy prices and gross domestic product at factor cost is debated. It is demonstrated how the relation between energy, and gross domestic product at factor cost, develops, and the level of domestic supply of energy during the current century is described. It is explained that, up to 1970, energy consumption had increased at an alarming rate which can be related to the national income during that period. Lately, increases have been more gradual, related to high, effective energy prices. It is stated that some influential effects are irreversible, such as improvements in thermal insulation in buildings and technical energy-saving innovations, and because of this even a fall in energy prices will not result in a return to former levels of energy consumption. The possibility of a new energy price shock in the future could excite even more energy saving activities. In the short term it is more difficult to see the relation between energy consumption and national income development, there are so many influential factors, such as gross domestic product, weather, prices and the number of domiciles etc., to take into consideration. But the estimation of long term elasticity of national income and prices rests at anticipated levels. (AB) (24 refs.).

23771 (NEI-DK–1146) **Energy consumption and energy prices: A comparison of the development in 9 OECD lands 1951-1990.** Skriftserie K. Nationaloekonomisk Institut, 26. Bentzen, J. Handelshoejskolen i Aarhus (Denmark). Nationaloekonomisk Inst. Feb 1993. 30p. (In Danish). Order Number DE93794688. Source: OSTI; NTIS; INIS.

Data are presented on energy consumption and energy prices related to a number of OECD (Organisation for Economic Co-operation and Development) lands covering the period 1951-1990. The information sources are described and the development of energy consumption and prices in Denmark are illustrated in relation to these other countries. The energy intensity (the relation between energy consumption and the gross national product) is dealt with. Here it is possible to follow development during the whole post-war period. It is generally understood that Denmark saved large amounts of energy after 1973-74 but, taken over the whole post-war period, savings and decline in energy-gross national product relations are less dramatic compared to conditions in other OECD countries. Energy coefficients or elasticities show the relative rise in consumption compared to the relative rise in gross national product (growth rate). This is shown to be typically unstable and an eventual connection with the amount of energy price increase and/or the growth rate of the national economy is considered. Results of Granger causuality tests on energy consumption, national income and energy prices are presented. Effective energy prices were very low in Denmark up to 1970 when they suddenly began to increase. Since the oil crisis Denmark's energy consumption has

fallen whereas the other countries have used rather more energy than before. Effective promotion of energy savings must be seen in relation to the fact that the 1970 basis level of energy consumption and intensity was unusually high. The high effective energy prices have also encouraged energy savings in Denmark. (AB).

2990 Unconventional Sources and Power Generation

23772 (NEDO-P–9101) **Present situation in new energy related cooperation and its future direction (the U.S.A.).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 61p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794616. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

With an objective of promoting effectively and efficiently the development and introduction of petroleum substituting energies in Japan, this paper describes investigations on how the petroleum substituting energies are developed and introduced in the U.S.A. The U.S. energy strategy was analyzed as to the oil production, nuclear energy, hydraulic power generation, natural gas, and coal. The energy saving measures being discussed include tax deduction on power generation using renewable energy sources including solar energy, and finances for energy efficiency improving plans. The paper also introduces a summary of part of the energy policies adopted in seven countries including Germany, Canada, and Japan. The present situation in the alternative energy industries is described with explanations on the organizations and plans of the renewable energy trade committee (CORECT), an outline of the U.S.'s international cooperation for energies, and four events in the solar energy industry. It is not too much to say that the U.S. energy industry is in a chaos, and it was concluded that the industry is not ready to dedicate itself in international cooperation. 10 tabs.

23773 (NEDO-P–9102) **Present situation in new energy related cooperation and its future direction (Canada).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 78p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794617. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

With an objective of promoting effectively and efficiently the development and introduction of petroleum substituting energies in Japan, this paper describes investigations on how the petroleum substituting energies are developed and introduced in Canada and its international activities. According to the estimation made by the Canadian Energy Department, the consumption rates in different energies would not show a large change during the coming two decades. Efficiency improvement in household room heating and air conditioning is listed first as a measure to reduce the energy demand. According to a calculation, a complete implementation of this measure would reduce the household energy consumption by 45% compared with that in 1989 by 2010. The paper also explains means to reduce illumination power consumption in commercial sectors, energy demand in manufacturing industries, and exhaust gases associated with natural gas production, as well as development plans and international activities on energy efficiencies and alternative energies. It is apparent that Canada gives priorities to expansion of natural gas utilization and power generation using nuclear and hydraulic power to reduce the nation's dependence on petroleum. 16 tabs.

23774 (NEDO–P-9103) **Present situation in new energy related cooperation and its future direction (the United Kingdom).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 50p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794618. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

With an objective of promoting effectively and efficiently the development and introduction of petroleum substituting energies in Japan, this paper describes investigations on policies for petroleum substituting energies, research and development activities, and international cooperation in the U.K. Since the U.K. produces petroleum and natural gas in abundance, its main objective to develop and introduce oil substituting energies is closely related to global environmental problems, the reduction of greenhouse effect gases in particular, rather than assuring energy resources. The Government published a white paper on the environment in 1990, which sets forth a principle of suppressing carbon dioxide emission in 2005 to the level in 1990. High-priority research and development plans include solar energy utilization and development, on which the Government intends to work positively. The nation's international cooperation is based mostly on the framework with the EC countries, where the basic energy policy held up by the EC of environmental protection and energy saving promotion would continue influencing the nation's efforts. 8 figs., 5 tabs.

23775 (NEDO-P–9104) **Present situation in new energy related cooperation and its future direction (France).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 69p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794619. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

With an objective of promoting effectively and efficiently the development and introduction of petroleum substituting energies in Japan, this paper describes results of the investigations on energy policies, the current situation in new energy development, and the international cooperation for the area of new energies in France. The Government announced the 'Energy 2010' in 1990, a governmental guideline for the next two decades. The guideline describes the necessity of more flexible use of the conventional nuclear power emphasizing policy, introduction of alternative fuels into the transportation sector, and advocates introduction of gas and electric vehicles. The paper also shows the results of investigating the energy policies adopted by the French Energy Administration Bureau (AFME) as to the manufacturing industries, raw materials, transportation, biomasses, and new energies. France is thought not placing emphasis on technical researches for new and renewable energies (excluding nuclear energy), and the direction of its nuclear power policy is dependent on the petroleum situation. A consideration is given on the nation's assistance mechanism. 3 figs., 16 tabs.

23776 (NEDO-P–9105) **Present situation in new energy related cooperation and its future direction (Germany).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 99p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93794620. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

With an objective of promoting effectively and efficiently the development and introduction of petroleum substituting energies in Japan, this paper describes results of the investigations on situations around the energy policies and new energies, trends in research and development in oil substituting energies, the actual state of assistance and cooperation to developing countries for new energies, and the international cooperation on EC's new energy technologies in Germany. The German energy policies are being implemented on the basis of shifting to nuclear power generation because of coal cost increase and considering the global environmental problems including greenhouse effect gas problem. Specifically, utilizing renewable energies including solar heat energy and nuclear energy as an alternative energy is advocated. With respect to the assistant cooperation to developing countries,

German investments have reached over 10% of the total aid amount, and were used for more than 100 projects. Majority of the projects are for those related to solar heat energy utilization, particularly the area of photovoltaic cells having been most successful. 4 figs., 7 tabs.

23777 (NEI-DK–1149, pp. 78-91) **The problem of excess manure in the Netherlands: Environment and legislation. Future development and role of biogas production.** Voorburg, J.H. (IMAG-DLO, Wageningen (Netherlands)). Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). In *Collective biogas plants: European experience in combined manure and waste processing. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

The problem of excess manure in the Netherlands is aggravated by the fact that legal measures where taken at a moment when the volume of the surplus exceeded by far the available possibilities for disposal. The problem was approached by a considering policy, reduction of P and N content in animal feed, distribution to arable regions and manure processing. Opinions differ on the possibilities to solve the problem of excess manure in 1995. The impact of manure surpluses is nutrient losses from manure which is considered not to be in excess. Land-spreading in autumn and winter leads to severe N-losses caused by leaching and run-off. High animal density results in a volume of ammonia evaporation which makes the NH_x depostion a main factor related to acid precipitation. Measures to reduce losses in the form of leaching and evaporation are successful. Development has started towards a reduction of the ammonia emission from housing and storage. Dutch farmers became aware of the inefficiency to their management of crop nutrients and aim at an improved nutrient balance. A result of these measures will be a further reduction of the application rate of manure and fertilizers, which means an increase of the manure surplus. The production of biogas is a challenging aspect of manure management. Introduction into the system of manure distribution to arable regions deserves serious consideration. (AB).

23778 (NEI-DK–1149, pp. 122-128) **The value of manure and organic waste: National differences.** Gosch, A. (Fachhochschule Gessen-Friedberg, Biogas-Laboratory for Research and Technology (Germany)). Commission of the European Communities, Brussels (Belgium). Directorate General for Energy; Energy Centre Denmark, Copenhagen (Denmark). 1992. (CONF-9210360–: European seminar on collective biogas plants. European experience in combined manure and waste processing, Herning (Denmark), 22-23 Oct 1992). In *Collective biogas plants: European experience in combined manure and waste processing. Proceedings.* 249p. Order Number DE93794674. Source: OSTI; NTIS.

A THERMIE Programme Action.

The nutrient value of manures as multifertilizers, and the biogas potentials of organic household wastes, are demonstrated by the use of tables. Resources in Germany are illustrated, and two designs for biomass conversion plants are presented in the form of diagrams. (AB).

23781 (ANL/CMT/CP–78930) **Heat and Seed Recovery Technology Project.** Swift, W.M.; Petrick, M.; Natesan, K. Argonne National Lab., IL (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930270–1: MHD contractor's review meeting, Pittsburgh, PA (United States), 2-4 Feb 1993). Order Number DE93009203. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to address technical issues related to both the MHD topping and bottoming cycles and to their integration. Design information will be obtained through modeling and experimentation. This information, together with the insults of long duration testing at DOE's Coal Fired Flow Facility (CFFF) and Component Development and Integration Facility (CDIF), can be used to reliably design the first-generation MHD retrofit plant. Work during the reporting period focused on the following tasks: (1) computer modeling of the integrated topping-cycle power train (combustor/nozzle/channel/diffuser); (2) evaluation of materials for the bottoming steam cycle; (3) systems analysis of an MHD/CO_2 cyde; and (4) the completion of a topical report on the reactivation of the ANL superconducting magnet system. Accomplishments in these areas are described briefly.

23782 (LA–12482-MS) **Advanced magnetic flux compression generator development issues: A comparison of coaxial and disk generators.** Sheppard, M.G.; Freeman, B.L. Three magnetic flux compression generator (FCG) geometries are reviewed and compared for their suitability as high-current, high-power drivers for z-pinch implosion programs at Los Alamos. They are the inside-out coaxial FCG, the disk FCG, and the outside-in coaxial FCG. A wide range of issues is discussed for each type FCG including current-carrying capability current densities, robustness, explosive mass and shape, initiation schemes, efficiency, operating times, complexity, and expense associated with development and fabrication. Equations are derived and used in simple scaling studies. The results of these studies are supported by MHD calculations and references to relevant experiments both here and in Russia. The inside-out coaxial FCG is shown to be suitable, both for the very high current applications and for anticipated future Trailmaster concepts. Based upon this analysis and results reported in the Russian literature, the inside-out coaxial FCG is more suitable than the disk FCG for the high-current applications considered, and the two are roughly equivalent when

applied to lower-current Trailmaster concepts. The outside-in coaxial FCG is unsuitable for either application because of its limited current-carrying capability and the large investment required for initial development.

The present paper describes the trend of research and development of various fuel cells in the Moonlight Project from 1981 up to now. Based on the results obtained until then, development of a 5000kW class power generation plant for Urban Energy Center and a 1000kW class power plant for cogenerator system has been advanced both using phosphate type fuel cells since 1991. One target is to attempt to realize a power plant of up to 1000kW class per one stack by raising current density to 350mA/cm^2 and advancing lamination of cells with an aim of cost reduction and improvement in reliability for promoting the propagation of this type of fuel cell. Concerning fused carbonate type fuel cells, each cell of composite large capacity type stack, modified large capacity type and internally reformed type is being studied aiming at the establishment of a 1000kW class power generation system by 1997. Besides, a developmental study is being forwarded on the solid electrolyte type fuel cell while aiming at realization of several ten kW class modules by 1995 through the development of several kW class modules and the polymer type fuel cell while aiming realization of 1kW class modules. 1 fig.

23784 (CONF-9207203–, pp. 296-299) **Graphic exergy analysis of fuel-cell systems baased on energy-utilization diagrams.** Ishida, M. (Tokyo Institute of Technology, Tokyo (Japan). Research Laboratory of Resources Utilization); Yamamoto, M. 22 Jul 1992. 320p. (In Japanese). Energy Utilization Diagram(EUD) was applied to the fuel-cell system and its usefulness was actually shown by expressing the characteristics on EUD by five parameters. A formula, EXL=δH_{ea} (A_{ed}-A_{ea}) $\geq$ 0, shows the exergy, EXL, given at the time when energy of quality, A_{ed}, is converted to energy of quantity, δ H_{ea}, quality, A_{ea}, (where ed, ea represent energy donor, energy acceptor respectively). According to the diagram of EUD in which energy levels, A and δH_{ea}, are represented by ordinate and abscissa respectively, the electromotive force generated in a fuel cell is expressed in the form of a rectangular area corresponding to exergy loss. It is understood from the case study obtained by inputting actual figures to the PAFC plant of Goi and an imaginary system of SOFC that EUD can be drawn with a small number of data and allows a systematic representation of different phenomena such as reaction system, heat-exchange system and power system. 7 figs., 1 tab.

23785 (CONF-9207203–, pp. 300-304) **Launching toward phosphoric acid fuel cell commercialization.** Matsushita, T. (Toshiba Corp., Tokyo (Japan)); Shiba, Y. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The developmental history of phosphoric acid fuel cell in Japan is reviewed and the tasks and measures in the present condition are described. In the Moonlight Project initiated in 1981, two 1MW demonstration plants and two kinds(for isolated islands, for business use) of on-site 200kW-class power plants were developed by 1991 with their own purposes fulfilled. In the private section also, a 11MW demonstration plant of large scale power started its operation in 1991 and a large number of small-scale on-site tests have been conducted. It can be said that the fuel cell power generation in the section is one step before its commercialization now. Governmental aids for propagation of this power generation system have been covering reconsideration of approval for construction and various regulations for system linking, introduction of tax system, financing and subsidiary beneficial to this system. While the commercialization of the phosphoric acid fuel cell seems to come soon, the present tasks are, above all, reduction of the cost 3-4 times as high as that of usual power generation facilities. Next, there can be listed reliability, compactness, efficient heat utilization, diversification of fuel, etc. 2 figs.

23786 (CONF-9207203–, pp. 305-306) **Fuel cell development in gas industry.** Koga, M. (Japan Gas Association, Tokyo (Japan)); Kitagawa, S. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. Since the fuel cell using natural gas is highly efficient in power generation and superior in adaptability to environment, fuel gas suppliers are active in the development of this technology. This paper describes the present status of this matter in Japan. Concerning the situation of developing, for example, on-site PAFCs, three gas companies and F Electric Company started the joint manufacture of several tens of experimental machines in the classes of 50 - and 100kW in 1992 and will conduct field tests and monitor tests in the sites of customers of each gas company in preparation for commercialization through mass production in 1993. Furthermore, NEDO and three gas companies successfully finished the demonstration test of a 200kW machine installed in Plaza Hotel of Osaka in October of 1991. Demonstration tests of a 500kW machine and a 1000kW machine are being advanced by the joint development of O gas company and F Electric Company and that of NEDO and Phosphoric Acid Fuel Cell Association respectively. The final demonstration test in the latter is scheduled to be done in 1995-1996. 1 fig.

23787 (CONF-9207203–, pp. 307-310) **Development of 25kW class multiple large capacity type molten carbonate fuel cell.** Otsuka, K. (Hitachi, Ltd., Tokyo (Japan)); Kahara, T.; Takashima, S.; Takeuchi, M.; Fujimura, H. 22 Jul 1992. 320p. (In Japanese). MCFC(Molten Carbonate Fuel Cell) is being developed under the principal sponsorship of NEDO within the framework of the Moonlight Project of Agency of Industrial Science and Technology in Japan. This report describes the features of multiple large capacity type MCFC stack and the developmental situation of a 25kW class stack in the project. It is necessary for realization of high output to enlarge the cell area and laminate a plurality of unit cells. Until now, the largest fuel cell in the world was developed which has 1.2m^2 of effective area by arranging four unit cells each having an area of 3,025cm^2. A 25kW class cell which is obtained by laminating 22 multiple large capacity type MCFCs each having an area of 1.2m^2 satisfied the expected purpose in performance tests and will be a prototype for the future. A pressure operation of 5700h was successfully finished, providing hopeful prospect. Efforts will be made for eliminating the scatter among cells and improving performance, reliability and service-life toward 1MW class machine hereafter. 4 figs., 2 tabs.

The waste heat utilization system, heat unit price, etc. in the case where molten carbonate fuel cell power generation is operated as cogeneration system were evaluated and investigated using an office building as model. While electric power, cold heat and hot heat are supplied with power load follow-up operation adopted for office building, a turbo-refrigerator and a hot water boiler were supplemented for additional burning of cold and hot heat. The following results were obtained by simulating a 1MW class and a 20MW class power generation plants, assuming a certain extent of fluctuation of annual electric power and heat demand. Since heat-to-power ratios used in the simulation were not so good, the shares due to additional burning were so high that 65-85% and 45-60% were allotted for cold heat and hot heat respectively and heat supply from fuel cell power generation was small. This system gave about 35-45% energy saving compared with the conventional heat supply system by recovering waste heat as cold heat and hot heat. Scale merit appeared significantly in the case of the 20MW system, being half of the 1MW system. 2 refs., 3 figs., 1 tab.

23789 (CONF-9207203–, pp. 315-316) **Statement for early commercialization of solid oxide fuel cell.** Ipponmatsu, M. (Osaka Gas Co. Ltd., Osaka (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. 'Committee for coal-gasified-fuel cell' of the Japan Society of Energy, inaugurated in January of 1990, started a full-scale discussion on the problem of the relation between effective application of coal and SOCF(Solid Oxide Fuel Cell). The present report describes the tasks for the SOFC system around the results of this discussion. A feasibility study was carried out with respect to a system of Texaco-type coal gasification + Westinghouse-type SOFC + gas turbine + steam turbine. An approach to system optimization in the form of varying fuel utilization rate in the range of 60-80% produced the results of analysis that lowering of fuel utilization rate brings about the rise of overall efficiency. This is because SOFC works in a temperature as high as 1000°C makes a full use of the sensible heat of waste gas; as a result, importance of setting the optimum fuel utilization rate was recognized regarding the system design. 1 tab.

The potential of high temperature Solid Oxide Fuel Cells as high performance, high efficiency energy conversion device is well known. Investigation of several cell designs have been undertaken by various researchers to derive the maximum performance benefit from the device while maintaining a lower cost of production to meet the commercialization cost target. The present investigation focused on the planar SOFC design which allows for the use of mature low cost production processes to be employed. A novel design concept was investigated which allows for improvements in performance through increased interface stability, and lowering of cost through enhanced structural integrity and the use of low cost metal interconnects. The new cell design consisted of a co-sintered porous/dense/porous zirconia layer with the electrode material infiltrated into the porous layers. The two year program conducted by a team involving Ceramatec and the Institute of Gas Technology, culminated in a multi-cell stack test that exhibited high performance. Considerable progress was achieved in the selection of cell components, and establishing and optimizing the cell and stack fabrication parameters. It was shown that the stack components exhibited high conductivities and low creep at the operating temperature. The inter-cell resistive losses were shown to be small through out-of-cell characterization. The source of performance loss was identified to be the anode electrolyte interface. This loss however can be minimized by improving the anode infiltration technique. Manifolding and sealing of the planar devices posed considerable challenge. Even though the open circuit voltage was 250 mV/cell lower than theoretical, the two cell stack had a performance of 300 mA/cm^2 at 0.4V/cell with an area specific resistance of 1 Ω-cm^2/cell. improvements in manifolding are expected to provide much higher performance.

23791 (LA-UR–93-1689) **Electrocatalysis issues in polymer electrolyte fuel cells.** Wilson, M.S.; Derouin, C.R.; Valerio, J.A.; Gottesfeld, S. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Various electrocatalysis issues of impotance to low platinum loading polymer electrolyte fuel cells (PEFCs) are discussed. Thin film catalyst layer assemblies are used to investigate the effects of CO and CO_2 on the anode as well as efforts to restore performance by oxygen bleeding into the anode feedstream. These electrodes behave differently than ionomer-impregnated E-TEK electrodes because the extra, exposed Pt in the latter case. The tolerance of Pt-Ru alloy thin film anodes to CO and CO_2 are also evaluated. Thin film electrodes are also used to study Pt particle growth in aged electrodes as well as particle size effects on specific activity.

EFP-89.

The results of a project carried out by Risoe National Laboratory in cooperation with a Danish commercial company (Haldor Topsoee A/S) are presented in the form of a collection of individual papers already published. The aim of the project was to develop methods of powder preparation and fabrication of the La(Sr)MnO_3 electrode, partly to investigate the oxidation of CH_4 and H_2 on CeO_{2-x} based electrodes and partly to build up equipment for the control of gas flow and measuring of the gas composition. The results of the separate projects are very briefly summarized. (AB).

Baltic Nordic cooperation in the field of energy and environment.

In the independent Estonia an energy crisis is forthcoming or partly already existing reality. The fuel consumption is estimated to decrease by 20-30 % in the scenarios considered by the year 2000. Oil-shale is the most important fuel and almost the sole domestic fuel in Estonia. It, however is a problematic fuel with low calorific value, high ash content implying large environmental problems. In the scenarios considered it has been supposed that no new oil-shale mines will be opened and the consumption of oil-shale will decrease. Only the use of natural gas is estimated to increase clearly. The given fuel consumption scenarios are favourable from the environmental point of view. All calculated emissions (SO_2, NO_x and CO_2) are decreasing. Without ordinary emission reduction measures, the sulfur emissions are estimated to decrease over 30 % from the level of the year 1980 by the year 2000. If the assumed emission reduction plans of the oil-shale plants will be realized, the sulfur emissions will decrease over 60 %. Because there are no reduction plans for nitrogen oxides and carbon dioxide, the decline of emissions of these substances is due to the decreasing energy production. The emissions of nitrogen oxides are estimated to decrease by 10-20 % compared with the emissions of 1987 and those of carbon dioxide by 20-30 % compared with the emissions of 1990.

23796 (AUC-IBT-R–9149) **Modelling complex inlet geometries in CFD - applied to air flow in ventilated rooms.** Indoor Environmental Technology Paper, 21. Skovgaard, M.; Nielsen, P.V. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1991. 17p. (CONF-9109312–4: 12. Air movement and ventilation control (AIVC) within buildings conference, Ottawa (Canada), 24-27 Sep 1991). Order Number DE93794741. Source: OSTI; NTIS.

Modern inlet devices applied in the field of ventilation of rooms are getting more complex in terms of geometry in order to fulfill the occupants' demand for thermal comfort in the room and in order to decrease the energy consumption. This expresses the need for a more precise calculation of the flow field. In order to apply computational fluid dynamics for this purpose it is essential to be able to model the inlet conditions precisely and effectively, in a way which is comprehensible to the manufacturer of inlet devices and in a way which can be coped with by the computer. In this paper a universal method is presented and tested. The method is based upon three-dimensional - and radial wall jet theory and upon diffuser specific experimental data. Simulations are held up against a more basic method and full-scale measurements. The inlet model is evaluated in terms of result, computational effort and applicability. Promising results are obtained. (au) (15 refs.).

23797 (AUC-IBT-R–9150) **Numerical investigation of transitional flow over a backward facing step using a low reynolds number K - ϵ model.** Indoor Environmental Technology Paper, 22. Skovgaard, M.; Nielsen, P.V. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1991. 11p. (CONF-9109312–3: 12. Air movement and ventilation control (AIVC) within buildings conference, Ottawa (Canada), 24-27 Sep 1991). Order Number DE93794740. Source: OSTI; NTIS.

Recent full-scale experiments have detected the presence of low Reynolds' number effects in the flow in a ventilated room. This means that one is unable to predict the flow patterns in some geometries for air change rates - or Reynolds' numbers - which are relevant to ventilation engineering by a standard model of turbulence. In this paper it is investigated if it is possible to simulate and capture some of the low Reynolds number effects numerically using time averaged momentum equations and a low Reynolds number k-ϵ model. The test case is the laminar to turbulent transitional flow over a backward facing step with expansion ratio (h/H = 1/6). The results are evaluated and held up against experimental LDA data and data from a simulation with a Reynolds stress model (RSM). (au) (16 refs.).

23798 (CONF-9209231–2) **Cooling energy performance and installation of a retrofitted exterior insulation and finish system on masonry residences in the southwestern United States.** Ternes, M.P.; Wilkes, K.E.; McLain, H.A. Oak Ridge National Lab., TN (United States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on exterior insulation and finish systems; Arlington, VA (United States); 21-24 Sep 1992. Order Number DE93011844. Source: OSTI; NTIS; GPO Dep.

A field test involving eight single-family houses was performed during the summer of 1991 in Scottsdale, Arizona to evaluate the potential of reducing air-conditioning electricity consumption and demand by insulating their exterior masonry walls using a site-fabricated (non-commercially available) insulation and finish system. The exterior insulation system developed for the field test was easily performed and should result in a durable installation. Total per house costs to perform the installations ranged from $3610 to $4550. The average annual savings was estimated to be 491 kWh, or 9% of pre-retrofit consumption. Peak demands without and with insulation on the hottest day of an average weather year for Phoenix were estimated to be 4.26 and 3.61 kill, for a demand reduction of 0.65 kill (15%). We conclude that exterior masonry wall insulation offers the greatest potential for air-conditioning electricity savings and peak demand reductions in hot, dry climates similar to that of Phoenix. Retrofit economics need to be thoroughly examined from societal, utility, and consumer perspectives and must consider other benefits such as space-heating energy savings and improved house value.

23799 (CONF-921275–, pp. 85-88) **Fire plume characteristics in an area where a vertical down-flow exists.** Oka, Y. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Sukawa, O. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

A vertical laminar air flow type clean room was taken up as an area where an air conditioning down-flow exists, and a fire was assumed to have broken out in such an area to investigate properties of plumes formed over a simulated fire source, especially their horizontal distribution. The experiment was carried out in a room with a floor area of 3.8 m^2 and a ceiling height of 3 m, in which the air conditioning flow is discharged uniformly from the entire surface of the ceiling and sucked into the whole surface of the floor. The down-flow rates were 25 cm/s and 45 cm/s. A circular fire source of 100 mm to 200 mm was installed on the center of a room, and supplied with methanol so that the liquid height is maintained constant during the measurement. Measuring temperatures and heated air rising velocities provided the following findings: The plume over the fire source has spread more horizontally than the plumes in free air spaces, but its horizontal distribution satisfies the Gaussian distribution. The plume temperature range did not agree with the velocity range in a flow field where the air conditioning down-flow exists, but the temperature range has surpassed. 8 refs., 3 figs.

23800 (CONF-921275–, pp. 147-148) **Evaluation on performance of fire property identifying system.** Koseki, D. (Fire Research Institute, Tokyo (Japan)); Sato, K.; Tamura, H.; Hosokawa, M.; Nomura, J.; Kurio, T.; Nakanishi, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

An evaluation was given on non-fire alarm reduction effect of a fire property identifying system, using smoke sensor signals on non-fire alarm data-base collected in buildings. The system consists of a composite sensor integrating smoke, temperature, and CO gas sensors, a person-in-room detection sensor (PIR sensor), and a signal processing device. If event data are input on a non-fire alarm or a pre-alarm due to steam, the system determined the data correctly as steam, and began operation within 60 seconds after a smoke sensor signal output began rising. In the case of a non-fire

alarm or a pre-alarm due to cigarette smoke, the system operated the PIR sensor or automatic telephone call judging the data as cigarette smoke if a person is in the room, and did not issue a non-fire alarm. The system was capable of discriminating 30 cases out of 43 non-fire alarm issuances due to steam and cigarette smoke generated by a hotel and its tenants, except for 13 cases of which cause was not made clear. It was found that non-fire alarms can be eliminated at least at 70%. 4 refs., 3 figs., 2 tabs.

23801 (CONF-921275–, pp. 149-152) **System to identify a person in room at fire using infrared sensor and telephone response system.** Hosokawa, M. (Fire Research Institute, Tokyo (Japan)); Sato, K.; Koseki, D.; Tamura, H.; Okuda, Y.; Kirihata, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

This paper describes a summary and effectiveness of a system to identify a person in a room based on a human body infrared sensor and an automatic telephone response system. The experiment used a sensor installed on a ceiling to measure smoke concentration, temperature, and CO concentration in a flaming fire, a smoking fire on cotton sheets, steam, and cigarette smoke. The system had a fuzzy membership function using an output value from the human body infrared sensor as an input added to the cigarette smoke inferring part in a fuzzy expert system. The effectiveness of the prototype person-in-room identifying system on the fire property identifying system was proved when the system identified accurately smokes from the smoking fire and cigarettes. The telephone response system works in such a manner that if the result of an inference is a fire, the system rings automatically a telephone set in a room where an anomaly has occurred in the sensor level to give an evacuation information to a person in the room. In the event of issuing a non-fire alarm, if presence of an anomaly is responded, the inference result can be changed to a fire. Future development is required of a human body infrared sensor that can identify reliably waver of a flame and movements of human bodies. 5 refs., 7 figs.

23802 (CONF-921275–, pp. 153-154) **Accessibility of smoke, heat and CO gas to three-element fire sensor.** Tamura, H. (Fire Research Institute, Tokyo (Japan)); Sato, K.; Kozeki, D.; Hosokawa, M.; Kusanagi, S.; Fujioka, T.; Watanabe, Y. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

In order to find effectiveness of composite sensors including a CO sensor, an experiment was carried out on responsiveness of smoke, heat and CO gas sensors. When a cigarette and a cotton sheet were burned, the CO sensor issued an alarm earlier by three to eight minutes on the whole than the smoke sensor, but when an air conditioning on, both sensors took 22 to 23 minutes before issuing alarms. The heat sensor issued no alarm. When a cigarette alone was burned, only the CO sensor issued an alarm in about four minutes when located directly above the smoke source, and in 10 to 12 minutes when located two meters away from the smoke source. When the air conditioning was turned on, no sensors issued an alarm. When n-heptane and toluene were ignited, all the three sensors began responding after approximately the same lapse of time. When a dried Japanese beech lumber was heated, the CO and smoke sensors started responding at approximately the same time, but the heat sensor gave no response. The CO sensor may sometimes detect smoking condition in the early stage of a fire or cigarette smoldering condition, and respond more quickly than the smoke sensor. The CO sensor may be able to serve for guarding a larger area depending on CO diffusibility. 1 ref., 5 figs., 2 tabs.

23803 (CONF-921276–, pp. 231-234) **Application of TIO2 thin film photocatalyst: construction materials with deodorizing function.** Shinozaki, H. (Tokai University, Tokyo (Japan). School of Engineering); Nakamura, K.; Hasegawa, T.; Saito, T.; Ogawa, T.; Hashimoto, K.; Fujishima, A. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

This paper describes an attempt of deodorization with a photocatalyst and its application to construction materials. A thin film coated with TiO2 sol was used as a photocatalyst. A reductive reaction occurs on the side not irradiated with light, and oxidative reaction occurs on the side irradiated with light. With TiO2, the oxidative reaction using holes progresses normally faster than the reductive reaction to oxidize, decompose, and deodorize odorous substances. An experiment was carried out on deodorizing acetoaldehyde using ultraviolet rays as a light source. The oxidative decomposition rate did not depend on concentrations of the substances. The stronger the light intensity, the faster the reaction rate. The reaction is rate-controlled by light energy. The higher the sintering temperature, and the thicker the film thickness, the more the oxidative decomposition. The effective light wave length is in a range from 300 nm to 380 nm, suggesting a possibility of the reaction even with the sunlight. Odorous gases in actual environments, of which concentrations are generally low, would be able to react sufficiently with somewhat weak light and get decomposed. Problems to be solved include improving the thin film strength and adhesion, and reducing the sintering temperature. 4 refs., 6 figs., 1 tab.

23804 (CONF-921276–, pp. 255-258) **Experimental studies on the thermal performance of lawn-soil covered roof. Part 2.: Comparison of results from experiments and simulations.** Ishihara, O. (Kumamoto University, Kumamoto (Japan)); Zhang, Q. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

An environmental mitigation effect was studied by proposing an environmental computation model in case that the roof of building is covered with lawn and soil. Thermal balance was conceived of each of both air layer having leaves and lawn, and ground surface of soil. Thermal conduction was assumed to be one-dimensional in both soil and roof slab. Not influence of sunlight radiation but percolation heat only between the roof-space and outdoors was taken into consideration for the air layer in the roof-space. As a result of actual measurement, the air temperature in the roof-space was lower and fructuantly smaller than the conventional one, which was attributable to the evaporation effect of lawn, and large thermal capacity and low thermal conductivity. Thermal quantity flowing into the room was computed by using the environmental computation model. The thermal quantity flowing through the present lawn-soil (soil produced in Kumamoto) covered roof in summer was reduced to 65% of that through the conventionally insulated slab roof. When the soil was replaced by light weight artificial soil, the former quantity was further reduced to 26% of the latter one. Against the insulated slab roof, the lawn-soil covered roof and lawn-artificial soil covered roof saved air cooling energy by 7% and 15%, respectively on the top floor of building, and are therefore promising in effective mitigation of the environment. 4 refs., 9 figs.

23805 (CONF-921276–, pp. 259-262) **Study on the thermal performance of the passive air circulation house. Part 9: Comparison of the results from simulations and experiments.** Ishihara, O. (KUmamoto University, Kumamoto (Japan)); Tajima, M.; Hayashi, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Passive air circulation (PAC) house was verified in computation program for both fluctuations in room temperature and thermal load. As compared with the estimation through actual measurement, the air circulation in the building and thermal loss from the wall had been underestimated and overestimated, respectively through simulation. Then as a result of transition in condition by weakening the air resistance in the wall space and strengthening the air circulation, the values obtained through simulation could generally approximate those done through actual measurement. Comparative

computation in air heating load was made between the experimental PAC house and the conventional house which is equivalent to it in thermal insulation performance. The above experimental house saved 47.4% and 46.2% of the required energy for the conventional house in case of one-room house without partition and that divided into more or less six-mat rooms with partitions, respectively. The air heating load diminishes with partitioning the house into a certain number of rooms while the energy saving ratio heightens with making the rooms voluminous. Though future investigation will have to be made on the opening area and clearance-equivalent area of building, the present computation program is judged to be on the safety side for the air heating load. 3 refs., 4 figs., 3 tabs.

23806 (CONF-921276–, pp. 263-266) **Study on utilizing natural energy for indoor climate control using roof and attic space. Part 3.: Experimental analysis on the cooling performance by water flowing down on roof.** Ito, N. (Tokyo Metropolitan University, Tokyo (Japan)); Sunaga, N.; Komano, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Air cooling performance by water flowing down on the roof was studied to adjust the indoor hot heat environment of residential and other buildings. The air cooling is made on a heat-insulating surface of colored steel plate-tiled roof while the thermal collection is done by a heat-collecting panel in its attic space. As an air cooling experiment structure in summer, the previously tested prototype structure was modified by adding polystyrene foamed to a thickness of 50mm under the colored steel plate and making the water flow down with forming a wide film on the roof surface. To investigate the air cooling characteristics with exception of those influenced by the meteorological condition, regression was multiply made by using data from 1900 to 0500 hours having no radiation of solar light, and considering the thermal quantity of air cooling as an object function and dry/wet bulb temperature, wind velocity, etc. as explanatory functions. The thermal quantity of air cooling gave a relativity as high as 0.922 in relativity factor to the temperature differential between the water at inlet and wet bulb, which factor can be used for expressing the air cooling characteristics. Relatively to the above temperature differential of 2 centigrade, air cooling energy of about 250Wh was obtained, which reulted in generally doubling the air cooling characteristics given by the previously tested prototype structure. The cooling by rainfall is not negligible but able to be used as a cold heat source. 2 refs., 9 figs., 1 tab.

23807 (CONF-930427–2) **Gas fueled space conditioning heat pump research in the United States.** Myers, G.H. (Gas Research Inst., Chicago, IL (United States)); Freedman, S.I.; French, C.E.; DeVault, R.C. Oak Ridge National Lab., TN (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. International Energy Agency heat pump conference: heat pump for energy efficiency and environmental progress; Maastricht (Netherlands); 26-29 Apr 1993. Order Number DE93011856. Source: OSTI; NTIS; GPO Dep.

Both gas-engine-driven mechanical vapor compression and gas fuel thermally activated sorption space conditioning heat pump technologies are under development in the United States. The residential 3RT gas-engine heat pump has successfully completed a 10 unit field test and is entering a 50 unit field demonstration phase supported by the manufacturers and the gas industry in the endeavor to commercialize this new HVAC technology. Several sorption technologies, including absorption, adsorption, and chemisorption of ammonia vapor are in various stages of development. Prototype ammonia-water absorption GAX systems have been built and tested in the laboratory with expectations of entering a field test in 1993. Solid-vapor, ammonia-carbon, and ammonia-salt systems are in laboratory system development and bench scale component development stages respectively. All face economic trade-off issues regarding cost and performance.

23808 (DOE/CE/15382–T2) **[Waste water heat recovery system]: Final report, September 30, 1992.** Smart Drain, Inc., Farmingdale, NY (United States). 28 Apr 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-89CE15382. Order Number DE93013234. Source: OSTI; NTIS; GPO Dep.

The production capabilities for and field testing of the heat recovery system are described briefly. Drawings are included.

23809 (DOE/CE/15407–T13) **Extended range tankless water heater: Final technical report.** Harris, J.A. Harmony Thermal Co., Inc., Greeley, CO (United States). 18 Apr 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-89CE15407. Order Number DE93013327. Source: OSTI; NTIS; GPO Dep.

In this research program, a laboratory test facility was built for the purpose of testing a gas-fired water heating appliance. This test facility can be used to examine the important performance characteristics of efficiency, dynamic response, and quality of combustion. An innovative design for a tankless water heater was built and then tested to determine its performance characteristics. This unit was tested over a 5:1 range in input (20,000 to 100,000 btuh heat input). The unit was then configured as a circulating hot water boiler, and a specially designed heat exchanger was used with it to generate domestic hot water. This unit was also tested, and was found to offer performance advantages with regard to low flow and temperature stability.

23810 (DOE/CE/23810–7) **Theoretical evaluation of R22 and R502 alternatives: Final report.** Domanski, P.A. (National Inst. of Standards and Technology (NEL), Gaithersburg, MD (United States). Building Environment Div.); Didion, D.A. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); National Inst. of Standards and Technology (NEL), Gaithersburg, MD (United States). Building Environment Div. Jan 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014767. Source: OSTI; NTIS; GPO Dep.

The study was conducted using a semi-theoretical model, CYCLE-11, with a pure cross-flow representation of heat transfer in the evaporator and condenser. The Carnahan-Starling-DeSantis equation of state was used for calculating thermodynamic properties. Transport properties were not involved in the simulations. Simulations were conducted for "drop-in" performance, for performance in a modified system to assess the fluids' potentials, and for performance in a modified system equipped with a liquid-line/suction-line heat exchanger. The results - presented on a relative basis to R22 and R502 performance - include the volumetric capacity, coefficient of performance, pressure increase across the compressor, and compressor discharge pressure and temperature.

23811 (DOE/ER/60547–5) **Measurement and apportionment of radon source terms for modeling indoor environments: Final progress report, March 1990–August 1992.** Harley, N.H. New York Univ. Medical Center, NY (United States). Dept. of Environmental Medicine. 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60547. Order Number DE93013976. Source: OSTI; NTIS; INIS; GPO Dep.

During the present 2 1/2 year contract period, we have made significant Progress in modeling the source apportionment of indoor ^{222}Rn and in ^{222}Rn decay product dosimetry. Two additional areas were worked on which we believe are useful for the DOE Radon research Program. One involved an analysis of the research house data, grouping the hourly house ^{222}Rn measurements into 2 day, 7 day and 90 day intervals to simulate the response of passive monitors. Another area requiring some attention resulted in a publication of 3 years of our indoor/outdoor measurements in a high-rise apartment. Little interest has been evinced in apartment measurements yet 20% of the US population lives in multiple-family dwellings, not in contact with the ground. These data together with a summary of all other published data on apartments showed that apartments have only about 50% greater ^{222}Rn concentration than the measured outdoor ^{222}Rn. Apartment dwellers generally represent a low risk group regarding ^{222}Rn exposure. The following sections describe the main projects in some detail.

23812 (DOE/FTR–93012813) **Participation in conferences concerning the use of computers in the energy/architecture design process: Foreign trip report, August 11–September 3,**

1992. Brown, G.Z. (Oregon Univ., Eugene, OR (United States). Dept. of Architecture). Pacific Northwest Lab., Richland, WA (United States). 24 Sep 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012813. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The trip was in support of the Advanced Energy Design and Operating Technology and Energy Efficient Industrialized Housing research projects. A broad range of comment was obtained on information presented on these projects. The general direction of projects was confirmed by other researchers. Some valuable detailed changes were suggested. Two conferences, two universities, two research institutes and several building sites were visited. Opportunities for collaboration were discovered at three locations. A new waste material foam product was discovered and will be evaluated for testing in our stressed skin panel project. Transparent insulation will be evaluated for use in US industrialized housing, based on the experience of Dutch researchers.

23813 (LBL–33404) **Luminance in computer-aided lighting design.** Ward, G.J.; Rubinstein, F.M.; Grynberg, A. Lawrence Berkeley Lab., CA (United States). Aug 1987. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-890615–4: Building simulation '89, Vancouver (Canada), 23-24 Jun 1989). Order Number DE93010458. Source: OSTI; NTIS; GPO Dep.

Traditionally, the lighting engineering community has emphasized illuminance, the amount of light reaching a surface, as the primary design goal. The Illuminating Engineering Society (IES) provides tables of illuminances for different types of tasks which lighting engineers consult in designing lighting systems. Illuminance has proven to be a popular metric because it corresponds closely to the amount of energy needed to light a building as well as the initial cost of the lighting system. Perhaps more importantly, illuminance is easy to calculate, especially in simple unobstructed spaces with direct lighting. However,illuminance is not well correlated with visual performance, which is the real reason for installing a lighting system in the first place. Visual performance is a psychophysiological quantity that has been tied to physical quantities such as contrast, size and adaptation level by subject experiments. These physical quantities can be approximated from illuminance using a host of assumptions about the environment, or derived directly from the distribution of luminance. Luminance is the quantity of light traveling through a point in a certain direction, and it is this quantity that the eye actually "sees". However, the difficulty of calculating luminance for common tasks has made it an unpopular metric. Despite its importance to lighting design, luminance is rarely used because there is a lack of the necessary computational tools.In this paper, we will demonstrate a computer calculation of luminance that has significant advantages for lighting design. As well as providing an immediate evaluation of visual quality for task performance, less quantifiable factors such as aesthetics can be studied in synthetic images produced by the program.

23814 (NEI-DK–1130) **Low-energy window panes with the heat-reflecting film coating "heat mirror": Demonstration project and production potentials in Denmark.** Boye Olesen, G.; Staal Paulsen, O. Koebenhavns Miljoe- og Energikontor, Copenhagen (Denmark); Four Seasons, Kolding (Denmark). Feb 1993. 17p. (In Danish). Contract ENS-UVE-89.0618. Order Number DE93794678. Source: OSTI; NTIS.

A new type of low-energy double glazed window is now on the Danish market. It consists of two panes with a heat reflecting film between then. A type of film manufactured in California ("Heat Mirror") and another made in Japan (Reftel film) are investigated. These films and their uses are described in detail and relevant data on heat losses, U-values, light transmittance, measurements etc. are given. A report is presented from two demonstration houses with double glazed windows fitted with "Heat Mirror". An inhabitant claims that these windows save as much energy as other double glazed window types. Investment costs vary in relation to types of household heating systems. A individual house owner can pay twice as much as another person living in a housing cooperative connected to the district heating system in Copenhagen. An overview is given of work done until now to promote production of this type of window in Denmark, and necessary actions to take in order to establish this production. (AB).

23815 (NEI-DK–1141) **The way to lower electricity consumption: Saving electricity in the homes of Danish consumers.** Viegand, J. (ed.). ARKE, Aarhus (Denmark); BHHH, Horsens (Denmark); EASV, Skaerbaek (Denmark); HEF, Aalborg (Denmark); KOH, Kolding (Denmark); Danmarks Naturfredningsforening, Copenhagen (Denmark); Danmarks Tekniske Hoejskole, Lyngby (Denmark). Fysisk Lab. 3. Dec 1992. [98p.] (In Danish). Contract ENS-51191-91.0055. Order Number DE93794676. Source: OSTI; NTIS.

The aim was to demonstrate how households can lower their consumption of electricity by changing their habits and substituting their old electrical appliances for new and better ones. A group of 100 families was trained in good habits related to electricity use and another group of 20 families not only received the same training but were also enabled to change out their electric appliances. The annual electricity consumption was measured throughout one year in the case of each family. Results showed that the first group had reduced consumption by 12% and the second by 47%. The second group saved most on refrigerators and deep freezers and on other appliances which needed lights. Here the saving was 59%-66%. In the case of washing and washing up machines the saving was 40% and 37% respectively. Saving on clothes-drying machines amounted to a reduction of 9%, on cookers 18% and on central-heating boilers, circulation pumps and electric water heaters 33%. It was shown that it was possible to grow into the habit of saving energy and also to sustain these habits without lowering the level of comfort, that daily meter reading was promotive to electricity saving habits and that low-energy electric bulbs aided conservation. Electricity-saving habits can be stimulated by measuring temperatures in refrigerators etc. and significant reduction in consumption can be obtained by substituting electrical appliances for more energy-efficient models. (AB).

23816 (ORNL/CON–333) **Research update, existing buildings research, 1989–1991.** MacDonald, J.M. (Oak Ridge National Lab., TN (United States)); Ternes, M.P.; Mixon, W.R.; Sharp, T.R.; Kolb, J.O.; Wilkes, K.E.; Diamond, R.C.; Judkoff, R.; Mazzucchi, R.P. Oak Ridge National Lab., TN (United States). Feb 1993. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012517. Source: OSTI; NTIS; GPO Dep.

This Research Update presents the status of the Existing Buildings Research program of the Office of Building Technologies of the US Department of Energy for the period 1989-199 1. This program covers research on energy efficiency improvements for the residential and commercial buildings in this country. ne Existing Buildings Research program has contributed to significant improvements in energy efficiency of existing buildings by development of improvements to retrofit technologies, by coordinating and conducting research studies on the use of energy efficiency technologies (to reduce barriers and increase use), and by continually evaluating changes in technologies that could improve and maintain buildings energy efficiency. If the energy efficiency of the buildings sector in this country is to be dramatically improved over the next 30 years, we must improve the use of energy efficiency technologies. Improved delivery of measures, improved understanding of how buildings actually perform in the field, and methods for improving operations and maintenance of buildings and energy equipment are all examples of ways to improve the deployment (transfer) of technologies. Much has been learned about technology deployment in buildings in the first five years of the program, and our future plans will be directed at continuing the improvements and making a real contribution to the energy efficiency future of the United States.

23817 (PNL–8616) **User's guide for ENVSTD24 program, Version 2.4.** Hanlon, R.L.; Connell, L.M. Pacific Northwest Lab., Richland, WA (United States). May 1993. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014185. Source: OSTI; NTIS; GPO Dep.

On January 30, 1989, the US Department of Energy (DOE) promulgated an interim rule entitled "Energy Conservation Voluntary Performance Standards for New Commercial and Multi-Family High

Rise Residential Buildings; Mandatory for New Federal Buildings" (10 CFR Part 435, Subpart A). These standards require federal agencies to design all future federal commercial and multifamily high-rise residential buildings in accordance with the standards, or demonstrate that their current requirements already meet or exceed the energy-efficiency requirements of the standards. Although these newly enacted standards do not regulate the design of nonfederal buildings, the DOE recommends that all design professionals use the standards as guidelines for designing energy-conserving buildings. To encourage private sector use, the DOE published the standards in the January 30, 1989, Federal Register in the format typical of commercial standards. The Pacific Northwest Laboratory developed several computer programs for the DOE to make it easier for designers to comply with the standards. One of the programs, ENVSTD24 (Version 2.4), is detailed in this user's guide and is provided on the accompanying diskettes. The program will facilitate the designer's use of the standards dealing specifically with building envelope design. Using this program will greatly simplify the designer's task of performing the calculations needed to determine if a design complies with the standards.

23818 (PNL-SA–22157) **AEDOT technology.** Shankle, D.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012866. Source: OSTI; NTIS; GPO Dep.

Most commercial buildings designed today will use more energy and cost more to operate and maintain than necessary. If energy performance were considered early in building design, 30% to 60% of the energy now used in new commercial buildings could be saved cost-effectively. However, most building design teams do not adequately consider the energy impacts of design decisions to achieve these savings; the tools for doing so simply do not yet exist. Computer technology can help design teams consider energy performance as an integral part of the design process. This technology could enable designers to produce much more energy-efficient buildings without increasing the costs of building design. Recognizing this, the US Department of Energy (DOE) has initiated the Advanced Energy Design and Operation Technologies (AEDOT) project, led by Pacific Northwest Laboratory (PNL). The aim of the project is to develop advanced computer-based technologies that will help designers take advantage of these potentially large energy savings. The success of the AEDOT project depends largely on the ability to develop energy design-support tools that can be integrated into comprehensive building design environments so that all parts of the design process willbe supported. Energy, just one consideration among many in building design, must be considered in a context that includes visual, acoustic, and structural aspects; accessibility; thermal comfort; indoor air quality; cost; and other factors associated with the quality, acceptability, and performance of a building. Advanced computer-aided design support environments will need to integrate tools from many different domains and provide access to the vast amounts of data that designers need to apply these tools and to make informed decisions.

23819 (SAND–92-2270C) **What is IAQ.** Huff, G. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306159–1: 1993 Society of Women Engineers (SWE) conference, Chicago, IL (United States), 21-27 Jun 1993). Order Number DE93012349. Source: OSTI; NTIS; GPO Dep.

Does indoor air quality (IAQ) affect you? The answer is an emphatic YES! Problems affecting indoor air quality can range from a stinky rest room to Sick Building Syndrome. IAQ goes beyond avoiding odors through sufficient ventilation. Many health issues are also involved. IAQ problems are generally complex with no single source causing them. Rather, they result from a combination of several sources that require an organized, but flexible, plan of attack. The purpose of this paper is to define the terms associated with the subject of IAQ, provide some history on the subject, and finally describe my experiences with the continuing process of assessing and remediating problems associated with poor indoor air quality in a new laboratory building.

23820 (TTKK-JULK–87) **Thermal analysis of buildings - verification and further development of the TASE program.** Kalema, T. Tampere Univ. of Technology (Finland); National Board of Waters and the Environment, Helsinki (Finland). Environmental Data Centre. 1992. 185p. Order Number DE93794776. Source: OSTI; NTIS.

The TASE program, which is a transient multiroom model for the thermal analysis of buildings, is verified using both laboratory measurement data and the internationally well-known DOE, ESP and SERIRES programs. In the former of these the average room air temperatures, surface temperatures and values of wall heat flux for a step change in radiator power, and in the latter the peak heating and cooling loads and annual energies, employing Denver as well as Memphis (USA) weather data, are compared. The accuracy of the thermal analysis is improved by taking into account variations in interior convective and radiative heat transfer coefficients and the transient multidimensional heat transfer for a ground slab. Energy savings using transparent insulation on exterior walls in Finnish climate conditions are studied using a model in which the transparent insulation is treated as an effective absorption coefficient for which an equation is derived.

23821 (TTKK/LT–68) **Absorption heat pumps in heating and cooling systems.** Aittomaeki, A.; Vaelimaeki, A.; Koepsi, M. Tampere Univ. of Technology (Finland). Thermal Engineering. 1989. 70p. (In Finnish). Order Number DE93794784. Source: OSTI; NTIS.

LVIS 2000 Research Programme.

The application of an absorption heat pumps as the heating and cooling system of an office building has been studied by means of a simulation model, designed for this application purpose. The effects of an absorption heat pump on emissions that are harmful to the environment depend on the fuel used. If the fuel is lightweight oil or gas, the sulphur and particle emissions diminish, but NO_x and hydrocarbon emissions may increase as the combustion units become smaller. The use of an absorption heat pump reduces CFC emissions because other refrigerants are used in an absorption heat pump.

23822 (NAL-TM–647) **Investigation on the effectiveness of the piping interference removal system for STOL aricraft wind tunnel tests.** Takahashi, H. (National Aerospace Laboratory, Tokyo (Japan)); Nakaya, T.; Noguchi, M.; Nonaka, O.; Hoshino, H.; Inoue, T. National Aerospace Lab., Chofu, Tokyo (Japan). Apr 1992. 25p. (In Japanese). Order Number DE93793614. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

A wind tunnel test on a powered model using high-pressure air generates interference force from pressure piping, acting on a balance. A device was developed to reduce this interference force using the principle of an air bearing. This device utilizes an air joint inserted with triple cylinders with rotation centers eccentric with each other. Upon having verified that the device reduces the interference force with good reproducibility, wind tunnel experiments were carried out that included such test items as α, β continuous sweep reproducibility, supply air variation reproducibility, equivalent pattern reproducibility, and comparison with the conventional rubber hose system. From the test result, such advantages were discovered that the device has little piping interference force, eliminates a need of piping interference correction, can repeat the α, β sweep continually, and improves symmetry during a β-sweep. Disadvantages include necessity of a skill foroperation, susceptibility to environmental conditions, and high supply air pressure, but all of them would be possible to be solved. 9 refs., 28 figs., 2 tabs.

23823 (NAL-TR–1145) **Estimation of the attitude motion of the small satellite "ORIZURU".** Nakajima, A. (National Aerospace Laboratory, Tokyo (Japan)); Terui, F.; Ishii, K.; Habe, H. National Aerospace Lab., Chofu, Tokyo (Japan). Apr 1992. 28p. (In Japanese). Order Number DE93793616. Source: OSTI; NTIS; Available

from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

An estimation was made on the in-orbit attitude motion of the small engineering experimental satellite 'ORIZURU'. Attitude data are provided only from the satellite's sun sensors. To estimate the attitude motion, the flight data were compared with numerical simulation results, and parameters with coinciding patterns were sought. The attitude motion is estimated as follows: The spin cycle grew longer at a certain rate as the time elapses (decrease in spin angular speed), the time of 41.5 seconds at the beginning varies at a rate of 0.89 sec/d. Major cause for this phenomenon should be the influence from eddy current. Lateral moment at separation from the rocket generates nutation whose angle is 52.1 degrees. The sun angle varies largely in the simulation. This should be because of actions of disturbance torques such as eddy current torques. The spin cycle change was extrapolated, where the spin cycle immediately after separation from the rocket was estimated 39.7 seconds. From this value, the external force imposed from the spring at the separation was calculated 0.66 Nms for axis circumference and 0.84 Nms for perpendicular axis circumference. 4 refs., 12 figs., 3 tabs.

23824 (NAL-TR–1165) **In-orbit performance tests and telecommand systems of the umbrella test satellite (DEBUT).** Kumagai, T. (National Aerospace Laboratory, Tokyo (Japan)); Nakajima, A.; Sakurai, Y. National Aerospace Lab., Chofu, Tokyo (Japan). Jun 1992. 25p. (In Japanese). Order Number DE93793624. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

This paper reports on the command control system, the telemetry analytic system and the space experiment operation in DEBUT (Deployable Boom and Umbrella Test Satellite). The experimental devices are divided largely into a command control device to operate the mission system of the satellite, and a telemetry analytic device to analyze data for a bus condition or a mission condition. The former device consists of a computer and a command generator. Programs for the latter device has enough room for real-time data processing and display. These devices had relatively simple construction, but the reliability was so high that none of them has developed a malfunction. Because the space experiments were completed earlier than the schedule, some more experiment modes were added. No problems were experienced in interface of the ground station facilities with the command control and telemetry analysis systems. An erroneous interpretation has occurred on the satellite in a command signal because of a cyclic fading in an orbit with a low satellite elevation angle, but the malfunction determining program performed a retransmission by which a correct command was executed. 4 refs., 15 figs., 14 tabs.

23825 (NEI-DK–1151) **Energy consumption by the private and commercial vehicles, and by public transport facilities, which comprise urban street traffic.** Cowiconsult Raadgivende Ingenioerer A/S, Lyngby (Denmark). Mar 1993. 77p. (In Danish). Contract ENS-1243/91-0003. Order Number DE93794691. Source: OSTI; NTIS.

EFP-91.

The aim was to compare the energy consumption by private and commercial vehicles with that of public transport facilities constituting urban street traffic, and to evaluate the influence of various traffic related plans such as green waves (where cars are able to drive through the town with relatively few accelerations and braking) streets with lower speed limits and special lanes and priorities for buses. The traffic pattern in four Copenhagen streets (Jagtvej, Soelvgade, Bredgade and Strandvejen) were measured and analyzed both in, and not in, the rush hour, and a special model was used to calculate the energy consumption. The model defines degree of acceleration and slow-down and speed when calculating energy consumption with regard to various driving patterns. It also calculates carbon dioxide emission. It was found that energy consumption decreased with increasing driving speed at 10-60 km/h for all vehicles. The case of buses is a little different because of having to stop so frequently. Bus lanes decrease the number of stops because of traffic situations, but do not seem to result in energy savings. These lanes decrease space for other vehicles which can result in more pollutive emission. When buses are not required to stop at traffic lights (because of bus lane innovation), energy is saved to the amount of 5-10%. An evenness of traffic flow can reduce energy consumption by 10% (Soelvgade), 20% (Bredgade) and 35-40% (Soelvgade and Jagtvej). It is concluded that the use of bus lanes and bus priorities results in greater energy saving in the case of private cars because of the irregularity of bus driving patterns. (AB).

23826 (NEI-DK–1169) **Freight transport in towns: Main report.** Cowiconsult Raadgivende Ingenioerer A/S, Lyngby (Denmark). Oct 1992. 122p. (In Danish). Contract ENS-1243/91-0001. Order Number DE93794745. Source: OSTI; NTIS.

EFP-91.

The aim was to evaluate a number of possibilities for reducing energy consumption and thus air pollution caused by freight transport in urban areas. The Danish towns of Vejle and Roskilde were taken as examples and the two towns were compared with regard to the town plan, use of land area, the road network, amount of traffic and commercial structure. Economical aspects and the most important initiatives for improvements, including a decrease in traffic accidents, are discussed. These initiatives are coordination of transportation by firms, more drivers using the same vehicles, less frequent deliveries, optimazation of route planning, car sharing, special routes for lorries, traffic and speed control, better siting of new transport functions, re-siting of firms dependent on freight transport, the use of smaller vehicles where possible, no transport of people in trucks or vans, less use of bicycles for transporting messages, more use of underground pipes for transport of materials, lifting equipment for smaller vans and trucks, lifting equipment that is more flexible, motors turned off when loading and loading, reduction of emballage volume, and a more careful way of driving which can help to reduce energy consumption. A computer programme was constructed in order to calculate energy consumption in these relations, emission of hydrocarbons, carbon monoxide, nitrogen oxides and particles, transportation costs and number of traffic accidents. Results are presented in detail and discussed. (AB) (78 refs.).

23827 (NEI-DK–1170) **Freight transport in towns: Summary report.** Cowiconsult Raadgivende Ingenioerer A/S, Lyngby (Denmark). Apr 1993. 33p. (In Danish). Contract ENS-1243/91-0001. Order Number DE93794758. Source: OSTI; NTIS.

EFP-91.

The aim of the project was to determine possibilities for making freight transport in towns efficient and to reduce the negative effects on the urban environment of this type of road transport. The Danish towns of Vejle and Roskilde were chosen for investigation and comparison. This publication summarizes results reached in the main report of the same title. After a short general summary of the project methods the resulting recommendations are presented in detail in the form of schemes, each presenting a more detailed description of the recommendation, ideas for a possible spreading of the initiative to cover a larger area of freight transport, and some notes on implementation. The effect in each case is illustrated in the form of a graph showing amount of energy saving, reduction in hydrocarbon, nitrogen oxides, carbon monoxide and particle emission, and reduction in transport economy and traffic accidents. (AB).

23828 (NREL/TP–432-4882) **Non-CFC air conditioning for transit buses.** Pesaran, A.A.; Parent, Y.O.; Bharathan, D. National Renewable Energy Lab., Golden, CO (United States). Nov 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000033. Source: OSTI; NTIS; GPO Dep.

In the United Sates, more than 80% of transit city buses are air conditioned. Vapor compression refrigeration systems are standard for air conditioning buses and account for up to 25% of fuel consumption in the cooling season. Vapor compression devices use chlorofluorocarbons (CFCs), chemicals that contributes to Earths's ozone depletion and to global warming. Currently, evaporative cooling is an economical alternative to CFC vapor compression refrigeration for air conditioning buses. It does not use CFCs but is restricted in use to arid climates. This limitation can be eliminated

by dehumidifying the supply air using desiccants. We studied desiccant systems for cooling transit buses and found that the use of a desiccant-assisted evaporative cooling system is feasible and can deliver the required cooling. The weight and the size of the desiccant system though larger than vapor compression systems, can be easily accommodated within a bus. Fuel consumption for naming desiccant systems was about 70% less than CFC refrigeration system, resulting in payback periods of less than 2.5 years under most circumstances. This preliminary study indicated that desiccant systems combined with evaporative cooling is a CFC-free option to vapor compression refrigeration for air conditioning of transit buses. The concept is ready to be tested in a fun prototype scale in a commercial bus.

23829 (ORNL–6743) **Transportation energy data book: Edition 13.** Davis, S.C.; Strang, S.G. Oak Ridge National Lab., TN (United States). Mar 1993. 335p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013846. Source: OSTI; NTIS; GPO Dep.

The Transportation Energy Data Book: Edition 13 is a statistical compendium prepared and published by Oak Ridge National Laboratory (ORNL) under contract with the Office of Transportation Technologies in the Department of Energy (DOE). Designed for use as a desk-top reference, the data book represents an assembly and display of statistics and information that characterize transportation activity, and presents data on other factors that influence transportation energy use. The purpose of this document is to present relevant statistical data in the form of tables and graphs. Each of the major transportation modes – highway, air, water, rail, pipeline – is treated in separate chapters or sections. Chapter 1 compares US transportation data with data from seven other countries. Aggregate energy use and energy supply data for all modes are presented in Chapter 2. The highway mode, which accounts for over three-fourths of total transportation energy consumption, is dealt with in Chapter 3. Topics in this chapter include automobiles, trucks, buses, fleet automobiles, federal standards, fuel economies, and vehicle emission data. Household travel behavior characteristics are displayed in Chapter 4. Chapter 5 contains information on alternative fuels and alternatively-fueled vehicles. The last chapter, Chapter 6, covers each of the nonhighway modes: air, water, pipeline, and rail, respectively.

23830 (UCRL-JC–109420) **Compatibility specifications for AVI equipment in California.** Davis, D. (Lawrence Livermore National Lab., CA (United States)); Dunn, D.; Jelsma, L.; Blum, A.; Kubel, L.; Winter, W.; Pinkerman, K.; Rounds, R. Lawrence Livermore National Lab., CA (United States); California State Dept. of Transportation, Sacramento, CA (United States). Div. of New Technology, Transporation Materials and Research. Jan 1992. 8p. Sponsored by California State Government, Sacramento, CA (United States). DOE Contract W-7405-ENG-48. (CONF-9206335–3: International symposium on automotive technology and automation, Florence (Italy), 1-5 Jun 1992). Order Number DE93012486. Source: OSTI; NTIS; GPO Dep.

This paper presents an overview of the functional and technical specifications recently developed in California for automatic vehicle identification (AVI) systems. The goal is to ensure compatibility between systems implemented throughout California by various toll authorities for electronic toll collection. A secondary goal is to structure the specifications to enable upward compatibility of these systems for applications beyond toll collection such as IVHS while minimizing costs by encouraging vendor competition. Both of these objectives were achieved. The AVI compatibility specifications were developed around the two principal system elements; the toll agency reader and the on-vehicle transponder. The specifications call for two-way communications between these elements with user defined message formats. This permits a number of important options including non-interference with other systems, data encryption for account security, transaction verification, and write to transponder options such as toll road intransit data and account balance updating. The role of the reader is (1) to wake up or fully activate a vehicle transponder within its domain of influence, (2) to pole the transponder requesting specific information, and (3)to provide an acknowledge message after receiving a valid transponder response. The transponder's role is to interpret the polling message from the reader and respond as appropriate. The intent of our effortswas not to specify an AVI system design but rather to establish over-the-air communication protocols. However, some hardware related decisions had to be made. One such choice was the selection of modulation backscatter for transponder signaling rather than using an active RF source. This places frequency control and precision in the hands of the reader where we felt it should be.

23831 (CONF-921275–, pp. 123-126) **Decomposition treatment of organic chlorine compounds by means of high-temperature melts utilizing nucleophilic desplacment reaction.** Sakai, Y. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Yazawa, T.; Asakura, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

While disposition of organic chlorine compounds that present environmental destruction problems uses incineration, this paper pursues a possibility of high-rate decomposition at lower temperature than in an incineration process, by means of high-temperature melts. Dichloromethane, choloroform, and carbon tetrachloride (hereinafter referred to as A, B, and C, respectively) were used as test samples, which were introduced into a reaction container as a nitrogen gas mixture with concentrations from 15% to 20%. The reaction container charged with 20 g of NaOH and set to a temperature of 200°C had the gas pass through at a flow rate of 20 ml/min for two hours. Based on the measurement of the gas concentrations before and after the reaction, the ratio of difference in the concentrations at an inlet and an outlet was used as the decomposition factor (%). To achieve a decomposition factor of 90% without presence of a melt, all of the test samples required a temperature of 550°C or higher, while with presence of molten NaOH, the factor reached nearly 100% at 400°C in the samples A and B. The sample C showed somewhat inferior result. These relationships can be explained with three-dimensional disturbances in the nucleophilic reaction. 4 refs., 3 figs.

23832 (CONF-921275–, pp. 127-128) **Evaluation on combustibility of halogenized hydrocarbons using diffusion combustion process.** Matsui, H. (Research Institute of Industrial Safety, Tokyo (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Because disposition of halogenized hydrocarbons presents problems from environmental issues and toxicity, their disposition using incineration requires full quantitative evaluation on their combustibility. This paper describes an attempt of applying as an index for the combustibility of halogenized hydrocarbons an oxygen index (OI = 100)×O2/(O2 + N2). Experiments were carried out on 24 kinds of halogenized hydrocarbons to obtain limiting oxygen concentrations in diffusion combustion (OI values), using a diffusion combustion testing device (according to the Ministry of Transport standard). A wick method was used when the samples are gaseous, and a cotton method when liquid, both methods provided reasonable results. Based on the resultant OI values, the combustibility was classified into three ranks, combustible (OI $\leq$ 30), fire-retardant (30$\leq$OI$\leq$60), and noncombustible (OI$\geq$60). Fire-retardant compound, for example, includes such a compound as CH3Br, and means those with no free diffusion combustion possible in air, but have an explosion limit in a gas mixed with air. 2 refs., 1 fig., 1 tab.

23833 (CONF-921276–, pp. 139-142) **Study on solar chemical heat pump system.: Experiment on dehydrogenation of 2-propanol and distillation of products.** Aoki, H. (Tokyo University of Agriculture and Technology, Tokyo (Japan)); Horigome, T.;

Doi, T.; Tanaka, T.; Takashima, T.; Fujii, T.; Kamoshida, J. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Chemical heat pump being taken notice of for the effective utilization of low temperature heat obtained from the solar energy, experiment was made on the decomposing reaction of 2-propanol and distillation/separation of its products by using a reaction plant having a distillation tower. The plant is composed of reaction vessel, distillation tower, agitator, reflux distibutor, condenser, etc. Treatment having been made through reduction by hydrogen before the reaction, fine metallic particles of nickel prepared through a gasborne evaporation method were used as a catalyst of endothermic reaction. Influence of fluctuation in heating quantity was small under the condition of 1/10 in reflux ratio, 100 centigrade in oil-heating vessel temperature and 540l/h in condenser-cooling water flow rate. The molar separation ratio of acetone of the distilled liquid at the top of tower could be changed by changing the reflux ratio under the condition of 110 centigrade in oil-heating vessel temperature and 530l/h in condenser-cooling water flow rate. Influence of reflux rate was not observed on the temperature in the lower portion of distillation tower and endothermic reaction. 3 refs., 5 figs.

23834 (DOE/BP–2017) **Cogeneration: A regulatory guide to leasing, permitting, and licensing in Idaho, Montana, Oregon, and Washington.** Deshaye, J. (Washington State Energy Office, Olympia, WA (United States)); Bloomquist, R.G. USDOE Bonneville Power Administration, Portland, OR (United States); Washington State Energy Office, Olympia, WA (United States); Oregon State Dept. of Energy, Salem, OR (United States). Dec 1992. 239p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-91BP16067. Order Number DE93012370. Source: OSTI; NTIS; GPO Dep.

This guidebook focuses on cogeneration development. It is one of a series of four guidebooks recently prepared to introduce the energy developer to the federal, state and local agencies that regulate energy facilities in Idaho, Montana, Oregon, and Washington (the Bonneville Power Administration Service Territory). It was prepared specifically to help cogeneration developers obtain the permits, licenses and approvals necessary to construct and operate a cogeneration facility. The regulations, agencies and policies described herein are subject to change. Changes are likely to occur whenever energy or a project becomes a political issue, a state legislature meets, a preexisting popular or valuable land use is thought threatened, elected and appointed officials change, and new directions are imposed on states and local governments by the federal government. Accordingly, cogeneration developers should verify and continuously monitor the status of laws and rules that might affect their plans. Developers are cautioned that the regulations described herein may only be a starting point on the road to obtaining all the necessary permits.

23835 (DOE/MC/11076–3338) **Evaluation of products recovered from scrap tires for use as asphalt modifiers.** McKay, J. Western Research Inst., Laramie, WY (United States). May 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-86MC11076. Order Number DE93000275. Source: OSTI; NTIS; GPO Dep.

Western Research Institute performed rheological tests and water sensitivity tests on asphalt cements that had been modified with carbonous residues obtained from the pyrolysis of scrap tires and waste motor oil. These tests are part of an ongoing program at the University of Wyoming Chemical Engineering Department to evaluate, as asphalt additives, solid carbonous products recovered from the scrap tire and waste motor oil pyrolysis experiments conducted at the University. The tests showed that carbonous residues increased the viscosity and decreased the elasticity of AC-10 and AC-20 asphalts. The tests also indicatedthat asphalt cements modified with carbonous residues were less sensitive to water damage and age embrittlement than unmodified asphalt cements.

23836 (KCP–613-5193) **Establishing a comprehensive recycling process at KCD.** Beauchamp, B. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Apr 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-930483–6: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993). Order Number DE93012885. Source: OSTI; NTIS; GPO Dep.

An effort is being undertaken at the Kansas City Division to enhance its over-all recycling program by establishing a comprehensive recycling process. The objective of this recycling process is to optimize the use of our resources of people, equipment, time, and money as we search for ways to minimize the amount of waste generated and disposed of at our facility. The comprehensive recycling process which is being developed consists of a checklist which will help the user identify all the steps needed to take a recycling opportunity from initial concept to completed program in a manner which is effective and efficient. The purpose of this presentation is to address the efforts which have been, and are now being, made to achieve this objective.

23837 (NEI-DK–1150) **Analysis and optimization.** Energiministeriets Forskningsprogram. Erhvervslivets processer pg produkter. Christensen, S. (NU Energy A/S (Denmark)); Rovs Hansen, S.; Widell, K.E.; Broens Christensen, O.; Krogh Jensen, J. N og R Consult A/S, Alleroed (Denmark); NU Energy, Aalborg (Denmark). Dec 1992. [57p.] (In Danish). Contract ENs-1223/91-0007. Order Number DE93794692. Source: OSTI; NTIS.

EFP-91.

Danish industrial processes are responsible for 20% of the country's total energy consumption. It is claimed that systematic analysis and optimization of energy-consuming processes could substantially reduce this figure. It is possible to establish cogeneration plants for individual electric power and heat supply, this solution is also economically attractive. The overall aim was to initiate easy-to use computer simulations of industrial energy systems that can be utilized by consultants for analysis and optimization of individual industrial energy systems. This project describes the improvement of the simulation tool, the setting up of a module for the calculation of the economical consequences of the suggestions for a more efficient use of energy and a module for calculating the influence of sulfur oxides, nitrogen oxides, carbon dioxides and particles reduction on energy consumption. The final testing of the software is also described. (AB).

23838 (NEI-DK–1155) **Frigodan, Svendborg: Report on energy survey.** Jensen, N.E. Carl Bro Gruppen, Glostrup (Denmark). Mar 1993. 125p. (In Danish). Contract ENS-51191-92.0043. Order Number DE93794748. Source: OSTI; NTIS.

During the period July 1992 - February 1993 an energy survey was carried out at the Danish firm FRIGODAN in Svendborg. The firm produces frozen foods based on peas, carrots, leaks, rice and pasta. The energy-using equipment and the use of energy were examined on the basis of a registration of the former, of consumption measurements already made, a description of the pattern of operation given by an employee engineer and measurement of electric power consumption in relation to the cooling compressors already carried out by a local electric company. Energy consumption and production were analysed and a number of recommendations to improve energy efficiency by means of energy savings and improvements in the system involving economical aspects were given. Many possibilities for energy conservation were found, but not all were economically feasible. Total energy saving where the payback period could be under four years could be 1,606 MWh/yr. The cooling system could with advantage be rebuilt, but the repay period would be very long. (AB).

23839 (PNL–8600) **Workshop on coatings needs in the auto industry.** Courtright, E.L. Pacific Northwest Lab., Richland, WA (United States). May 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9210343–Exc.Summ.: Workshop on coatings needs in the auto industry, Detroit, MI (United States), 27-28 Oct 1992). Order Number DE93013109. Source: OSTI; NTIS; GPO Dep.

New lightweight materials continue to be of great interest to the automotive industry. Compared to 20 years ago, the average vehicle weight has been reduced by almost a fourth, and fuel economy has nearly doubled. While continued improvements are both desirable and possible, materials choices are narrowing and the

manufacturing methods needed to produce advanced materials systems are much more costly. The incentives remain high, however; particularly in view of large payoffs associated with minimizing structural weight in electric and hybrid-type vehicles. One generic solution is to develop coatings that will enable the use of lower cost materials. A workshop on coatings needs in the auto industry was held in Detroit, Michigan on October 27 and 28, 1992 with the objective of identifying research needs where coatings could enhance the use of energy efficient lightweight materials for automotive applications. Four generic areas had previously been identified auto manufacturers and industry suppliers. These were: Wear Coatings, Hard Protective Coatings for Plastics, Solar Control Coatings, and Process Manufacturing Issues. The development of coatings and coating technologies for lightweight metals and metal matrix composites emerged as the number one research needs. This need underscores the interest in making better use of existing lightweight metals, e.g. magnesium, aluminum, and their alloys. Coatings to protect plastics and reinforced plastic composites were also identified as a major area of importance. Protection from automotive liquids and gases. Coatings that will improve mar resistance, resist UV degradation, or eliminate degradation due to moisture absorption are also needed. Accordingly, manufacturability issues associated with coating light metals, e.g. aluminum, magnesium, and metal matrix composites with wear and corrosion resistant materials, were identified as a high priority research need.

23840 (SAND–93-0347) **Sensor Based Process Control (SBPC) Laboratories Directed Research and Development (LDRD): Final report.** Wronosky, J.B. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013955. Source: OSTI; NTIS; GPO Dep.

This report describes the activities and results of an LDRD entitled Sensor Based Process Control. This research examined the needs of the plating industry for monitor and control capabilities with particular emphasis on water effluent from rinse baths. A personal computer-based monitor and control development system was used as a test bed.

23841 (SAND–93-0886) **Manufacturing technology: A Sandia technology bulletin.** Leonard, J.A.; Floyd, H.L.; Goetsch, B.; Doran, L. (eds.). Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013495. Source: OSTI; NTIS; GPO Dep.

This bulletin describes innovative manufacturing technologies being developed at Sandia National Laboratories. Topics in this issue include: new techniques to overcome barriers to large scale fabrication of vertical cavity surface-emitting lasers (VCSELs), variability reduction in plasma etching of microcircuits, using neural networks to evaluate effectiveness of flux-cleaning methods and alternative fluxes for printed circuit boards, ion implantation to increase the strength and wear resistance of aluminium, and a collaborative project to improve processing of thin-section welded assemblies. (GH)

23842 (UCRL-JC–110431) **Electroplating waste minimization at Lawrence Livermore National Laboratory.** Dini, J.W.; Steffani, C.P. Lawrence Livermore National Lab., CA (United States). Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920851–93: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93012584. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes efforts on waste minimization in the electroplating facility at Lawrence Livermore National Laboratory (LLNL). Issues that are covered include: elimination of cadmium plating, copper cyanide plating, hexavalent chromium plating and vapor degreasing, segregation of cyanide solutions, changing rinsing practices, recycling of rinse water, changing cleaning of aluminum parts and rejuvenation of gold plating solutions. Discussion is also presented on other issues currently being worked and these include: combining electroplating and physical vapor deposition, elimination of all cyanide plating processes, and recycling of electroless nickel and spent acid solutions.

23843 (CONF-930523–3) **Waste-to-energy: Decision making and the decisions made.** Schexnayder, S.M. (Tennessee Univ., Knoxville, TN (United States)); Wolfe, A.K. Oak Ridge National Lab., TN (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 18. National Association of Environmental Professionals (NAEP) annual conference on current and future priorities for environmental management; Raleigh, NC (United States); 24-26 May 1993. Order Number DE93011862. Source: OSTI; NTIS; GPO Dep.

During the early 1980s, it was projected that waste-to-energy (WTE) facilities would manage as much as half of all municipal solid waste by the turn of the century. However, during the latter part of the 1980s, the cancellation rate for WTE facilities grew to the point that the portion of the waste stream WTE will handle in the long-term future is less certain. This study, conducted as part of a larger study, identifies factors that influence municipalities, decisions regarding WTE. This study takes a broad perspective about decision-making within communities, emphasizing the context within which decisions were made and the decision-making process. It does not seek to judge the correctness of the decisions.

23844 (DOE/CE/26602–1) **A novel concept for heat transfer fluids used in district cooling systems: Progress report, September 25, 1990–December 31, 1990.** Cho, Y.I.; Choi, E.; Lorsch, H.G. Drexel Univ., Philadelphia, PA (United States). Dept. of Mechanical Engineering and Mechanics. 4 Jan 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90CE26602. Order Number DE93013298. Source: OSTI; NTIS; GPO Dep.

Low-temperature phase-change materials (PCMS) were mixed with water to enhance the performance of heat transfer fluid. Several PCMs were tested in a laboratory-scale test loop to check their suitability to district cooling applications. The phase-change temperatures and latent heats of fusion of tetradecane, pentadecane, and hexadecane paraffin waxes were measured using a differential scanning calorimeter. The heat of fusion of these materials is approximately 60% of that of ice. They exhibit no supercooling and are stable under repeated thermal cycling. For 10% and 25% PCM-water slurries, the heat transfer enhancement was found to be approximately 18 and 30 percent over the value of water, respectively. It was also found that, in the turbulent region, there is only a minor pumping penalty from the addition of up to 25% PCM to the water. It was demonstrated that pentadecane does not clog in a glass-tube chiller, and continuous pumping below its freezing, point (9.9°C):was successfully carried out in a bench-scale flow loop. Adding PCM to water increases the thermal capacity of the heat transfer fluid and therefore decreases the volume that needs to be pumped in a district cooling system. It also increases the heat transfer rate, resulting in smaller heat exchangers. Research is continuing on these fluids in order to determine their behavior in large-size loops and to arrive at optimum formulations.

23845 (DOE/CE/26602–2) **Thermal analysis of n-alkane phase change material mixtures: Progress report, January 1, 1991–March 31, 1991.** Chio, Y.I.; Choi, E.; Lorsch, H.G. Drexel Univ., Philadelphia, PA (United States). Dept. of Mechanical Engineering and Mechanics. 31 Mar 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90CE26602. Order Number DE93013299. Source: OSTI; NTIS; GPO Dep.

Tests were performed to characterize the thermal behavior of it number of n-alkanes to be used as phase change materials (PCMs) in district cooling applications. Hexadecane and tetradecane were mixed in different fractions, and their thermal behavior was experimentally evaluated. Test results for melting temperature and fusion energy for laboratory grade hexadecane and tetradecane showed good agreement with datain the literature. However, values for commercial grade hexadecane were found to be considerably lower. In the range of temperatures of interest for district

cooling, mixtures of tetradecane and hexadecane can be treated as homogeneous substances. However, their heats of fusion are slightly lower than those of the pure substances. Their melting temperatures are also lower by an amount that can be predicted.

23846 (DOE/CE/26602–3) **Effects of emulsifier on particle size of a phase change material in a mixture with water: Progress report, March 31, 1991–June 30, 1991.** Choi, E.; Cho, Y.I.; Lorsch, H.G. Drexel Univ., Philadelphia, PA (United States). Dept. of Mechanical Engineering and Mechanics. 30 Jun 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90CE26602. Order Number DE93013300. Source: OSTI; NTIS; GPO Dep.

The use of a phase-change material (PCM) in a district cooling system was studied in order to increase the heat transfer performance of the system. One of the major technical obstacles to its use is the clogging of the piping system. The present study attempts to minimize the clogging problem by using an emulsifier. Effects of the emulsifier on the mixture of water and hexadecane (a PCM) were studied. A small amount (60 to 2775 ppm) of emulsifier caused remarkable effects resulting in the production of fine PCM particles. As the amount of the emulsifier was increased in the 25% hexadecane mixture with water, the size of the solid particles of hexadecane became smaller. When the size of the hexadecane particles was small enough, they did not stick together or stick to the surface of the cold wall of a heat exchanger.

23847 (DOE/CE/26602–4) **Development of advanced low-temperature heat transfer fluids for district heating and cooling: Final report, September 25, 1990–September 24, 1991.** Drexel Univ., Philadelphia, PA (United States). 30 Sep 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90CE26602. Order Number DE93013301. Source: OSTI; NTIS; GPO Dep.

The feasibility of adding phase change materials (PCMs) and surfactants to the heat transfer fluids in district cooling systems was investigated. It increases the thermal capacity of the heat transfer fluid and therefore decreases the volume that needs to be pumped. It also increases the heat transfer rate, resulting in smaller heat exchangers. The thermal behavior of two potential PCMs, hexadecane and tetradecane paraffin wax, was experimentally evaluated. The heat of fusion of these materials is approximately 60% of that of ice. They exhibit no supercooling and are stable under repeated thermal cycling. While test results for laboratory grade materials showed good agreement with data in the literature, both melting point and heat of fusion for commercial grade hexadecane were found to be considerably lower than literaturevalues. PCM/water mixtures were tested in a laboratory-scale test loop to determine heat transfer and flow resistance properties. When using PCMs in district cooling systems, clogging of frozen PCM particles isone of the major problems to be overcome. In the present project it is proposed to minimize or prevent clogging by the addition of an emulsifier. Effects of the emulsifier on the mixture of water and hexadecane(a PCM) were studied. As the amount of the emulsifier was increased, the size of the solid PCM particles became smaller. When the size of the particles was small enough, they did not stick together or stick to the cold surface of a heat exchanger. The amount of emulsifier to produce this condition was determined.

23848 (EGG-EP–10715) **Air classification theory and design for municipal solid waste processing: Final report.** US-DOE Idaho Field Office, Idaho Falls, ID (United States); Duke Univ., Durham, NC (United States). Dept. of Civil and Environmental Engineering. Apr 1993. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93011851. Source: OSTI; NTIS; GPO Dep.

Research conducted at Duke University over the past 12 years has led to the development of a promising alternative method for processing municipal solid waste prior to energy production or resource recovery. Pulsed flow air classification is a laboratory-tested method which successfully separates the combustible from the noncombustible components of MSW. IN 1986, Duke subcontracted to EG&G Idaho to perform research in this area for the US Department of Energy. This document represent the final report of that effect, and places this research in the context of all air classification research conducted at Duke University. The goal of this final report is to document the history of pulsed flow air classifier theory and design, while emphasizing test results which confirm success with MSW processing. The three objectives are: Summarize the pulsed-flow air classification theory developed at Duke University; Document the equipment, procedures, test protocols, and results from research constructed at Duke University, with a focus on the combinations and classifier heights and feed rates which produce the best achievable separations, as well as a focus on the estimated cost of a complete classification system; Draw conclusions on the relative merits of selected air classifiers. The development of the theory and design of pulsed flow air classification is initially presented and experimental results are summarized. Pulsing and non-pulsing classifiers are discussed, and a complete system is designed and costed.

23849 (NEI-DK–1156) **Oxygen occurrence in total district-heating systems with a large number of plastic district heating pipes.** Energiministeriets Energiforskningsprogram. Fjernvarme og produktion af el og varme. Oestergaard, L. (Dansk Energi Management A/S, Viby J (Denmark)); Larsen, J.; Amby, L. Dansk Energi Management A/S, Viby (Denmark); Loegstoer Roer A/S (Denmark); Dansk Teknologisk Inst., Taastrup (Denmark). Mar 1993. 63p. (In Danish). Contract ENS-1323/91-0019. Order Number DE93794746. Source: OSTI; NTIS.

EFP-91.

The purpose was to measure the oxygen content of water in a district heating system including both plastic (64% of total grid, not including service pipes) and steel pipes taking seasonal and daily variations in temperature into account. The chemical water treatment was stopped before the measurements took place. The oxygen concentration did not exceed 10-20 μ g/l. Measurements were taken at the outflow from the power station, where the main pipe feeds the plastic pipes, at the consumer position furthest from the power station and where the main pipe feeds into steel pipes and returns to the power station. Whilst measurements of oxygen content during the winter period were stable, the results of measurements taken in July showed considerable variations in oxygen levels, from <10 μg/l to >100 μ g/l, as the steam cushion over the accumulating tank which prevents oxygen reaching the district heating water in the tank was not stable. Measurements were taken in the autumn on diameter 50 mm PEX pipes, steel pipes, plate radiators, unit and steel fittings. The oxygen level is a sign of balance in the system. The balance of oxygen is only an indirect sign of corrosion-related conditions, measurements showed that corrosion is also dependent on the flow of water and the temperature. It was shown that the oxygen content in the system resulting from plastic pipes is low. The level was about 0.25 μg/l, approximately one third of the lowest measured value. It is concluded that there should be no problems with oxygen diffusion through a PEX plastic pipe with an EVAL barrier. (AB).

23850 (NEI-DK–1161) **District heating master plan study and assessment. Debrecen: Final report.** Danish Energy Consultants, Glostrup (Denmark). Apr 1993. [120p.] Contract IMOe-480;Contract ENS-2124/92-0001. Order Number DE93794747. Source: OSTI; NTIS.

The aim was to prepare estimates of the future heat demand in Debrecen, Hungary, and to calculate the economic consequences of improvements of the district heating system. The energy consumption in the area is ca. 30% higher than in Denmark. It is estimated that two thirds of this difference can be saved over a 20 year period if energy prices and tariffs rise to world market levels, if consumers pay in accordance with consumption and if installations are improved. If cogeneration plants (115 MJ) are introduced, over a 20 year period the net present value of the total costs for investments, operation and maintenance will decrease from 116 to 80 million US dollars. If steam demand is included, the optimal size of the cogeneration unit would be ca. 140 MJ's. This would further decrease net present value if steam demand remained stable. Improvements of the district heating network would decrease total costs by a further 10 million US dollars. The overall assessment of the district heating system is that existing production units, pipes and substations are in a reasonable condition, and that there is scope for further energy saving. Environmental considerations are

discussed and detailed recommendations are given. Relevant market, financial, and technical aspects are dealt with and principles of design and hydraulic calculations are presented in addition to a feasibility analysis. The latter gives an indication of which measures concerning the distribution system and heat consumption are economically viable and of the advantages of installing cogeneration plants as compared to retaining the use of existing boilers producing heat only. (AB).

23851 (NYSERDA–93-2) **Binghamton/Johnson City Joint Sewage Treatment Plant cogeneration project: Final report.** New York State Energy Research and Development Authority, Albany, NY (United States); SCS Engineers, Inc., West Nyack, NY (United States). Feb 1993. 167p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223.

This report describes a cogeneration system implemented at a wastewater treatment plant in Vestal, New York. The system consists of a 200 kW spark-ignited reciprocating engine driving an induction type electric generator. Also included in the system are two heat exchangers used to recover thermal energy from the engine. Thermal energy recovered is transferred to a system that heats wastewater sludge prior to the sludge being admitted to anaerobic digestion units. The digestion units produce the fuel used in the engine, a medium Btu fuel consisting primarily of methane and carbon dioxide, with a heating content of approximately 650 Btu per standard cubic foot. Use of the digester gas in the engine reduces the amount of excess digester gas burned in a flare. Electricity generated is used in the plant to reduce purchases from the electric utility. The report describes the unit operations at the plant and their energy uses, opportunities for saving energy, the cogeneration system equipment installed, implementation issues including capital costs and events during the 1986–1987 construction, results of operation during a 12 month period of monitoring, and an economic analysis of the project.

23852 (ORNL/CON–356) **Evaluation of the computerized utilities and energy monitoring and control system installed at the US Army, Europe, 222D Base Support Battalion, Baumholder, Germany.** Gettings, M.B.; Purucker, S.L. Oak Ridge National Lab., TN (United States). Nov 1992. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012427. Source: OSTI; NTIS; GPO Dep.

ORNL the utilities and energy monitoring and control systems (UEMCSs) installed at the 222D Base Support Battalion (BSB) at Baumholder, Germany. This evaluation relies on examination of existing data and information to determine the effectiveness of the UEMCSs. The Baumholder BSB consists of numerous installations located as far as 63 miles from the principal installation at Baumholder. Only five facilities within these installations currently have support from four essentially separate UEMCSs A Messner/Miles and two Honeywell systems, which combined have 4600 points serving 200 buildings, perform traditional UEMCS functions associated with district heating, while a Landis & Gyr UEMCS is used exclusively for electrical demand limiting and exterior lighting control. Total energy consumption at the community has steadily decreased since 1986 because of the implementation of UEMCS and the conversion to district heat. However, lack of annual energy consumption data by individual installation makes direct association of energy reductions to the implementation of specific UEMCSs difficult. Engineering estimates predict approximately a 6% annual energy savings associated with the UEMCSs of DM 1.9 million. However, less than 40% of the total community building area is connected. Opportunities for additional savings are available through (1) expanded use of demand limiting, (2) increased memory for the older Honeywell system to allow extending its application at the Smith Barracks facility and facilities nearby, (3) use of available UEMCS equipment to shut off the domestic hot water circulation pumps at night, (4) extension of UEMCS control at the Neubruecke Hospital complex, and (5) installation and utilization of heating hot water and potable hot water leak detection equipment. A moderate effort to track energy consumption by facility should be undertaken and data transmission lines associated with the UEMCS inspected and repaired.

23853 (ORNL/FTR–4403) **Evaluation of the energy-conservation effectiveness and utilization of the UEMCS installed at the 409th BSB in Germany: Foreign trip report, September 4–19, 1992.** Ruppel, F.R.; Broders, M.A. Oak Ridge National Lab., TN (United States). 9 Oct 1992. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011092. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An on-site evaluation of the energy-conservation effectiveness and utilization of the UEMCS installed at the 409th BSB in Germany was performed. On-site activities consisted of interviewing key UEMCS and energy-management personnel, touring facilities controlled by the UEMCS and other facilities with potential energy-conservation opportunities, and gathering historical thermal and electrical energy usage data for later analysis. Preliminary findings and recommendations were made on site.

23854 (UCRL-JC–110921) **Whistler wave driven plasma thruster.** Hooper, E.B.; Stallard, B.W.; Makowski, M.A. Lawrence Livermore National Lab., CA (United States). 5 Oct 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930103–39: 10. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 10-14 Jan 1993). Order Number DE93014122. Source: OSTI; NTIS; GPO Dep.

High density plasma can be generated by electron cyclotron resonance heating (ECRH) using whistler waves at densities for which the plasma frequency is much higher than the cyclotron frequency. This will result in a thruster operating at specific impulses of 10^3–10^4 s and much higher power and thrust densities than usual for ECRH devices. As the plasma generation is by electromagnetic waves, there are no electrodes, and wall material problems are greatly eased, permitting reliable, long lifetime operation. The authors report on the modeling of such a thruster, including plasma flow as well as losses to an end wall and ionization. A helical antenna to couple the waves into the plasma column is analyzed, including effects of the anisotropic plasma dielectric constant. An initial experiment to test the concept is planned.

While a gas turbine is expected as a future automotive engine for its high efficiency and multi-fuel applicability, achieving a thermal efficiency of 40% requires as high temperature as 1000°C at a combustor inlet. To make this temperature available, it is necessary to establish a new low-NOx combustion technology including pre-vaporing pre-mixing combustion. This paper describes investigations on flame stability and exhaust properties of light oil, cracked light oil, and methanol when the inlet temperature (T_a) was raised to 700°C using an experimental pre-vaporing pre-mixing combustor. Discussions were also given on possibility of reducing

NOx in each fuel. The flame stability was discovered in the order of wider combustion range as light oil > cracked light oil > methanol. The average temperature of the combustion gases under a test condition with T_a of 700°C was 1150°C for the light oil, 1100°C for the cracked light oil, and 1250°C for methanol. The exhaust NOx discharge coefficient was, when that for the light oil is set to 1, three for the cracked light oil, and 1/10 for methanol. 3 refs., 4 figs., 2 tabs.

23856 (CONF-9207203–, pp. 261-264) **Recent trend of automotive catalysts.** Sofukawa, H. (Toyota Central Research and Development Laboratories, Inc., Aichi (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. With the growing public concern over environmental problems and the improvement of automobiles in their performance, the role to be played by automative catalyst is being greatly enhanced. This paper explains the present status of ternary automative catalyst and problems to be solved in this matter. At present, monolith type ternary catalysts are predominently used and recently metal monolith carriers excellent in loading capacity and pressure loss are partly adopted. In usual ternary catalysts, base metal oxides such as Ce, La and Zr are used in addition to noble metals such as Pt, Pd and Rh. Rh is an indispensable element for reducing NO, and Pt is used for supplementing the oxidation activity of Rh because of its excellence in the low-temperature oxidation of CO and HC. CeO2 is loaded on all kinds of ternary catalysts so as to smooth the catalytic reaction in varying conditions of A/F ratio on account of its adsorptive-desorptive power for oxygen. Many problems relating to catalysts remain still unsolved and include enhancement of heat-resistance, improvement in low-temperature activity, lowering of the quantity of noble-metal carrier, removal of particulates and NOx, etc. 10 refs., 4 figs.

23857 (CONF-9207203–, pp. 269-272) **Reduction of NOx by copper catalyst loaded on brown coal.** Yamashita, H. (Tohoku University, Sendai (Japan). Institute for Chemical Reaction Science); Yamada, H.; Kyotani, T.; Tomita, A.; Radovic, L. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Development of a catalyst is requested which disintegrates NOx contained in the exhaust gas of diesel engines. The present paper describes the results of an experiment carried out for investigating the preparative conditions of Cu/brown coal char and its reaction mechanism, based on the results which were obtained before the time of a previous report and show that carbon loaded with metallic catalyst in the presence of oxygen is useful as reductant of NOx and so forth. Brown coal was impregnated and loaded with an aqueous solution of copper acetate and then converted to char in nitrogen atmosphere at 650°C. The standard amount of loaded substance was 2wt.% in terms of the amount of brown coal. A mixture of 1000ppm NO, 5% O2, and balance He was subjected to a reaction experiment around the conditions of 100ml/min, and 300°C. As a result, it was found that while carbon consumption decreases as the loaded amount of copper in the catalyst is decreased, the conversion rate of NOx does not decrease so much in the range of 2-0.5%; high charring temperature decreases the conversion activity of NOx and, at the same time, it gives possibility of elongating the life of carbon and so forth. 2 refs., 3 figs.

23858 (CONF-9207203–, pp. 273-276) **NOx reduction in diesel exhaust gas by using hydrocarbons.** Muramatsu, G. (Riken Corporation, Tokyo (Japan)); Abe, A.; Yoshida, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

It is an important problem to reduce the amounts of NOx and particulates exhausted from diesel engines. The present report clarifies NOx reduction characteristics of various kinds of hydrocarbons loaded on various catalysts and their catalytic reactions, and describes the results of an investigation on the practical use of a system using light oil and a Cu-based-group/Al2O3 catalyst. NOx reduction characteristics of Al2O3 catalyst loading various kinds of metal for a mixture of a hydrocarbon, or C3H6, NO, and O2 were examined and the priority of Cu-based catalyst was found. A comparisonal experiment using hydrocarbons ranging from C2 to C16 showed that ca. 30% reduction of NOx is obtained in the vicinity of 400°C by light oil mainly composed of C16 H34, suggesting practicability of such light oil together with its resistance against water vapor and SO2. Since the Cu-based-group/Al2O3 catalyst is characterized in its capability of simultaneous removal of NOx and particulates, its use together with light oil is expected to be effective, but such problem as enlargement of effective temperature region also remains. 8 refs., 4 figs.

23859 (CONF-9211101–9) **Low-expansion ceramics initiative.** Stinton, D.P. (Oak Ridge National Lab., TN (United States)); Richerson, D.W. Oak Ridge National Lab., TN (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual automotive development technology contractors' coordination meeting; Dearborn, MI (United States); 2-5 Nov 1992. Order Number DE93011860. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy and the Ceramic Technology Project support technology on low-thermal-expansion ceramics for application in advanced diesel and turbine engines. New activities are being initiated to accelerate the development of these materials. The strength of this program includes the integration of efforts of engine companies, ceramic manufacturers, and universities. This paper briefly describes the application of the low-expansion sodium-zirconium-phosphate (NZP) class of materials in engines and summarizes a 2-year program plan for this area.

23860 (ORNL/FTR–4301) **Travel to Germany to attend the 37th American Society for Mechanical Engineers gas turbine and aeroengine congress and exposition: Foreign trip report, May 29, 1992–June 10, 1992.** Tennery, V.J. Oak Ridge National Lab., TN (United States). 25 Jun 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011058. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended technical presential presentations on recent material developments relevant to gas turbines and to assess new alloys for gas turbines. Work on monolithic structural ceramics in gas turbines is at low ebb in Europe, with the only major efforts being in USA and, especially, Japan. Mechanical properties of these materials have undergone major improvement, particularly in the Si nitride type. Ti aluminides show promise for several applications, including compressor blades in high-performance aircraft turbines. Lack of reproducible mechanical properties and low-cost machining are hindering use of monolithic ceramics in aeroengines; continuous fiber- reinforced ceramic matrix composites have even greater problems. Fraunhofer IPT has technology for machining ceramics accurately. (DLC)

23861 (UCRL-JC–110069-Rev.1) **The intensity of knock in an internal combustion engine: An experimental and modeling study: Revision 1.** Cowart, J.S.; Haghooie, M.; Newman, C.E.; Davis, G.C.; Pitz, W.J.; Westbrook, C.K. Lawrence Livermore National Lab., CA (United States). Sep 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9210140–2-Rev.1: International fuels and lubricants meeting and exposition, San Francisco, CA (United States), 19-22 Oct 1992). Order Number DE93013089. Source: OSTI; NTIS; GPO Dep.

Experimental data have been obtained that characterize knock occurrence times and knock intensities in a spark ignition engine operating on indolene and 91 primary reference fuel, as spark timing and inlet temperature were varied. Individual, in-cylinder pressure histories measured under knocking conditions were conditioned and averaged to obtain representative pressure traces.

These averaged pressure histories were used as input to a reduced and detailed chemical kinetic model. The time derivative of CO concentration and temperature were correlated with the measured knock intensity and percent cycles knocking. The goal was to evaluate the potential of using homogeneous, chemical kinetic models as predictive tools for knock intensity.

3302 External Combustion Engines

23862 (NAL-TR–1149) **Studies on scramjet nozzles. 1.: Performance of two dimensional nozzles.** Miyajima, H. (National Aerospace Laboratory, Tokyo (Japan)); Mitani, T.; Sato, S.; Ueda, S.; Tani, K.; Hiraiwa, T.; Ito, K.; Kusaka, K.; Izumikawa, M.; Kisara, K.; Kumagai, T.; Saito, T.; Sakuranaka, N.; Takahashi, M.; Tanaka, A.; Yasu, S.; Higashino, K.;.National Aerospace Lab., Chofu, Tokyo (Japan). Apr 1992. 49p. (In Japanese). Order Number DE93793617. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

Investigations were made on performance of scram jet nozzles under a Mach 8 flight condition, using high temperature gas made from burning monomethyl-hydrazine and nitrogen tetraoxide. The test items included nozzle thrust, nozzle wall pressure distribution, pitot pressure, and static pressure distribution. A nozzle visualization experiment was also carried out. The analytic method used was the one JANNAF has applied for rocket nozzles. The following findings were obtained: This nozzle has a small thrust increment, but it corresponds to 1100 seconds as converted to a flow rate; nozzle flow fields were calculated using non-viscosity two-dimensional codes to verify the accuracy by comparing the results with experimental values; energy efficiency, non-equilibrium loss, and two-dimensional loss were identified from these calculations; core flow performance using these codes can be predicted with an accuracy of 4% or higher; the boundary layer in the case of using this combustion gas suggested a possibility of a laminar flow; and effect of radical activity loss reaction on the performance was investigated, by which the reaction mechanisms of nozzle flows were clarified. 73 refs., 40 figs., 5 tabs.

23863 (NAL-TR–1155) **Durability of a carbon segmented circumferential seal for a liquid oxygen turbopump.** Kikuchi, M. (National Aerospace Laboratory, Tokyo (Japan)); Oike, M.; Watanabe, Y.; Nosaka, M. National Aerospace Lab., Chofu, Tokyo (Japan). May 1992. 15p. (In Japanese). Order Number DE93793619. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

With an objective to improve durability of a helium purge seal used for the liquid oxygen turbopump in the LE-7 rocket engine, discussions were given on friction characteristics of a carbon segmented seal with Rayleigh steps. Five combinations of sealing materials were used on the static and the rotating sides. A simulated turbopump was used for the test. An increase in the purge pressure and a decrease in the runner rotation speed raise the pressing force acting on the carbon segments and accelerate wear in the carbon. Carbon materials with superior mechanical properties do not necessarily exhibit good friction characteristics. An MoS2 film existing between the seal faces works effectively to reduce wear in the carbon segments. A combination of a runner of plasma sprayed Cr2O3 film with with a seal of the MoS2 sprayed film showed excellent durability under a wide range of test conditions because of good friction compatibility in both materials. It was verified that good correlation existed between a pin-rotating disk type friction testing machine and a seal testing machine. 10 refs., 17 figs., 7 tabs.

23864 (NAL-TR–1174T) **Numerical calculation of scramjet inlet flow.** Ishiguro, T. (National Aerospace Laboratory, Tokyo (Japan)); Ogawa, S.; Wada, Y. National Aerospace Lab., Chofu, Tokyo (Japan). Jul 1992. 29p. Order Number DE93793626. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

The numerical calculation procedure was proposed to analyze scramjet inlet flowfields. In order to accurately treat boundary conditions such as wall and edge, all boundaries were mapped onto certain parts of the faces of three rectangular parallelepipeds, and a computational space was made by connecting them. The 3-D full Navier-Stokes equations were solved by applying a TVD scheme to uniform mesh points of the space. The influence of various parameters on inlet performance (mass capture ratio, total pressure recovery ratio, possibility of starting) was discussed assuming freestream Mach numbers (M) of 2-10, sweep angles of a side plate leading edge of 0-60°, and entrance/throat contraction ratios (R) of 3-10 as parameters. As a result, the calculation results well agreed with the experimental ones at M = 4 in starting, where iterated reflective oblique shock waves made by wedges of side panels decelerated and compressed air. Unstarting phenomenon was observed in the case of either low M or high R. 22 refs., 40 figs.

23865 (UCRL-CR–109570) **Test results of a pumped monopropellant propulsion system.** Maybee, J.C. (Rocket Research Co., Redmond, WA (United States)); Brewster, G.T.; Swink, D.G. Lawrence Livermore National Lab., CA (United States); Rocket Research Co., Redmond, WA (United States). 31 Jan 1992. 26p. Sponsored by USDOE, Washington, DC (United States). A breadboard demonstration of a pumped monopropellant propulsion system was completed during 1991. The propulsion system is the central part of the miniaturized maneuvering vehicle design presented and discussed in previous papers. Progress during 1991 included testing at the subsystem level to demonstrate the bootstrap startup capability of the design, and testing at the system level of a bolt-down breadboard unit which consisted of the warm gas pumps, gas generator, propellant tanks, thrust control valve assembly, regulator, bridge structure, attitude control thrusters, and two 56-lbf hydrazine thrusters. These two test series demonstrated the viability of the concept and results are presented and discussed from each test. The test results and post-test correlations with a mathematical model have resulted in refinements to component specifications.

The usefulness and feasility of solar bike (bicycle) were discussed by experimentally building up its prototype and measuring its energy consumption, regenerative power and traveling performance. Photovoltaic (PV) cells, motor, controller and batteries were mounted on the bicuycle as a vehicle, which was proposed by a given name of 'Super Solar Bike (SSB)'. Power which is diurnally generated by the PV cells fitted on the front and rear wheels during the travelling, and the other ones fitted with protrusion in addition to the above ones during the parking is reserved in Ni-Zn batteries for being used as power for the driving use motor. At the time of deceleration, kinematic energy of vehicle body is converted into electric energy and then recovered. It was known that the power which was obtained from the PV cells fitted on the wheels during the traveling was about 16W and that the energy daily recoverable was about 230Wh during the parking. As a result of simulation, the prototype vehicle was 0.57 in transmission efficiency. The distance travelable by one time of charging was 123km on the even road. 4 refs., 6 figs., 3 tabs.

23867 (DOE/CE/50337–T1) **Technology assessments of advanced energy storage systems for electric and hybrid vehicles.** Abacus Technology Corp., Chevy Chase, MD (United States). 30 Apr 1993. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91CE50337. Order Number DE93014395. Source: OSTI; NTIS; GPO Dep.

Flywheels, hydropneumatic accumulators (in vehicles with a hydrostatic powertrain), and superconducting magnets were assessed as candidate technologies for recovering braking energy and averaging power demands in electric and hybrid vehicles. The technologies were also assessed for their suitability for fulfilling the entire energy storage requirement in vehicles. The scope of the technology assessments included the current state-of-the-art and developments anticipated within the next few years in the US and abroad. Key individuals and companies currently working on each technology contributed technical information to the study. Some of these individuals and companies are nearing the pre-production prototype stage with systems suitable for automobiles. Several have constructed systems using similar technology for other applications, including satellites and industrial equipment.

23868 (DOE/NV/10649–T1) **Research development and demonstration of a fuel cell/battery powered bus system: Annual report, January 1, 1992–December 31, 1992.** Romano, S.; Wimmer, R. Georgetown Univ., Washington, DC (United States). 4 Feb 1993. 218p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-87NV10649. Order Number DE93013778. Source: OSTI; NTIS; INIS; GPO Dep.

During 1992, the design of the three test bed buses evolved. Georgetown participated in all the working meetings and the preliminary design review of the Test Bed Bus (TBB). Throughout the Year, Georgetown provided input on system design and integration issues, transit industry requirements, and bus performance. GU also attended technical seminars, presenting papers at two. The computer simulation "HYBRID", developed by Georgetown, was used to assess performance of different bus designs and system control algorithms. GU also modified the simulation to be more flexible and allow easier evaluation Of designs. Georgetown had Exhibitgroup design and construct, to our specifications, a fuel cell bus display with a 1/10 scale model of the TBB for use at trade shows and exhibits. Energy Partners Of West Palm Beach, Florida completed their subcontract for the engineering design study of a hydrogen fueled, fuel-cell-powered multi-passenger vehicle. Georgetown performed a study to determine the size of the US bus fleet and expected new bus deliveries over the next 10 years. Trojan Battery Company of Santa Fe Springs, California conducted a study to determine the specific design characteristics required of a leadacid battery to meet the special requirements posed by hybrid vehicle operation. Finally, GU assisted the prime contractor with the design of the system controller and its control algorithms.

23869 (EGG-EP–9831) **Study of long term options for electric vehicle air conditioning.** Dieckmann, J. (Little (Arthur D.), Inc., Cambridge, MA (United States)); Mallory, D. EG and G Idaho, Inc., Idaho Falls, ID (United States); Little (Arthur D.), Inc., Cambridge, MA (United States). Jul 1991. 151p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013588. Source: OSTI; NTIS; GPO Dep.

There are strong incentives in terms of national energy and environmental policy to encourage the commercialization of electrically powered vehicles in the U.S. Among these incentives are reduced petroleum consumption, improved electric generation capacity utilization, reduced IC engine emissions, and, depending on the primary fuel used for electric power generation, reduced emissions of carbon dioxide. A basic requirement for successfully commercializing any motor vehicle in the US is provision of adequate passenger comfort heating and air conditioning (cooling). Although air conditioning is generally sold as optional equipment, in excess of 80% of the automobiles and small trucks sold in the US have air conditioning systems. In current, pre-commercial electric vehicles, comfort heating is provided by a liquid fuel fired heater that heats water which is circulated through the standard heater core in the conventional interior air handling unit. Air conditioning is provided by electric motor driven compressors, installed in a system having, perhaps, an "upsized" condenser and a standard evaporator (front and rear evaporators in some instances) installed in the conventional interior air handler. Although this approach is adequate in the near term for initial commercialization efforts, a number of shortcomings of this arrangement, as well as longer range concerns need to be addressed. In this project, the long term alternatives for cooling and heating electric vehicles effectively, efficiently (with minimum range penalties), and without adverse environmental impacts have been examined. Identification of options that can provide both heating and cooling is important, in view of the disadvantages of carrying separate heating and cooling systems in the vehicle.

23870 (CONF-921275–, pp. 1-2) **Evaluation on reliability of air-bag ignition device.** Saito, Y. (Yokohama National University, Yokohama (Japan)); Miyake, A.; Ogawa, T.; Kojima, Y.; Shimosada, H. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

A non-destructive test was carried out on an ignition device for an automotive air-bag system to evaluate its reliability. A thermal transient testing method was developed that gives constant micro current pulses to the ignition device to observe voltage change in the bridge circuit on an oscilloscope. The voltage change indicates temperature rise at the bridge, where the energy given to the bridge as a result of the energization is the sum of heat dissipation to the igniting powder and the temperature rise in the bridge. The collective coefficient for heat transfer between the igniting powder and the bridge is an important element to determine performance of the ignition device. The present test method was applied to ignition devices with structural defects to compare the result with the data for normal products. The defective products had the voltage change distribution that largely differ from that for the normal products, while probability density functions were derived for the voltage change amount, respectively. The functions were used to set the voltage change amount that the relative frequency of defect occurrence becomes 0.0001% or lower as the determination criterion. The results of tests using this method were compared with those from actual ignition tests, and the reasonability of the determination criterion was verified. 3 figs., 1 tab.

23871 (CONF-921275–, pp. 159-160) **Measurement of flash point and ignition point of brake fluids.** Hara, M. (Kanagawa Prefectural Government, Yokohama (Japan)); Ikeda, Y.; Kawakami, A. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Brake fluids were added to distilled water to investigate relation between the boiling points, flash points, and ignition points to discuss possibilities of automobile fire occurrence. The boiling points were 250°C or higher at a water content of 0%, except for one brand, which decreased with the higher the water content, while the flash points rose with increasing water content. On the other hand, it was found that the experimental expression to infer a flash point from a boiling point cannot be applied to brake fluids. The ignition points rose with increasing water content. As a result of measuring temperatures in an exhaust manifold and other parts of a passenger car driven on an upslope, the temperature in the exhaust manifold reached 315°C and in the exhaust pipe 262°C during acceleration for passing. It was also reported that as a result of measuring temperatures in a braking system in a car driven on a downslope, the temperatures were 230°C in the front wheels, 900°C in the disk-brake pads, and 650°C in the rotors. This would mean that if brake fluid leaks and deposits on high-temperature parts such as an exhaust manifold, the brake fluid may ignite. 4 refs., 4 figs.

23872 (CONF-9207203–, pp. 209-214) **Deep desulfurization from light oil.: Its recent trend.** Kabe, T. (Tokyo University of Agriculture and Technology, Tokyo (Japan). Faculty of Technology). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting*

of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting. Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

With air pollution caused from diesel engine exhausts having become serious, development of highly active catalysts is wanted strongly that can operate under deep desulfurizing conditions in order to achieve the governmental target of S content at 0.05% by weight. However, there are many unclear points remaining in the reaction mechanisms under deep desulfurizing conditions. This paper describes processes to reduce sulfur compounds produced along with deep desulfurization from light oil, the reaction mechanisms, and guidelines for catalyst development. From results of detailed analyses of material oils and those desulfurized at a temperature from 350°C to 390°C it was found that alkyldibenzothiophene is difficult to remove sulfur, and especially 4-methyldibenzothiophene remain even at 390°C because of the substitutional groups preventing the compound from getting closer to the catalyst surface. Effects of these substitutional groups and solvents were investigated kinetically. Several important guidelines were presented including isomerization of methyldibenzothiophenes as a guideline for developing deep desulfurization catalysts. 5 refs., 11 figs.

23873 (CONF-9207203–, pp. 241-244) **Combustion and smoke formation characteristics and their mechanisms in D.I. diesel engines.** Fadzili, a. (Hokkaido University, Sapporo (Japan). Faculty of Engineering); Chikahisa, T; Murayama, T.; Tosaka, S.; Fujiwara, Y. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

This paper discusses combustion and smoke formation characteristics in diesel engines as clarified in the previous report which investigated the optimal conditions for fuel injection systems and swirl. The water cooled single cylinder direct fuel injection four-cycle diesel engines used for the experiment included a flat type combustion engine with a bore of 85 mm and flat pins, and a basin type combustion engine with a bore of 125 mm and toroidal type cavity. Combustion trends were compared varying the swirl ratio, the number of injection holes, and total injection hole area, from which the following findings were obtained: with the flat type combustion chamber, the change trends in heat generation and exhaust smoke correspond well with each other; these changes that result from varying number of nozzle injection holes and the swirl can be predicted from a theory based on introducing air in a Jet flow; and an engine with a cavity tends to produce a large amount of smoke at the top clearance, often generating much smoke even though the heat generation efficiency is high, where a qualitative prediction is also possible. 3 refs., 2 figs.

23874 (CONF-9207203–, pp. 245-246) **Non-combustive gasification of KOH-treated fuel soot.** Saito, Y. (Ibaraki College of Technonology, Ibaraki (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Removal of carbon particles (soot) from automobile exhaust using a trap renders a problem of post-treatment thereof. With an objective of converting the soot into C1 compounds other than CO2 using non-combustive gasification, this paper describes an investigation on effect of alkaline treatment of carbon. Soot was poured with alkaline aqueous solution added with a surfactant, kneaded into paste, added with the remaining aqueous solution, evaporated, dried, and washed with water, and then subjected to a gasification reaction. The material was charged into a U-letter shaped reaction tube, deaerated, and then gasified through water and accompanying gases (CO2 and He). It was found that CO and H2 generating velocity becomes several ten times faster as a result of adding KOH in the water gas reaction of either H2O/He system or H2O/CO2 system. The DTA-TG measurements revealed that KOH accelerates combustion of soot in air and steam adsorption. Methanizing decomposed gases is possible, but loss of catalytic activity cannot be neglected. 1 fig., 1 tab.

23875 (CONF-9207203–, pp. 251-254) **Carbon-dioxide free gasoline fueled car.** Korematsu, K. (Kogakuin University, Tokyo (Japan)); Watabe, M.; Saika, T.; Iizuka, H.; Kitada, T.; Muramatsu, S. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The contribution of automobiles to CO2 discharge in Japan reaches almost 18%. Under an assumption that an absorber is installed in the exhaust system in an automobile as one method to reduce CO2 emission, a test was given on emission reduction using absorbent liquids. As a preliminary test, CO2 was passed through several kinds of absorbent liquid including NaOH Na2CO3 and K2CO3 to measure CO2 amount before and after absorption. From the result, mono-ethanol amine (MEA) was selected. An absorbing device containing MEA aqueous solution (with a concentration of 2 or 4 mol/l and at an amount of 50 liters or 100 liters) was connected to an exhaust system, and a city driving experiment was carried out. As a result of measuring the CO2 concentration of the solution at every 10 km, the solution absorption pattern was such that it absorbed about 80% of the emission amount in a drive distance of up to 80 km, and lost the absorption activity at a distance of 120 km when 100 liter solution of 4mol/l was used. Even this simple device was verified to exhibit an effect of emission reduction. 2 refs., 4 figs., 1 tab.

23876 (CONF-9207203–, pp. 255-258) **Catalytic engine.** Yagi, M. (Advanced Combustion Engineering Institute, Tokyo (Japan)); Tsujimura, K. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

This paper proposes a new system concept to try a large reduction in exhaust emission from a combustion process in a diesel engine by utilizing catalytic chemistry, and reports study situations in technologies for basic reactions as the core of the concept. This system consists of a reforming device to generate H2 from partial oxidation of light oil, an H2 separating device, an NH3 synthesizing device, an NH3 storing device, an NH3 adsorbing device, an NOx reducing device, and a CO gas injecting device. It is intended to use NH3 synthesized from light oil using the above system as a reducing agent for NOx. While macromolecular hollow fiber membranes were used to separate H2 from CO in the gas generated from partial combustion, Pd membranes are also being given discussions. The NH3 synthesis used an Ru/Cs2 O/Al2O3 catalyst, which was proved strong against CO poisoning under normal pressure reaction. The NOx reduction used a vanadium catalyst, which showed very high reducing rates and durability in a driving experiment and exhibited a possibility of application. 3 refs., 5 figs., 2 tabs.

23877 (CONF-9207203–, pp. 259-260) **Study in deNOx catalysts for lean-burn gas engines.** Takahashi, I. (Tokyo Gas Co. Ltd., Tokyo (Japan)); Yamaseki, K.; Uchida, H. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Development is being moved forward on a lean-burn gas engine using as a fuel the natural gas, a clean energy. This paper describes investigations on performance of metal loaded Mordenite catalyst as an NOx removing catalyst for such an engine by using simulated exhaust gas containing an abundance of oxygen and steam. The catalyst was prepared with different metals (Co, Rh, Pd, Ag, Cu, and Fe) using an ion-exchange or impregnation process. The exhaust gas composition was composed of predetermined amounts of NO, CO, CO2, O2, and H2O added with CH4 or

city gas or C3H6 at 0 to 3000 ppm. The gas was reacted in a fixed bed flow reactor at 673 K and under SV = 44000/h, where the following findings were obtained: in the case where hydrocarbon is CH4, the metal loaded Mordenite showed NOx removing activity, and the Co catalyst showed the highest NOx removal rate. Adding a city gas in place of the hydrocarbon improved the NOx removal rate. 2 refs., 2 tabs.

23878 (CONF-9207203–, pp. 277-280) **Selective reduction of nitrogen oxide over metal ion-exchanged silicoaluminophosphate (SAPO) catalysts.** Takita, Y. (Oita University, Oita (Japan). Faculty of Engineering); Kagawa, M.; Mizuhara, Y.; Ishihara, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Silicoaluminophosphate(SAPO) is porus material having a crystalline structure similar to that of zeolite and it was shown in the study up to the previous report that Cu-SAPO-34 has a very high activity for selective reduction of NOx. The present paper discusses its resistance to heat and describes the results of an investigation on the selective reduction of NOx in an oxidizing atmosphere using C3 H6 as reductant over SAPO-34 ion-exchanged with various metals. In addition, MeAPSO-34 obtained by introducing metallic atoms into the lattice of SAPO-34 was investigated. Heat-resistance of metal ion-exchanged SAPO was judged by examining the change of its selective reduction activity for NO after it is subjected to heat treatment over 500-800°C in humidified atmosphere. While its activity is decreased by heat-treatment, it exhibited heat resistance superior to other kinds of catalysts(ZSM-5). It was found that introduction of metallic atoms into a lattice gives a high activity for disintegrating NO irrespective of a small amount of metal. 5 refs., 5 figs.

23879 (CONF-9207203–, pp. 281-282) **Selective reduction of nitrogen monoxide in oxidizing atmosphere over transition metal ion-exchanged zeolite catalysts.** Mizuno, N. (Hokkaido University, Sapporo (Japan). Catalysis Research Center); Yahiro, H.; Iwamoto, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Use of a ternary catalyst for removing NO in the exhaust gas of diesel engines or lean-burn gasoline engines has been difficult because of high concentration of remaining oxygen. The present report describes the results of an investigation on the selective reducing reaction of NO by ethene on various transition metal ion-exchanged zeolite catalysts. The catalysts were prepared by the ordinary method and ZSM-5 (abbreviated to Z) or the like were used as zeolite matrix. Measurements were carried out in the range of 473-973K for the ordinary-pressure circulation of 1000ppm NO, 250ppm C2H4, and 2% O2. The reaction on a cation-exchanged Z showed that the active temperature region for NO removal changes greatly depending on the species of the cation and Cu, Co, H, Ag and Zn gave high removal rates; especially the activity of Cu-Z was high at the lowest temperature. Cu-Z 105(ion-exchange rate) showed adaptability to high GHSV and resistances to water vapor and SO2. 10 refs., 1 fig., 1 tab.

23880 (CONF-9207203–, pp. 283-286) **Selective reducing reaction of NO using zeolite-based catalyst.** Yogo, K. (Waseda University, Tokyo (Japan). School of Science and Engineering); Ihara, M.; Umeno, M.; Terasaki, I.; Watanabe, H.; Kikuchi, E. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Since priority is given to the reaction between hydrocarbon and oxygen in diesel engine exhaust gas or the like where oxygen concentration is high and the selective reduction of NO is difficult, the development of catalyst of superior quality is getting important. This paper describes the results of a study on the reaction in which C2H4 rich in automobile exhaust gas is used as reductant using a Ga-loading zeolite catalyst. Several kinds of catalysts including ZSM-5 were investigated. The reaction was carried out in the conditions that the reaction temperature is 300-600°C; the concentrations of NO, C3H8 and C2H4, and O2 are 1000ppm, 167-1000ppm and 2.1%, respectively. A high NO removal rate of Ga-ZSM-5(the figure shows ion-exchange rate) was recognized over a wide range of temperature compared with the case where Cu or other species of metal were used. Even when the loading amount of Ga was increased upto 6wt.%, no change was found in NO conversion rate. This catalyst shows a high NO conversion rate compared with Cu-ZSM-5 in a high SV condition. 5 refs., 4 figs.

23881 (CONF-9207203–, pp. 287-290) **Selective reduction of NO on noble metal supported catalysts.** Oi, A. (National Institute for Resources and Environment, Tsukuba (Japan)); Obuchi, A.; Nakamura, M.; Ogata, A.; Mizuno, K.; Ouchi, H. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Various kinds of catalysts are actively reported for reducing NO in the conditions of excessive oxygen as in diesel engine exhaust gas. The present report describes the results of an examination on the activity of noble metal supported catalysts for selective reduction of NO using mock-up gas and actual diesel exhaust gas. The catalysts used were prepared by supporting basically 1% of Rh, Ru, Pd, Ir and Pt on respective powdery-γ -alumina carriers. The reaction gas is composed of 995ppm of NO, 870ppm of C3H8, 5% of O2 and the balance He, and used for the examination at 200-400°C. Besides, an activity test using actual exhaust gas was carried out. Summarized conclusions are as follows Catalysts supporting noble metal including Pt exhibit a comparatively high activity in actual exhaust gas test and the drop of activities was slight after a five-hour continuous test. It is however supposed from the results of test using a mock-up gas that N2O is generated. Improvement in this respect was judged to be necessary. 8 figs.

23882 (UCRL-JC–111555) **Pulsed plasma processing for control of diesel engine emissions.** Vogtlin, G.E.; Freytag, E.K.; Bardsley, J.N.; Wallman, H. Lawrence Livermore National Lab., CA (United States). 12 Feb 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211101–8: Annual automotive development technology contractors' coordination meeting, Dearborn, MI (United States), 2-5 Nov 1992). Order Number DE93011884. Source: OSTI; NTIS; GPO Dep.

Electrical discharges can be used as an after treatment for diesel exhaust. We are presently involved in research to determine the feasibility of this process. These discharges have been shown to remove nitric oxide, sulfur dioxide, particulates and many organic compounds. A key issue is the efficiency of this removal since it effects both capital and operating costs. These discharges must be of short duration, less than one microsecond, to avoid energy losses due to heating of bulk gas molecules. The voltage must be kept below the voltage breakdown limit where ion heating creates an arc discharge. The basic process is the acceleration of electrons which then collide with gas molecules to form radicals such as O and OH. These radicals then react with and eliminate pollutants. Two basic electrode geometries are used to generate these discharges. The barrier discharge is when one or both of the electrodes is insulated and the pulse length is limited by charging of the insulator. This discharge must be driven by alternating current to permit alternating charging of the insulator. The other geometry is when one electrode has a peak voltage stress five or more times the average stress. We have been investigating the high stress geometry which uses a small wire inside a pipe. The principal experimental apparatus utilized by this effort uses a closed loop gas system. This system permits the production of various gas combinations prior to testing. Analysis can be conducted during or after these tests. The recirculated gas can be heated up to 400 degrees Fahrenheit. This system can measure the energy

used and the pollutant removal to determine efficiency. Our primarily goal is the simultaneous removal of nitric oxide and particulates typical of diesel exhaust. This is expected to be accomplished in one or more metal tubes no larger than two inches in diameter and thirty-six inches long.

The introduction of natural gas to the transportation energy sector offers the possibility of displacing imported oil with an indigenous fuel. The barrier to the acceptance of natural gas vehicles (NGV) is the limited driving range due to the technical difficulties of on-board storage of a gaseous fuel. In spite of this barrier, compressed natural gas (CNG) vehicles are today being successfully introduced into the market place. The purpose of this work is to demonstrate an adsorbent natural gas (ANG) storage system as a viable alternative to CNG storage. It can be argued that low pressure ANG has reached near parity with CNG, since the storage capacity of CNG (2400 psi) is rated at 190 V/V, while low pressure ANG (500 psi) has reached storage capacities of 180 V/V in the laboratory. A program, which extends laboratory results to a full-scale vehicle test, is necessary before ANG technology will receive widespread acceptance. The objective of this program is to field test a 150 V/V ANG vehicle in FY 1994. As a start towards this goal, carbon adsorbents have been screened by Brookhaven for their potential use in a natural gas storage system. This paper reports on one such carbon, trade name Maxsorb, manufactured by Kansai Coke under an Amoco license.

23884 (DOE/PC–93007525, pp. 26-33) **Oxygenate liquid transportation fuels.** USDOE Pittsburgh Energy Technology Center, PA (United States). 1993. In *PETC Review: Issue 7, Winter 1992–1993.* 52p. Order Number DE93007525. Source: OSTI; NTIS.

Almost one-half of the American population lives in cities that currently do not meet the EPA standard for ozone, a major contributor to urban smog that results from reactions of automobile emissions in the atmosphere under the influence of sunlight. Previous approaches to controlling automobile emissions have focused almost exclusively on redesigning the engine and exhaust system. The Clean Air Act Amendments of 1990 expanded that focus to include investigating alternative fuels for internal combustion engines because there are fuels that burn more completely and efficiently than do conventional gasoline and diesel fuels and are, therefore, much less polluting. In addition to the Clean Air Act Amendments, another law - the Alternative Motor Fuels Act (AMFA) of 1988 - has a its purpose to help achieve energy security, improve air quality, and encourage the production of methanol-, ethanol-, and natural-gas powered motor vehicles by encouraging the development and widespread consumer use of methanol, ethanol, and natural gas as transportation fuels. Many potentially clean vehicle fuels have been identified, including natural gas, hydrogen, propane, and electricity. Each of these has advantages but none appears to be readily available for the mass market. Nevertheless, one group of clean fuels - the oxygenate liquid transportation fuels, or oxygenates - does seem to offer immediate short-term benefits and can be produced from coal. The advantages of these fuels are discussed.

23885 (NREL/TP–422-5259) **Biodiesel/Aquatic Species Project report, FY 1992.** Brown, L. (National Renewable Energy Lab., Golden, CO (United States)); Jarvis, E.; Dunahay, T.; Roessler, P.; Zeiler, K.; Sprague, S. National Renewable Energy Lab., Golden, CO (United States). May 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010024. Source: OSTI; NTIS; GPO Dep.

The primary goal of the Biodiesel/Aquatic Species Project is to develop the technology for growing microalgae as a renewable biomass feedstock for the production of a diesel fuel substitute (biodiesel), thereby reducing the need for imported petroleum. Microalgae are of interest as a feedstock because of their high growth rates and tolerance to varying environmental conditions, and because the oils (lipids) they produce can be extracted and converted to substitute petroleum fuels such as biodiesel. Microalgae can be grown in arid and semi-arid regions with poor soil quality, and saline water from aquifers or the ocean can be used for growing microalgae. Biodiesel is an extremely attractive candidate to fulfill the need for a diesel fuel substitute. Biodiesel is a cleaner fuel than petroleum diesel; it is virtually free of sulfur, and emissions of hydrocarbons, carbon monoxide, and particulates during combustion are significantly reduced in comparison to emissions from petroleum diesel. Biodiesel provides essentially the same energy content and power output as petroleum-based diesel fuel.

35 ARMS CONTROL

23886 (SAND–93-1027C) **Waste component recycle, treatment, and disposal integrated demonstration (WeDID) nuclear weapon dismantlement activities.** Wheelis, W.T. Sandia National Labs., Albuquerque, NM (United States). 12 Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930483–4: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993). Order Number DE93012862. Source: OSTI; NTIS; INIS; GPO Dep.

One of the drivers in the dismantlement and disposal of nuclear weapon components is Envirorunental Protection Agency (EPA) guidelines. The primary regulatory driver for these components is the Resource Conservation Recovery Act (RCRA). Nuclear weapon components are heterogeneous and contain a number of hazardous materials including heavy metals, PCB'S, selfcontained explosives, radioactive materials, gas-filled tubes, etc. The Waste Component Recycle, Treatment, Disposal and Integrated Demonstration (WeDID) is a Department of Energy (DOE) Environmental Restoration and Waste Management (ERWM) sponsored program. It also supports DOE Defense Program (DP) dismantlement activities. The goal of WeDID is to demonstrate the end-to-end disposal process for Sandia National Laboratories designed nuclear weapon components. One of the primary objectives of WeDID is to develop and demonstrate advanced system treatment technologies that will allow DOE to continue dismantlement and disposal unhindered even as environmental regulations become more stringent. WeDID is also demonstrating waste minimization techniques by recycling a significant weight percentage of the bulk/precious metals found in weapon components and by destroying the organic materials typically found in these components. WeDID is concentrating on demonstrating technologies that are regulatory compliant, are cost effective, technologically robust, and are near-term to ensure the support of DOE dismantlement time lines. The waste minimization technologies being demonstrated by WeDID are cross cutting and should be able to support a number of ERWM programs.

23887 (UCRL-ID–108162) **The utility and role of treaties in Nuclear Arms Control.** Greb, A. Lawrence Livermore National Lab., CA (United States). Aug 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012449. Source: OSTI; NTIS; GPO Dep.

This report contains information on research projects and activities for the period 1989-1990. The compilation of abstracts and attachments contain information on the historical aspects of US decision making on arms control, the peaceful uses of nuclear explosives, and the value of the Limited Test Ban Treaty. Also, a draft proposal for a workshop on the subject of National Security Decision Making in the 1950s is included.

3501 Policy, Negotiations, and Legislation

23888 (INIS-mf–13520) **Disarmament. Newsletter. V. 11, no. 1.** United Nations, New York, NY (USA). Dept. for Disarmament Affairs. Feb 1993. [16p.] Order Number DE93624714. Source: OSTI; NTIS (US Sales Only); INIS.

The newsletter presents materials covering the following subjects: signing of START 2 treaty by Russia and the United States; arms regulation and disarmament in the post-cold war area; accession of new countries to the Non-Proliferation Treaty; trends towards fewer nuclear-weapon tests.

23889 (SAIC–93011823) **Trends and developments in the proliferation of ballistic missiles and weapons of mass destruction seminar, February 17, 1993: Final report.** Murray, B.L.; Hallenbeck, R.A.; Gill, J.M. Science Applications International Corp., McLean, VA (United States). 8 Apr 1993. 42p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); Arms Control and Disarmament Agency, Washington, DC (United States). Order Number DE93011823. Source: OSTI; NTIS; GPO Dep.

This seminar provided an overview on the proliferation of nuclear, chemical and biological weapons as well as missiles and missile technology, and set the stage for subsequent seminar meetings of the 1993 program. A multiplicity of factors – different nations, regions, and capabilities – is making dealing with proliferation increasingly complicated. Additionally, recent or upcoming world events introduce further uncertainty into proliferation calculations. These proliferation accelerators and decelerators, will greatly shape and define the overall proliferation picture. These factors combine to raise a whole new series of stability issues which require new analyses and approaches for managing proliferation in the post-Cold War era. While technology cannot alone solve the proliferation problem, a particularly promising application is in new information technologies and interactive information management systems. A proliferation information network could be used to fuse large amounts of information and data on exports; license; treaty reporting, notifications, and other obligations; dual use technologies and related scientific advances; and others information of proliferation relevance. This type of network could use readily available technologies, would be simple to use and relatively inexpensive to create and maintain, and could be made available to almost of all of the nations of the world.

3502 Proliferation

This report includes information concerning: the Department of Energy's Office of Arms Control and Nonproliferation; the nuclear inspections in Iraq, lessons for verification; detection technologies needed for each step of nuclear weapon development; nuclear proliferation problems; strengthening the nuclear reactor fuel cycle against proliferation; monitoring using unattended remote nondestructive assay; seismic monitoring in a proliferation environment; forensic science center, remote infrared spectrometry for nonproliferation applications; and acoustic instrument for identifying chemical munitions.

23891 (UCRL-ID–111040) **Potential CIS/Russian targets.** Speed, R.D. Lawrence Livermore National Lab., CA (United States). Jun 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012441. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This paper (based on the limited unclassified literature available) describes potential target sets in the Commonwealth of Independent States (CIS) and Russia. If in the future the CIS or Russia should revert to a posture of hostility, it is estimated that the capability to deliver on target a few hundred nuclear weapons should be sufficient for deterrence.

23892 (UCRL-ID–111207) **Non-proliferation and GPALS: The French and German views.** Zinner, P.E. Lawrence Livermore National Lab., CA (United States). Jun 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012443. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this report is to record and analyze attitudes in France and Germany toward nuclear proliferation and register reactions in the two countries to a US initiative designed to enlist their support for the development and deployment of GPALS (Global Protection Against Limited Strikes). The data for this report was collected in personal interviews I conducted during March 1992 in France and Germany. My respondents included government officials, military personnel (in Germany only), and knowledgeable experts outside government service. In addition, I perused numerous French and German language daily newspapers, periodicals, and research publications.

3503 Verification

23893 (LA–12546-MS) **Instrumentation and procedures for moisture corrections to passive neutron coincidence counting assays of bulk PuO_2 and MOX powders.** Stewart, J.E. (Los Alamos National Lab., NM (United States)); Menlove, H.O.; Ferran, R.R.; Aparo, M.; Zeppa, P.; Troiani, F. Los Alamos National Lab., NM (United States); ENEA, Saluggia (Italy). Centro Ricerche Energia. May 1993. 33p. Sponsored by USDOE, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States); Department of State, Washington, DC (United States); Arms Control and Disarmament Agency, Washington, DC (United States). DOE Contract W-7405-ENG-36. (ISPO–351). Order Number DE93013599. Source: OSTI; NTIS; INIS; GPO Dep.

For passive neutron-coincidence-counting verification measurements of PuO_2 and MOX powder, assay biases have been observed that result from moisture entrained in the sample. This report describes a unique set of experiments in which MOX samples, with a range of moisture concentrations, were produced and used to calibrate and evaluate two prototype moisture monitors. A new procedure for moisture corrections to PuO_2 and MOX verification measurements yields MOX assays accurate to 1.5% (1σ) for 0.6- and 1.1-kg samples. Monte Carlo simulations were used to extend the measured moisture calibration data to higher sample masses. A conceptual design for a high-efficiency neutron coincidence counter with improved sensitivity to moisture is also presented.

23894 **Detection device for high explosives.** Grey, A.E.; Partin, J.K.; Stone, M.L.; Von Wandruslka, R.M. To Dept. of Energy. 1991. Filed date 28 May 1991. USA patent application 7-707,414. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93011994. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a portable fiber optic detector that senses the presence of specific target chemicals by electrostatically attracting the target chemical to an aromatic compound coating on an optical fiber. Attaching the target chemical to the coated fiber reduces the fluorescence so that a photon sensing detector records the reduced light level and activates an appropriate alarm or indicator.

23895 (SAND–93-1125C) **The Authenticated Tracking and Monitoring System (ATMS) concept.** Schoeneman, J.L.; Fox, L.J.; Jenkins, C.D. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930533–1: 15. annual symposium of the European Safeguards Research and Development Association: safeguards and nuclear materials management, Rome (Italy), 11-13 May 1993). Order Number DE93013775. Source: OSTI; NTIS; GPO Dep.

One of the proposed applications of the satellite-based Global Verification and Location System (GVLS) is the Authenticated Tracking and Monitoring System (ATMS). When fully developed, ATMS will provide the capability to monitor, in a secure and authenticated fashion, the status and global tracking of selected items while in transit - in particular, proliferation sensitive items. The

resulting tracking, timing, and status information can then be processed and utilized to assure compliance with, for example, various treaties. Selected items to be monitored could include, but are not limited to, Treaty Limited Items (TLIs), such as nuclear weapon components, Re-entry Vehicles (RVs), weapon delivery and launch systems, chemical and biological agents, Special Nuclear Material (SNM), and related nuclear weapons manufacturing equipment. The ATMS has potential applications in the areas of arms control, disarmament and Non-proliferation treaty verification, military asset control, as well as International Atomic Energy Agency (IAEA) and Euratom safeguards monitoring activities. The concept presented here is mainly focused on a monitoring technology for proliferation sensitive items. It should, however, be noted that the systems potential applications are numerous and broad in scope, and could easily be applied to other types of monitoring activities as well.

23896 (UCRL-ID–112025) **An approach for using data supplied by the former Soviet Union to improve US treaty monitoring.** Buonpane, L.; Sicherman, A. Lawrence Livermore National Lab., CA (United States). Nov 1992. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012391. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Improvements in the Unites States' capability to monitor nuclear test ban treaties may be possible through judicious use of data supplied by the former Soviet Union. However, such data obtained through treaty mandated data exchanges or other means is of questionable validity. Thus, there are potential risks as well as benefits of incorporating such data into US monitoring techniques. In general, to make use of unverified data, we desire a quantitative approach that recognizes both the risks and the benefits. This paper presents a method for using data supplied by the former Soviet Union to improve nuclear test ban treaty verification. Specifically, we focus on Soviet-supplied test yields to refine the US estimate of a key parameter in the seismic magnitude-yield relationship used in verifying nuclear testing treaties (e.g., Threshold Test Ban Treaty, or TTBT). This paper provides background on the magnitude-yield equation and the potential risks and benefits of incorporating Soviet data. And it describes a classical statistics approach for dealing with Soviet data using a sequence of hypothesis tests. We present an innovative Bayesian approach having similarities to but key advantages over the classical statistics method. A numerical example is used to illustrate each step of the Bayesian approach. Then, we summarize key features of the Bayesian approach, including more flexibility in treating Soviet data while still minimizing the impact of potentially suspicious data on parameter estimates. Application of the approach to other verification contexts is also discussed. The appendices expand on technical details of the approach referred to in the paper.

36 MATERIALS

23897 (ANL/MSD/CP–76872) **Synthesis and properties of nanophase materials.** Siegel, R.W. Argonne National Lab., IL (United States). Materials Science Div. Mar 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921121–2: 3. joint conference of European East-West conference on materials and processes and European Materials Research Society fall meeting, Strasbourg (France), 3-6 Nov 1992). Order Number DE93011757. Source: OSTI; NTIS; GPO Dep.

Nanophase materials, with their grain sizes or phase dimensions in the nanometer size regime, are now being produced by a wide variety of synthesis and processing methods. The interest in these new ultrafine-grained materials results primarily from the special nature of their various physical, chemical, and mechanical properties and the possibilities to control these properties during the synthesis and subsequent processing procedures. Since it is now becoming increasingly apparent that their properties can be engineered effectively during synthesis and processing, and that they can also be produced in quantity, nanophase materials should have considerable potential for technological development in a variety of applications. Some of the recent research on nanophase materials related to their synthesis and properties is briefly reviewed and the future potential of these new materials is considered.

23898 (CONF-9209221–, pp. 1-41) **Positron spectroscopy for the study of materials.** Mills, A.P. Jr. (AT & T Bell Labs., Murray Hill, NJ (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The relation of the positron method to the neutron and x-ray techniques is considered, and the prospects for materials studies with intense positron sources are assessed. The goal of the deductive branch of experimental condensed matter and materials science is to know the states of a substance and thus to understand how to make beneficial modifications and applications. The probes used range from feebly interacting microscopes and diffractometers to strongly perturbative impurities; from susceptibility measurements in weak applied fields to the layer-by layer or sometimes total destruction of a sample. Compared to neutrons and X-ray photons, positrons being charged tend to interact rather strongly with a sample. Because of the greater amount of theory sometimes needed for interpretation and because of the small source intensities, positron experiments have often been neglected in favor of other methods. Part of such a prejucice is justifiable from the point of view of a materials scientist since often one is learning more about the system consisting of one positron plus a material than about the material itself. While experiments aimed at studying an impurity may be of fundamental or academic interest and could lead to future practical results, on should heed the famous question of Phil Platzman, "What are you doing that for?"

23899 (CONF-9209221–, pp. 69-89) **Present and future status of positrons in industrial research.** Tanigawa, Shoichiro (Univ. of Tsukuba, Ibaraki (JP)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The author reviews the present and future status of positrons in industrial research in Japan. At present the government views positron research as basic research, not having immediate applied benefits, and in todays political climate is funding work on positron sources. There is a large demand for probes which can study lattice defects near surfaces or interfaces, coming from materials engineering people. Characterization of surfaces and interfaces is of great interest. The appearance of slow and/or monoenergetic positron sources has made it possible to study defects. This feature of slow positrons has attracted the interest of industrial people, especially those working with semiconductor based devices. Recent guidelines on "Advanced Use of Radiations" in the atomic energy fund has resulted in JAERI starting work on plans for a positron factory. The rapid deployment of small cyclotrons for positron sources as part of positron CT devices in the medical field has attracted the notice of engineers in fields such as automobile manufacturing, where such techniques may aid in performance studies of engines. A major interest is in seeing more efficient moderation processes developed so that one can use sources below the 100 μCi level, which in sealed sources are not legally radioactive in Japan. This will allow the much more rapid deployment of positron techniques in industrial settings.

23900 (CONF-9209221–, pp. 95-109) **The application of positron spectroscopy to materials sciences the perspective from the Idaho National Engineering Laboratory.** Denison, A.B. (Idaho National Engineering Lab., ID (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United

States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The demand for the development and processing of new types of sophisticated materials under a variety of uses and environments has placed a strain on the current technologies. This, coupled with a national effort (with DOE as a partner) to bring US industrial manufacturing technologies into a competitive posture internationally, requires the application of the best technical methods which can be developed. The unique behavior of the positron in materials makes it a valuable non-destructive probe of materials on a microscopic scale. Recent years have seen the development of positron beams and the positron microscope. Uses of such beams and the microscope have been shown to be sensitive probes of; defects in materials, surface studies valuable in many manufacturing and biological applications, thin film studies, metal aging and fatigue, and polymer and composite aging and fatigue. The microelectronics industry has indicated a definite interest in using highly resolved positron beams and microscopy for metal oxide defects, bonding integrity of circuit elements, and as a lithography tool in the mask making process. At INEL areas of interest include processing of vapor deposited metal coatings, and mechanically formed alloys which possess superior strength and reliability. Laboratory and experimental studies have shown the method of positron microscopy is limited by available intensity and resolution. An overall effort is needed to design and provide intense sources. The author argues for the role INEL could provide in developing such facilities. A beam facility has been designed capable of producing 10^{12} slow mono-energetic e^+/s at 5 keV over a 0.03cm diameter beam size. The beam is tailored to be accepted by a positron microscope. The design effort has been carried out in conjunction with the positron microscope research group at the U of Michigan.

23901 (CONF-9209221–, pp. 111-129) **The application of positron spectroscopy to materials science in China.** Wang, S.J. (Wuhan Univ. (CN)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The positron annihilation spectroscopy is widely used to investigate the material properties in China. The main fields are metals and alloys, semiconductors, polymers, high-$T_c$superconductors. The special attention is paid for some novel material with practical application. Chinese researchers measured the positron annihilation parameters of materials in various states and then correlated with the material properties.

23902 (CONF-9209221–, pp. 224-236) **Positron microscopy in materials sciences.** Gidley, D. (Univ. of Michigan, Ann Arbor (US)); Frieze, W.; DeMaggio, G.; Dull, T.; Yu, E. Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

In assessing how the fields in materials sciences can best employ existing and emerging positron methodologies the authors concentrate on microscopic techniques and applications. From a historical perspective this is logical. Before the advent of focussed beams of positrons, beta-decay sources with broad energy distribution were used in the 1960's and 70's to study the momentum and spatial distributions of electrons undergoing annihilation in bulk samples. Variable energy positron beams have allowed us in the 1980's to not only extend these techniques to surfaces, thin films, and interfaces (and the depth profiling thereof), but also to add new techniques such as reemitted positron and positronium spectroscopy, low energy positron diffraction, and positron-annihilation induced Auger spectroscopy. The addition of microscopic lateral resolution to all of the above techniques should be the next extension in beams for the 90's. The authors will briefly discuss the operational modes of a positron microscopy, dividing them into two basic types: the reemitted positron microscopy and the scanning microprobe. For reemission microscopy image contrast is determined by any target property that affects the probability, energy, or angle of positron reemission, e.g. trapping in surface and near surface defects, changes in material composition, and blocking by surface overlayers. In scanning mode contrast is determined by local structure that affects the particular positron signal employed; typically Doppler broadening or angular correlation of the annihilation gammas, fraction of reemitted positrons or positronium, or the positron lifetime spectrum.

23903 (CONF-9209221–, pp. 237-251) **Positron annihilation in materials science with a pulsed positron beam of variable energy.** Trifshaeuser, W. (Universitaet der Bundeswehr Muenchen, Neubiberg (DE)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Positrons are very sensitive probes for vacancy type defects of atomic dimensions, e.g. vacancies, vacancy agglomerates, voids, dislocations. It is well established that positrons can be trapped at these defects and because of the locally reduced electron density the lifetime of the positron localized at the defect increases. Since it is possible to determine up to four different lifetime spectrum, it is possible to separate out various atomic defect configurations and concentrations, which may be present simultaneously, with very high sensitivity (≈1 ppm) and in a nondestructive way. The conventional lifetime method with positrons from a radioactive isotope (positron energies up to about 600 keV) and hence ranges of the fast positrons of 50-1000 μm, can give only information for defect distributions of macroscopic regions or an average defect structure. Monoenergetic positrons of low and variable energy (1 keV to 30 keV), however, can sample near surface regions and layered structures in a much more detailed and also nondestructive manner. The principle and the set up of such a system as well as experimental results will be presented and discussed. With the present pulsed system (≈3 mm beam diameter) planar pure surfaces, coated and laser treated surfaces of metals, alloys and semiconductors have been or are being studied. With this depth profiling also interfaces of oxides and semiconductors can be investigated. The typical textures of technical alloys or the dimensions of functional units in microelectronic devices, however, are in the range of micrometers. Therefore for many applications in materials science a positron beam diameter in the micrometer range is desirable and necessary. This will lead to a scanning positron microscope consisting of a pulsed positron beam (~1 μm diameter) of variable energy (500 eV to 30 keV) with a scanning facility of the beam. A possible design of such a system will be presented and discussed.

23904 (CONF-9209221–, pp. 253-272) **Positron annihilation induced auger electron spectroscopy.** Weiss, A. (Univ. of Texas, Arlington (US)); Fazleev, N.; Kim, J.H.; Jensen, K.H.; Koymen, A.R.; Lee, K.H.; Tyan G., L.W.; Yang, Y.S.; Zhou, H.Q. Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Positron Annihilation Induced Auger Electron Spectroscopy (PAES) makes use of a new mechanism for the excitation of Auger transitions in which a beam of low energy positrons is used to create the necessary core-hole excitations by annihilating core electrons. This mechanism gives PAES a number of significant advantages over conventional methods of Auger spectroscopy. Because the incident positron beam energy need not be larger than the core level ionization energy, (as is the case in conventional Electron induced Auger Electron Spectroscopy (EAES)). PAES spectra can be obtained using very low (less than 30eV) incident beam energies. This makes is possible to eliminate the very large collisionally induced secondary electron background which plagues

EAES. In addition, the positron Auger signal originates almost exclusively from the topmost atomic layer due to the fact that the positrons annihilating with the core electrons are trapped in an image correlation well just outside the surface. In this talk, the results of experiments on clean and adsorbate covered surfaces are reported which demonstrate the extremely low background, and increased surface sensitivity that is possible with PAES. Next the authors will describe experiments in which PAES has been applied to the study of the growth, alloying and inter-diffusion of ultrathin layers of Pd and Au on Cu and Si substrates. They conclude with a discussion of future applications of PAES including studies of surface magnetism using Polarized Positron annihilation induced Auger Electron Spectroscopy (P-PAES) and the use of a time delayed signal to permit microprobe PAES analysis using kilovolt positron beams.

23905 (CONF-9209221–, pp. 273-290) **Present status of design study for the positron factory.** Okada, Sohei (Japan Atomic Energy Research Institute, Takasaki (JP)). The Japan Atomic Energy Research Institute, JAERI, has been promoting design studies for the "Positron Factory", in which linac-based intense monoenergetic positron beams are planned to be applied to advanced materials characterization and new fields of basic research. A tentative goal of the slow positron beam intensity is $10^{10}s^{-1}$. The design is based on a new target system, in which simultaneous multi-channel extraction of slow positron beams by multiple tungsten moderator assemblies is applied. This geometrical configuration will utilize excaping high-energy positrons from the first assembly again in the following ones. Slow positron reemission probabilities from the assemblies were evaluated using a Monte Carlo code named SPG (Slow Positron Generation) to simulate moderation, diffusion, annihilation and reemission of positrons. The conclusion was that energetic positrons ejected from the converter with energies less than 10 MeV are efficiently exploited for slow positron generation. Energies and angular distributions of energetic positrons from the tantalum converter were calculated for a wide range of incident electron energies (25 MeV to 2.5 GeV) and various converter thicknesses by using an electromagnetic cascade shower Monte Carlo code EGS4. The production efficiency of energetic positrons with energy less than 10 MeV and an ejection angle less than 20°, which are useful for generating slow positrons, was maximum at an electron energy of roughly 100 MeV. The conclusion is that the tentative goal of slow positron beam intensity may be attained, at least in the first moderator assembly. Actual slow positron yields in the rear assemblies will be less due to positron beam divergences, even if pulsed coil magnets are applied for focusing.

23906 (CONF-9209221–, pp. 291-316) **Positron annihilation in novel materials.** Jean, Y.C. (Univ. of Missouri, Kansas City (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

In the past years, the University of Missouri, Kansas City has applied positron annihilation spectroscopy to study electronic properties and defect structures in various types of novel materials: high $T_c$superconductors, C_{60}-based superconductors, organics, and polymers. The ultimate goal of this research is to provide clues for the search for novel materials, which have technological significance and industrial applications. Research strategies are: (1) to prepare materials of the highest possible quality including complete physical and chemical characterizations of materials properties, (2) to perform positron experiments systematically, (3) to perform theoretical calculations for a thorough understanding of the obtained experimental results.

23907 (CONF-9209221–, pp. 355-363) **Theoretical aspects of positron annihilation in condensed matter.** Pickett, W.E. (Naval Research Lab., Washington, DC (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. The annihilation of positrons with electrons in condensed matter provides a unique probe of solids. As a probe of the bulk material, it is insensitive to surface difficulties but is sensitive to structural inhomogeneties. Measurement of the two dimensional angular correlation of annihilation radiation (2D-ACAR) gives spectra containing detailed information about the electronic wavefunctions, and therefore the bonding of atoms in the solid. The standard way to interpret these electron-positron momentum densities is via comparison with local density band structure calculations. Sharp breaks in the momentum distribution reflect Fermi surfaces in metals, which are essential to know. Important questions about the techniques include: can experimental resolution be improved to allow the identification of the Fermi liquid renormalization factor Z^*? Can the method be used to identify the change in momentum distribution arising from the opening of the gap in the superconducting state (high temperature superconductors are encouraging in this regard)? Should there be more emphasis on identifying and interpreting the reciprocal form factor? These items will be addressed keeping in mind current capabilities and short-term possibilities.

23908 (CONF-9209221–, pp. 365-371) **[Application of positron annihilation spectroscopy].** Feldman, L. (AT & T Bell Labs, Murray Hill, NJ (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The author discusses an application of positron annihilation spectroscopy. Point defects in Si are determined to be less than $5 \times 10^{15}cm^{-3}$. Defect concentrations are of interest in Si MOSFET devices due to enhanced leakage currents. The author then comments on issues which conferees should consider in the process of developing positron spectroscopy into a materials science diagnostic. They include: compare results with other competing technologies; focus on measurements which the technique performs best; measure material properties. Measurements suggested include; band structure, interfaces; defect profiling near surfaces; precursors to macroscopic failure; band structure near defects; laminations and adhesion of metal/polymers, or metal/semiconductors; non-contact measurement of electrically active defects.

23909 (CONF-9209221–, pp. 373-376) **Potential applications of PAS techniques to industrial research in polymeric materials.** Yang, H. (Imaging Research Labs., Rochester, NY (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The author discusses different material science applications where positron annihilation spectroscopy can be applied to solve materials problems. These include the following topics. Study of photoconductors through examination of glass transitions, dipole moment measurements, measurement of free volume vs. mobility, and surface crystallization, defects, and crazing. Study of free volume changes in polymer blends as a function of mixing. Aging behaviour of materials; toughness transitioning to brittleness as a function of free volume. Study of failure in materials, looking at defect development from crazing to cracks to final failure. Properties of semicrystalline polymers. Study of surface and interface properties by examination of surface roughness, crazing, and defects.

This can also include measurement of interface thickness and adhesion. Study of crosslinked polymers by looking at free volume in relation to the microstructure and degree of inhomogeneties.

23910 (DOE/FTR–93012986) **[Travel to United Kingdom to attend and present a paper at the first European conference on smart structures and materials]: Foreign trip report, May 10–20, 1992.** Segalman, D.J. Sandia National Labs., Albuquerque, NM (United States). 10 Jun 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012986. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The paper presented by the author, "Simulation of the Dynamic Behavior of Polymeric Gels" (bending of polyelectrolyte gels), was well received. The visit to De Rossi's laboratory revealed that he has performed many of the same experiments that the author has planned with polyacrylonitrile fibers; collaboration is possible. Primary focus of the papers at the conference was on application of old smart materials (fiber optics, piezoelectrics, aerospace, optics, sensors, actuators, controllers). (DLC)

23911 (ORNL/FMP–93/3) **Publications of the Fossil Energy Advanced Research and Technology Development Materials Program, April 1, 1991–March 31, 1993.** Carlson, P.T. (comp.). Oak Ridge National Lab., TN (United States). [1993]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013097. Source: OSTI; NTIS; GPO Dep.

Objective of DOE's Fossil Energy Advanced Research and Technology Development Materials Program is to conduct research and development on materials for fossil energy applications, with focus on longer-term needs. The Program includes research aimed at a better understanding of materials behavior in fossil energy environments and on the development of new materials capable of substantial improvement in plant operations and reliability. Scope of the program addresses materials requirements for all fossil energy systems, including materials for coal preparation, coal liquefaction, coal gasification, heat engines and heat recovery, combustion systems, and fuel cells. Work on the Program is conducted at national and government laboratories, universities, and industrial research facilities. Research conducted on the Program is divided among the following areas: (1) ceramics, (2) new alloys, (3) corrosion research, and (4) program development and technology transfer. This bibliography covers the period of April 1, 1992, through March 31, 1993, and is a supplement to previous bibliographies in this series. The publications listed are limited to topical reports, open literature publications in refereed journals, full-length papers in published proceedings of conferences, full-length papers in unrefereed journals, and books and book articles.

23912 (ORNL/FTR–4165) **[Travel to Japan for the international symposium on ultra-high temperature materials]: Foreign trip report, November 30–December 9, 1991.** Huddleston, R.L. Oak Ridge National Lab., TN (United States). 23 Dec 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011056. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the "International Symposium on Ultra-High Temperature Materials" in Tajimi City, Japan, as one of three invited guest lecturers. The Symposium focused on materials technologies forapplications above 2000°C, with emphasis on aerospace (space plane, supersonic and hypersonic technologies, and rocket technology), energy (fusion reactor and supercritical thermal plants), and high-temperature material characterization. An independent visit was made to the Power Reactor and Nuclear Fuel Development Corporation (PNC), Oarai Engineering Center, Oarai, Japan, to discuss high-temperature structural design technology for liquid metal reactors and to tour the structural test capabilities in the Structural Engineering Section.

23913 (ORNL/M–2788) **ABSTRACTS: Seventh annual conference on fossil energy materials.** Oak Ridge National Lab., TN (United States). 1993. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-9305135–Absts.: 7. annual conference on fossil energy materials, Oak Ridge, TN (United States), 11-13 May 1993). Order Number DE93014013. Source: OSTI; NTIS; GPO Dep.

Objective of the Advanced Research and Technology Development materials program is to conduct R and D on materials for fossil energy applications (coal processing, coal liquefaction, gasification, heat engines and recovery, combustion systems, fuel cells). Research is aimed at better understanding of materials in fossil energy environments and development of new materials for improvement of plant operations and reliability. Abstracts are given of 37 papers on ceramics/composites, intermetallics (iron aluminides, etc.), and advanced austenitics. (DLC)

23914 (ANL/MCT/CP–79046) **Corrosion performance of iron aluminides.** Natesan, K. Argonne National Lab., IL (United States). Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305135–1: 7. annual conference on fossil energy materials, Oak Ridge, TN (United States), 11-13 May 1993). Order Number DE93011768. Source: OSTI; NTIS; GPO Dep.

Iron aluminides are being developed for use as structural materials and/or cladding alloys in fossil energy systems. Extensive development has been in progress on Fe_3Al-based alloys to improve the engineering ductility of these alloys. This paper describes results from the ongoing program to evaluate the corrosion performance of these alloys. The experimental program at Argonne National Laboratory involvesthermogravimetric analyses of alloys exposed to environments that simulate coal gasification and fluidized-bed combustion. Experiments were conducted at 650–1000°C in simulated oxygen/sulfur gas mixtures. In addition, oxidation/sulfidation behavior of several alumina-forming Fe-Al and Fe-Cr-Ni-Al alloys was determined for comparison with the corrosion rates obtained on iron aluminides. Other aspects of the program are corrosion evaluation of the aluminides in the presence of HC1-containing gases and in the presence of slag from a slogging gasifier. Results are used to establish threshold Al levels in the alloys for development of protective alumina scales. Thermal cycling tests are used to examine the spalling resistance of the scales.

23915 (ANL/MSD/CP–79532) **On the hardening and softening of nanocrystalline materials.** Fougere, G.E. (Northwestern Univ., Evanston, IL (United States). Dept. of Materials Science and Engineering); Weertman, J.R.; Siegel, R.W. Argonne National Lab., IL (United States). Materials Science Div. Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ;FG02-86ER45229. (CONF-920947–5: Conference on nanostructured materials, Cancun (Mexico), 21-25 Sep 1992). Order Number DE93012901. Source: OSTI; NTIS; GPO Dep.

Nanocrystalline Pd and Cu samples have been thermally treated to determine whether the relation between hardness and grain size depend on the method used to vary the grain sizes. Previous reports indicate that hardening with decreasing grain size resulted from data obtained using individual samples, while softening with decreasing grain size resulted from data from a given sample that had been thermally treated. Hardening and softening regimes were evident for the nanocrystalline cu, and the hardness improvements over the original as-consolidated state were maintained throughout the thermal treatments. This review examines our hardness results for Cu and Pd and those for other nanocrystalline materials.

23916 (CONF-8905118–14) **Transport phenomena in welds with emphasis on free surface phenomena.** Szekely, J. Massachusetts Inst. of Tech.,-Cambridge, MA (United States). Dept. of Materials Science and Engineering. [1989]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER45289 ;FC05-85ER25000. From 2. international conference

on trends in welding research; Gatlinburg, TN (United States); 15-19 May 1989. Order Number DE93013436. Source: OSTI; NTIS; GPO Dep.

Purpose of this article is to address the free surface behavior of welding arc systems: The welding arc may be affected by weldpool shape, the interaction of plasma gas stream with weldpool may use surface instabilities, and collapse of deformed weldpool may produce weld defects. A brief review is given of the mathematical modeling of arc welding operations. While the discussion has focused on arc welding, the free surface problem may be of even greater importance in electron beam and laser welding. 39 refs., 13 figs.

23917 (CONF-9206173–11) **Understanding heat and fluid flow in linear GTA welds.** Zacharia, T.; David, S.A.; Vitek, J.M. Oak Ridge National Lab., TN (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 3. international conference on trends in welding research; Gatlinburg, TN (United States); 1-5 Jun 1992. Order Number DE93012958. Source: OSTI; NTIS; GPO Dep.

A transient heat flow and fluid flow model was used to predict the development of gas tungsten arc (GTA) weld pools in 1.5 mm thick AISI 304 SS. The welding parameters were chosen so as to correspond to an earlier experimental study which produced high-resolution surface temperature maps. The motivation of the present study was to verify the predictive capability of the computational model. Comparison of the numerical predictions and experimental observations indicate good agreement.

23918 (CONF-9209221–, pp. 197-221) **High flux positron beams for positron reemission microscopy and positron annihilation microprobe defect studies.** Canter, K.F. (Brandeis Univ., Waltham, MA (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Monovacancies play a fundamental role in the onset of damage in metals and in several other mechanical properties of materials. Of particular importance is the spatial distribution and subsequent motion of monovacancies, and the associated aggregation of the monovacancies into macroscopic defects. The recently developed positron reemission microscopy (PRM) has the potential for imaging the spatial distribution of monovacancies that are near the surface of negative positron work function metals. Such imaging is not possible with electron microscopes. A PRM image reveals subsurface and overlying structures that impede the reemission of positrons implanted into a sample. Since thermal and near-thermal positrons are readily trapped by monovacancies, a monovacancy at 1nm below the surface would produce a fuzzy spot with more than 50% contrast when viewed with a 1nm diffraction limited PRM at 50,000X magnification, for example. The contrast would decrease in a nearly linear fashion as the distance between the monovacancy and the surface would produce a fuzzy spot with more than 50% contrast when viewed with a 1nm diffraction limited PRM at 50,000X magnification, for example. The contrast would decrease in a nearly linear fashion as the distance between the monovacancy and the surface increases, with an estimated viewing depth ranging to roughly 10 nm below the surface. In order to achieve 1nm resolution, $10^{17}e^{+}/cm^{2}$ incident flux density on the sample is required, assuming a 10% reemission efficiency of the foil. This translates to $10^{10}e^{+}$ focussed into a 3 micron diameter spot, the smallest beam spot presently achievable. Taking into account the 90% loss in primary beam flux resulting from the brightness enhancement needed to obtain a 3 micron beam at 5 keV, one would thus need the equivalent of $10^{11}e^{+}$ emitted from a 10 mm diameter moderator with a transverse energy of 0.2eV or better for each PRM exposure.

23919 (CONF-921275–, pp. 49-52) **Discussions on a method to evaluate corrosion hazards in ocean vessel structures from formic acid, acetic acid, and propionic acid.** Kuraya, E. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Asakura, S.; Yano, C.; Asami, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Subsequent to the previous report which proposed a classifying chart to evaluate systematically corrosion hazards in chemicals corroding ocean vessel structural materials, the present paper determines corrosion hazards of formic acid, acetic acid, and propionic acid according to the chart, and discusses the reasonability of this evaluation method from results thereof. Test pieces (3×5×0.3 cm) were made from an SS 41 material, and the above three kinds of chemicals were used as the inspection chemical. A full immersion test was carried out on all of the test pieces immersed in the chemicals at 25°C for one to eight days to derive a corrosion loss (mm/y). A semi-immersion test was performed on the test pieces with half of each test piece surface immersed in the chemicals for seven days to derive the same parameter. The latter test is more stringent than the full immersion test because of additional effects of oxygen in atmosphere and chemical vapors. A flow chart determination according to the results of both tests classified all of the chemicals in the category No. 1 in the corrosion hazardous chemicals. The applicability of the classification chart was verified. 1 ref., 2 figs., 3 tabs.

23920 (CONF-921275–, pp. 53-56) **Discussions on a method to evaluate corrosion hazards in ocean vessel structures from sulfuric acid, nitric acid, and phosphoric acid.** Yano, C. (Shibaura Institute of Technology, Tokyo (Japan)); Asami, Y.; Kuraya, E.; Asakura, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Subsequent to the previous report which proposed a classifying chart to evaluate systematically corrosion hazards in chemicals corroding ocean vessel structural materials, the present paper determines corrosion hazards of sulfuric acid, nitric acid, and phosphoric acid according to the chart, and discusses the reasonability of this evaluation method from results thereof. Using test pieces made from an SS 41 material, a full immersion test, a semi-immersion test both using the above three kinds of chemicals, and a test with the chemicals added with water or sea water at 10% by weight assuming its mixing during ocean transportation were carried out. Further, considering a problem that may occur when corrosion rate increases with time, a YE test was also performed to measure polarization conductance (Y) and corrosion potential (E). When the results of these tests are classified according to the chart, phosphorous acid was determined as falling under the category No. 1 in the corrosion hazardous chemicals (with serious corrosion hazards as in undiluted solution), sulfuric acid as falling under the category No. 3 (seriously hazardous when mixed with water), and nitric acid as falling under the category No. 4 (seriously hazardous when mixed with sea water). The evaluation method was verified useful at the same time. 2 refs., 6 figs., 4 tabs.

23921 (CONF-921275–, pp. 79-80) **Surface modification on zirconium and its reactivity.** Shibasaki, A. (Kyushu Institute of Technology, Kitakyushu (Japan). Faculty of Engineering); Hara, Y.; Nakamura, H. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

While zirconium (Zr) is used as an igniting agent for different kinds of explosive materials, it has a danger of igniting and exploding with a little friction or static electricity. Accordingly, a discussion was given on a surface preparation to suppress its shock sensitivity. The test materials were Zr and its equivalent mixture with an oxidizer (potassium perchlorate). Three types of test specimens were used for the surface preparation: Zr immersed in fluoro resin or epoxy resin solution to form films (specimen A); Zr oxidized in a 170°C oxygen flow to form oxide films (specimen B); and Zr stirred in hydrogen fluorides with various concentrations, filtered and dried (specimen C). The result of a friction and electrostatic sensitivity test revealed that a test specimen with 10% HF treated for 10 minutes among the test specimens C caused almost no ignition in

both sensitivities, and was most effective. A thermal reactivity test using a differential thermal analysis clarified that the peak positions of heat generation shifted to a higher temperature side in any of the test specimens and that the 3%-HF treated specimen in the Test specimens C showed no whatever reaction. 3 figs., 2 tabs.

23922 (CONF-921275–, pp. 139-142) **Studies on use conditions for steel containers for high-concentration alkaline aqueous solution.** Fukunaga, K. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Yoshikawa, M.; Miyata, Y.; Asakura, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Discussions were given on use conditions for steel containers for high-concentration alkaline aqueous solution. Test pieces were made from a general structural rolled steel material, and NaOH aqueous solution was used as a test sample solution. The steel continued actively dissolving under a temperature of 25°C and the atmosphere and with the solution concentration of 10.5 mol (boundary concentration) or higher. With the concentration lower than this, the steel turned passive. The corrosion rate (Ip) after having turned passive was discussed using the average corrosion rate (Ip) from weight losses, and the polarization conductance (Y_{corr}) The (Ip) and the Y_{corr} showed constant values regardless of the alkaline concentration, and the Ip increased logarithmically with rising temperature without depending on the concentration. The active dissolution rate showed a constant value at below the boundary concentration (60°C, 12.5 mol) without depending on the concentration, and increased logarithmically with rising temperature. Passivation of the steel at below the boundary concentration suppressed the corrosion rate to about 1/20 of that at active dissolution. The container use conditions call for passivating the steel at below the boundary concentration, setting 80°C as the upper use limit, and placing the steel in an inert atmosphere during active dissolution. 2 refs., 7 figs., 1 tab.

23923 (CONF-921275–, pp. 143-146) **Passivation of steel in high-speed neutral water. 2.** Yoshikawa, M. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Chimi, K.; Miyata, Y.; Asakura, S.; Haruki, Y.; Odagiri, A. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

This paper reports the result of investigation on effects of flow velocity on corrosion of steel in neutral water in ranges from weak acidity to weak alkalinity. Corrosion of steel in tap water at low flow velocities from 0 m/s to 2 m/s is accelerated with increasing flow velocity, suppressed sharply at medium flow velocities from 2 m/s to 4 m/s, and remained constant at a high flow velocity of 4 m/s or higher. Average corrosion rate in weakly acidic buffer solution is higher than in other cases, and increased with increasing flow velocity. Corrosion in weakly alkaline buffer solution is somewhat accelerated in a high flow velocity region, but showed a constant average corrosion rate with small variation on the whole. Corrosion in neutral buffer solution is suppressed in the vicinity of zero flow velocity, but was accelerated when the flow velocity increased. From a test on corrosion in neutral phosphoric acid based buffer solution and tap water, and from anodic protection test, it was found possible that corrosion suppressing effect in a high flow velocity region in the tap water may emerge not simply from a passivation factor, but also from actions combined with other factors. Anodic protection on steel is effective in the buffer solutions, but not at all in the tap water. 1 ref., 5 figs., 3 tabs.

23924 (CONF-9306130–3) **On the gas dynamics of HVOF thermal sprays.** Hackett, C.M.; Settles, G.S.; Miller, J.D. Pennsylvania State Univ., University Park, PA (United States). Gas Dynamics Lab. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14302. From National thermal spray conference; Anaheim, CA (United States); 7-11 Jun 1993. Order Number DE93013803. Source: OSTI; NTIS; GPO Dep.

An experimental study has been performed on the gas dynamic aspects of the HVOF thermal spray process. A commercially-available HVOF gun (Hobart Tafa JP-5000) is used in this study. Optical diagnostic techniques including microsecond-exposure schlieren and shadowgraph imaging are applied to visualize the hot supersonic jet produced by this equipment without any particle injection. Rapid turbulent mixing of the jet with the surrounding atmosphere is observed, which is an issue of concern in coating quality because of the possibility of oxidation of the sprayed particles. This mixing appears principally to be a function of the density ratio between the hot jet and the cold atmosphere, rather than depending upon the combustion-chamber pressure or barrel length. The supersonic core of the HVOF jet dissipates rapidly due to the, mixing, so that the jet is no longer supersonic when it impinges upon the target surface being sprayed. Secondary issues also observed in this study include strong jet-noise radiation from the HVOF plume and the entrainment and induced bulk motion of the surrounding air. All these issues have a background in the field of gas dynamics which has not been previously applied to thermal spray technology.

23925 (CONF-930702–14) **Fatigue design curves for 6061-T6 aluminum.** Yahr, G.T. Oak Ridge National Lab., TN (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Pressure vessel and piping conference; Denver, CO (United States); 25-29 Jul 1993. Order Number DE93011849. Source: OSTI; NTIS; GPO Dep.

A request has been made to the ASME Boiler and Pressure Vessel Committee that 6061-T6 aluminum be approved for use in the construction of Class 1 welded nuclear vessels so it can be used for the pressure vessel of the Advanced Neutron Source research reactor. Fatigue design curves with and without mean stress effects have been proposed. A knock-down factor of two is applied to the design curve for evaluation of welds. The basis of the curves is explained. The fatigue design curves are compared to fatigue data from base metal and weldments.

23926 (DOE/CE/15492–T4) **Production of reactive sintered nickel aluminide: Fifth quarterly technical progress report, February 22, 1993–May 22, 1993.** Cooper, R.M. Xform, Inc., Cohoes, NY (United States). 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-91CE15492. Order Number DE93014434. Source: OSTI; NTIS; GPO Dep.

Effort over the past 3 months was directed at increasing manufacturing capacity (ball milling) and improving product quality. Orders for the powder have increased, mainly for plasma spray powders. NiAl is an excellent coat between a metal and a ceramic, and its use instead of cobalt should extending operating range for carbide tools. The feather phase in the sintered Ni_3Al was identified to be a Ni-rich phase nucleated on the grain boundaries with 10 wt % Al composition. The ductile to brittle temperature of powder extruded NiAl was found to be between 500 and 600 C, and shows a 50% elongation at 600 C.

23927 (DOE/ER/40643–2) **High field superconductor development and understanding: A. Establishing the limits of performance of niobium titanium; B. Establishing whether Chevrel Phase materials can become useful high field superconductors: Progress report, June 1, 1992–May 31, 1993.** Lee, P.J.; Jablonski, P.D.; Cooley, L.D.; Stejic, G.; Bonney, L.A.; Willis, T.C.; Larbalestier, D.C. Wisconsin Univ., Madison, WI (United States). Applied Superconductivity Center. 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40643. Order Number DE93013980. Source: OSTI; NTIS; INIS; GPO Dep.

The acquisition of a hydrostatic extrusion press now allows us to extrude composites under controlled conditions and enables us to fabricate new composite designs. We have successfully extruded a variety of composites including powder metallurgy APCs. Our conventional APC composite has been successfully brought to the completion of its fabrication. The results of the characterization of that composite have proven to be quite exciting. There is proof that the "ideal" microstructures that are hoped for in APC composites can be made. The flux pinning force of our APC composite is stronger than that for a conventional composite, despite having about half of the volume fraction of pins and a lower B_{c2} than occurs in a conventional composite. Additionally, the uniform nature of the microstructure makes our APC composite well-suited for

more fundamental studies of flux pinning. We have fabricated thin film "model" conductors in order to understand basic flux-pinning mechanisms and these films have yielded interesting data on the importance of film geometry. Further advances have been made in increasing the J_c of Chevrel Phase conductors and a clear path is now outlined for further improvement.

23928 (DOE/ER/45401–4) **Measurements of crystal growth kinetics at extreme deviations from equilibrium: Technical progress report, 1 September 1992–31 August 1993.** Aziz, M.J. Harvard Univ., Cambridge, MA (United States). Div. of Applied Sciences. 7 May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER45401. Order Number DE93014526. Source: OSTI; NTIS; GPO Dep.

We have measured solute trapping of Sn in Al over a wide enough range of velocities to make a quantitative test of theory. The Continuous Growth Model of Aziz is the only one-parameter model that fits the data. We have also measured the diffusive speed - the growth rate at which interfacial partitioning is in mid-transition between equilibrium partitioning and complete solute trapping - for several solutes in A1. We have found an inverse correlation between the equilibrium partition coefficient and the diffusive speed. Taken together, these results give us heretofore unprecedented predictive capability in modeling rapid solidification processing. We have also examined theoretically short-range diffusion-limited growth, characteristic of incomplete solute trapping, and interface-limited growth, characteristic of complete solute trapping, in alloy solidification and have shown that the two regimes fall naturally out of a single unified theory of solidification.

23929 (DOE/ER/45403–4) **Atomic structures and compositions of internal interfaces: Progress report, September 1, 1992–August 31, 1993.** Seidman, D.N. (Northwestern Univ., Evanston, IL (United States). Dept. of Materials Science and Engineering); Merkle, K.L. Northwestern Univ., Evanston, IL (United States). Dept. of Materials Science and Engineering; Argonne National Lab., IL (United States). 10 May 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER45403. Order Number DE93014840. Source: OSTI; NTIS; GPO Dep.

This research program addresses fundamental questions concerning the relations between atomic structures and compositions of homophase and heterophase interfaces. Metal/ceramic heterophase interfaces are created via the process of internal oxidation of metallic alloys. The interfaces are studied via a combination of conventional transmission electron microscopy, high resolution electron microscopy, field-ion microscopy and atom probe microscopy. The latter technique is employed to chemically sequence the interfacial region, and to show that the terminating (222) plane of MgO and CdO consists solely of oxygen atoms forthe Cu/MgO (111) and Ag/CdO (111) heterophase interfaces, respectively; this is achieved with no deconvolution of the experimental data. The evolution of metal/ceramic heterophase interfaces is studied by following the process of internal oxidation on an atomic scale from its very earliest stages. It is demonstrated that during the early stages of internal oxidation that metal atom clusters as well as hypo and hyperstoichiometric metal-oxygen clusters are present. Solute-atom segregation to grain boundaries is studied in binary metal alloys employing the free energy simulations and the overlapping distribution Monte Carlo methodologies for dilute Pt(Au), Cu(Ni) and Pd(Ni) alloys for both twist and tilt boundaries.

23930 (DOE/ER/54134–2) **Repair welding of fusion reactor components: Second year technical report.** Chin, B.A. Auburn Univ., AL (United States). Dept. of Mechanical Engineering. 15 May 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER54134. Order Number DE93015073. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments have shown that irradiated Type 316 stainless steel is susceptible to heat-affected-zone (HAZ) cracking upon cooling when welded using the gas tungsten arc (GTA) process under lateral constraint. The cracking has been hypothesized to be caused by stress-assisted helium bubble growth and rupture at grain boundaries. This study utilized an experimental welding setup which enabled different compressive stresses to be applied to the plates during welding. Autogenous GTA welds were produced in Type 316 stainless steel doped with 256 appm helium. The application of a compressive stress, 55 MPa, during welding suppressed the previously observed catastrophic cracking. Detailed examinations conducted after welding showed a dramatic change in helium bubble morphology. Grain boundary bubble growth along directions parallel to the weld was suppressed. Results suggest that stress-modified welding techniques may be used to suppress or eliminate helium-induced cracking during joining of irradiated materials.

23931 (DOE/FTR–93010924) **Welding technologies as applied to nuclear manufacturing: Foreign trip report, September 25–October 8, 1992.** Roper, J.R. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 23 Oct 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE93010924. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is the trip report of John R. Roper, who traveled to England September 25 through October 8, 1992. Dr. Roper attended the US/UK JOWOG 22-D Joining Technical Exchange meeting and gave a presentation on welding Finite Element Analysis and the Precision Joining Center at the Atomic Weapons Establishment in Aldermaston, United Kingdom. Dr. Roper also toured the Welding Institute in Abington, UK and discussed technology exchange of weld thermal and mechanical material responses.

23932 (DOE/FTR–93012551) **[Travel to Germany, France, and Sweden to obtain information about the underutilization of technologies by the US steel industry]: Foreign trip report, August 14–28, 1992.** DuBroff, W. USDOE Idaho Field Office, Idaho Falls, ID (United States). 28 Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012551. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The following were visited Aug. 14-28, 1992: MDH GMBH, Duesseldorf; PEAK Gmbh, Neviges; Boschgotthardschuette Gmbh, Siegen; University of Clausthal; IRSID (France); Verigen Deutscher Eisenhuettenleuter, Duesseldorf; Sandvik Steel AB; and MEFOS, Lulea, (Sweden). A lecture on Phase I of the Spray Forming Program was presented. There is a spray forming effort in Europe. The research effort in most processing areas exceeds that in USA by virtually all measures, reflecting industry's attitude that research is a necessity rather than an overhead. The laboratories are partially supported by the government. Implication is that U.S. industry will increasingly depend on foreign technology; this is further exacerbated by the fact that the heavy machinery industry in USA is nearly nonexistent. MDH is not impressed with direct steelmaking technology being investigated by AISI. The critical analysis that should have been commissioned is the relative merits of all of the competing processes (AISI, Corex, Dior, HiSmelt, etc.), because in the real world only one (or two at the most) will reach full-scale commercialization.

23933 (EGG-M–92696) **Performance aspects of de Laval spray-forming nozzles.** McHugh, K.M.; Key, J.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9306165—1: Multiphase flow problems in manufacturing and productive technology, Bethesda, MD (United States), Jun 1993). Order Number DE93013671. Source: OSTI; NTIS; GPO Dep.

Spray forming is a multiphase fabrication technology in which a spray of finely atomized liquid droplets is directed onto a suitably shaped substrate or pattern to produce a coherent, near-net-shape deposit The technology can simplify materials processing where simultaneously improving product quality. Researchers at the Idaho National Engineering Laboratory (INEL) are developing spray-forming technology for producing near-net-shape solids and coatings of a variety of metals, polymers, and composite materials using de Laval nozzles. Here we briefly describe the flow field characterization and atomization behavior of liquid metals in linear de Laval nozzles, and illustrate their versatility by summarizing results from three spray-forming programs. In one program, low-carbon steel strip >0.75 mm was produced. In another program, polymer membranes ~ 5 μm thick were spray formed. Finally, recent results in spray forming molds, dies, and related tooling for rapid prototyping are described.

23934 (EGG-M–92715) **Use of de Laval nozzles in spray forming.** McHugh, K.M.; Key, J.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9306130–2: National thermal spray conference, Anaheim, CA (United States), 7-11 Jun 1993). Order Number DE93010797. Source: OSTI; NTIS; GPO Dep.

Spray forming is a near-net-shape fabrication technology in which a spray of finely atomized liquid droplets is deposited onto a suitably-shaped substrate or pattern to produce a coherent solid. The technology offers unique opportunities for simplifying materials processing, oftentimes while substantially improving product quality. Spray forming is applicable to a wide range of metals and nonmetals, and offers property improvements resulting from rapid solidification (e.g. refined microstructures, extended solid solubilities, and reduced segregation). Economic benefits result from process simplification and the elimination of unit operations. Researchers at the Idaho National Engineering Laboratory (INEL) are developing spray-forming technology for producing near-net-shape solids and coatings of a variety of metals, polymers, and composite materials using de Laval nozzles. This paper briefly describes the atomization behavior of liquid metals in linear de Laval nozzles and illustrates the versatility of the process by summarizing results from two spray-forming programs. In one program, low-carbon steel strip > 0.75 mm thick was produced; in the other, polymer membranes ~5 μm thick were spray formed.

23935 (EGG-M–93104) **Bioextraction of cobalt from complex metal sulfides.** Thompson, D.L.; Noah, K.S.; Wichlacz, P.L.; Torma, A.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States); Department of the Interior, Washington, DC (United States). DOE Contract AC07-76ID01570. Contract J0134035. (CONF-930815–1: International biohydrometallurgy symposium, Jackson Hole, WY (United States), 22-25 Aug 1993). Order Number DE93013676. Source: OSTI; NTIS; GPO Dep.

The present study has investigated the bioleachability of naturally occurring cobaltite and synthetic cobalt sulfides using 29 pedigree and "wild type" strains of Thiobacillus ferrooxidans. On the basis of a screening test, five strains of bacteria were selected for assessing the effects of leach parameters (pH, ferrous and ferric sulfates, ammonium sulfate, bipotassium hydrogen phosphate, and substrate concentrations) on cobalt extraction from Blackbird Mine ore and concentrate. The mechanisms of cobalt extraction were explained in terms of direct and indirect modes of bacterial activity, and the chemistry involved in these processes was identified. Using various size fractions of a high-grade cobaltite, the kinetic parameters of cobalt extraction were derived for the effect of specific surface area to be V_m = 376 mg dm^{-3} h^{-1} and K 1.27 m^2 g^{-1}.

23936 (EGG-MS–10441) **Processing, properties, and wear resistance of aluminides.** Wright, R.N.; Rabin, B.H.; Wright, J.K. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1993. 42p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract AC07-76ID01570. Contract JO134035. Order Number DE93012186. Source: OSTI; NTIS; GPO Dep.

Fully dense alloys based on Fe_3Al were produced by reaction synthesis from low cost elemental powders using hot pressing, hot isostatic pressing or Ceracon process. The reaction proceeds by outward spreading of a transient liquid phase from the initial aluminum particle site and precipitation of the compound phase from the liquid. Combustion synthesized material has a very fine grain size that is resistant to coarsening at high temperature because of a high density of fine oxides from the prior particle boundaries. The fine grain size results in approximately twice the yield strength in the reaction synthesized material compared to hot extruded prealloyed powder. Combustion synthesis has also been successfully applied to joining Fe_3Al and to forming coatings on carbon steel substrates. Combustion synthesis has been shown to be viable for fabricating trialuminides from elemental powder compacts. Al_3Ti, $Al_{73}Ti_{24}Cr_3$ and $Al_{67}Ti_{25}Cr_8$ were examined. Fully dense, homogeneous materials exhibiting an equiaxed grain structure were produced by conducting reaction and homogenization under pressure, or in a furnace at ambient pressure and subsequently densifying the porous preform by hot consolidation. The tetragonal DO_{22} structure was the primary reaction product for all compositions. Most of the Cr remained undissolved after reaction and a homogenization heat treatment at 1200C or above was used to put the Cr into solution and form the desired $L1_2$ phase.

23937 (ETDE/JP-mf–93794512, pp. 430-436) **Production technology under high-temperature and corrosive environment.: Corrosion-resistant materials and sealing technology.** Nakamura, S.; Maekado, S.; Tezuka, N. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

With an objective to deal with production of petroleum and gases at great depths under high temperatures and pressures, developmental research works are under progress on corrosion-resistant production members and sealing technology for tubing joints. The works are being moved forward under a nine-year plan that started in 1985. This paper is an annual report of the results obtained during the fiscal 1993. Subsequent to the results obtained by the previous year from tests on test pieces made from carbon steel base material, given different surface preparations, short pipe coating samples were fabricated on a trial basis using a plasma chemical vapor deposition (PCVD) process, and corrosion tests were carried out in 1993. The PCVD process achieved multiple-layer coating (on Cr plated base metal) with different substances including Al2O3/TiN/TiC. As a result of an autoclave corrosion test using 5% NaCl solution, a prospect was obtained on structuring films with high possibility of assuring corrosion resistance. On the other hand, it was impossible to eliminate pitting without using an inhibitor even under a mild condition. Joint samples were also fabricated and evaluated, and erosion tests were performed. 2 figs., 3 tabs.

23938 (ETDE-mf–93792750) **Corrosion by carbonisation gas. Final report.** Auer, W.; Wasner, W. Erlangen-Nuernberg Univ., Erlangen (Germany). Lehrstuhl fuer Werkstoffwissenschaften 4. Jan 1992. 47p. (In German). Contract FE-KKs-Project E 4.1/9. Order Number DE93792750. Source: OSTI; NTIS (US Sales Only).

The high temperature corrosion of iron based materials in H_2-Ar-H_2S-HCl gas mixtures was examined. Conditions with low oxygen activity and high sulphur and chlorine activities were simulated, such as occur in coal gasification or carbonisation of refuse. The effect of HCl on sulphidation of iron-based materials can be explained by the following effects: For cracked, poorly adhering layers, HCl can lead by transport processes via gaseous chlorine in hollow spaces of the layer to increased speed of sulphidation. For linear kinetics of sulphidation, which is caused by outer phase boundary reactions determining the speed, adsorbed HCl can block part of the surfaces and therefore reduce the speed of sulphidation. With a parabolic time law of sulphidation, covering part of the surface can lead to an initial or continuous reduction of the sulphur activity at the surface and therefore to the parabolic scale constant. Investigations on technical alloys show that HCl has the same effect on low alloy steels as on iron. For high alloy steels, there is only a slight effect from the HCl initially, and there is no change of the amount of metal removed in experimental times up to 1000 hours. Traces of chloride in the layers can, however, lead to hole corrosion on sulphides and metal in quiet conditions in damp air. (orig./MM).

23939 (GKSS–92/E/16) **Constitution and deformation of $Fe_3(AlSi)$-based intermetallic phases.** Bosse, H. (GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Werkstofforschung). GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany); Technische Univ. Hamburg-Harburg, Hamburg (Germany). Arbeitsbereich Werkstoffphysik und -technologie. 1992. 291p. (In German). Order Number DE93792034. Source: OSTI; NTIS (US Sales Only).

The constitution of $Fe_3(AlSi)$-based alloys was examined by means of transmission electron microscopy and X-ray powder diffraction on quenched samples. Critical temperatures for DO_3-order as well as the ranges of the several miscibility gaps between the α solid solution and the ordered phase α' (B2 structure) and α'' (DO_3 structure) were determined in alloys with 80, 75 and 70 at%

iron. The critical temperatures were used to calculate the interaction and antiphase boundary energies within the framework of the Bragg-Williams approximation. The morphology of the two phase microstructures and the nucleation behaviour in the ordered alloys are discussed. Additionally the dislocation structures in $Fe_{70}Al_{30}$ single crystals deformed at different temperatures were investigated by electron microscopy and the results were compared to existing models to explain the temperature dependence of the yield strength. (orig.) With 130 figs., 17 tabs.

23940 (Juel–2681) **Deformation behaviour of thick walled tubes of X10NiCrAlTi 32 20 under cyclic thermomechanical loadings (ratcheting).** Schmidt-Plutka, A.; Breitbach, G.; Schubert, F.; Nickel, H. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Reaktorwerkstoffe; Technische Hochschule Aachen (Germany). Oct 1992. 97p. (In German). Order Number DE93792709. Source: OSTI; NTIS (US Sales Only).

Dissertation submitted by A. Schmidt-Plutka.

In heat exchanger components which are exposed to temperatures of more than 500deg C, creep deformations must be taken into account. In the context of start up and shut down procedures or hot flow streaks secondary stresses are induced in these components. If additionally load controlled stresses (primary stresses) are present, e.g. in a tube under internal pressure, enhanced strain rates may occur (so called creep ratcheting). But also without any load controlled stresses, a progressive reduction in the length of the tube can occur. The strong temperature dependence of creep is responsible for this effect. Creep ratcheting was evaluated in axially unloaded and loaded thickwalled tubes of INCOLOY 800 under cyclic inductive heating conditions. The test of tubes under cylic heating conditions showed a progressive axial contraction. In the case of cyclic thermal stresses with a superimposed primary stress, the creep rate increased up to a factor between 2 and 9 compared to the creep rate for the same primary stress under constant temperature conditions. Under constant temperature conditions the effect of negative creep due to microstructural instabilities could be observed. For the calculation of the temperature distributions in thickwalled tubes under cyclic heating conditions a computer program has been used based on finite differences method. By using this calculated temperature fields the creep strain behaviour was investigated with the FE-code ABAQUS. Here without any primary stress the FE-calculations showed a progressive axial contraction in good consistency with the experiments. In the case of cyclic secondary stresses with additional primary stresses the relationship between the calculated ratcheting strain rates were slighlty underestimated. Nevertheless the theoretical analysis fairly confirmed the experimental results. (orig.).

23941 (KCP–613-4940) **Characterization of the personal computer based computed tomography system: Final report.** Ekis, J.W. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Feb 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93008843. Source: OSTI; NTIS; GPO Dep.

The purpose of this project was to construct a personal computer based computed tomography (CT) system. The average industrial CT system ranges in price from $1,000,000 to $2,500,000. The entire PC based system at the Kansas City Division totaled around $300,000 to build. The system can detect flaws that are 0.010 inch in diameter. The resolution of the system is better than 0.020 inch. These measurements are valid for up to 3-inch-thick aluminum. In 1-inch- thick steel, the detectability is at least 0.020 inch and the resolution is better than 0.060 inch.

23942 (LA-UR–93-1670) **Micromechanical strength effects in shock compression of solids.** Johnson, J.N. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306167–4: Joint AIRAPT/APS meeting, Colorado Springs, CO (United States), 28 Jun - 3 jul 1993). Order Number DE93014425. Source: OSTI; NTIS; GPO Dep.

Time-resolved shock-wave measurements and post-shock recovery have long been used for inferring the underlaying micromechanics controlling high-rate deformation of solids; this requires considerable subjective interpretation. In spite of this, progress has been made in experimentation and theoretical interpretation of the shock-compression/release cycle and some of the results are reviewed here for weak shocks. This cycle involves the elements of the elastic precursor, plastic loading wave, pulse duration, release wave, and post-mortem examination. Those topics are examined, with emphasis on the second and fourth elements. Cu and Ta results show how shock data can be used to determine the transition from deformation mechanism of thermal activation to that of dislocation drag. Release-wave studies indicate that the leading observable release disturbance in fcc metals may not be propagating with the ideal longitudinal elastic-wave speed. 5 figs, 18 refs.

23943 (LBF-FB–196(1992)) **Improvement of corrosion fatigue behaviour of high-strength steel welds by means of optimized post weld treatments.** Mueller, F.; Sonsino, C.M.; Muesgen, B. Fraunhofer-Institut fuer Betriebsfestigkeit (LBF), Darmstadt (Germany). 1992. 69p. (In German). Order Number DE93792325. Source: OSTI; NTIS (US Sales Only).

In this research work the fatigue behaviour of welded V-shaped specimens made of the steels Fe E 355 KT and Fe E 690 V with two types of post weld treatment (TIG-dressing of the weld toe, shot peening of the weld toe) were examined. The specimens were submitted to random bending loading (variable amplitudes, spectrum loading with linear distribution of the amplitudes) under presence of a corrosive environment (artificial sea-water) unit final fracture occurred. When compared to the as-welded state, shot peening led to an increase of fatigue life by a factor of 3 to 10, depending on the material of the weld. TIG-dressing led to a factor of 13. The combination of both, TIG-dressing and subsequent shotpeening, led to an increase of fatigue life by a factor of 50 in the case of the Fe E 355 KT. On the other hand, if the influence of the corrosive environment on the TIG-dressed welds of Fe E 690 V was reduced by means of a cathodic protection, fatigue life could be improved by a factor of 100. The results of this research work show, that fatigue performance can be improved significantly, if the above mentioned post weld treatments are applied. It is now possible to apply the two steels with a higher efficiency, which will subsequently lead to a remarkable reduction of costs. (orig.) With 42 figs.

23944 (ORNL/FTR–4176) **[Development, processing, properties, and applications on advanced alloys, ceramics, polymers, and composites]: Foreign trip report, December 9–20, 1991.** George, E.P.; Bloom, E.E. Oak Ridge National Lab., TN (United States). 9 Jan 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011090. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The travelers attended and presented papers at the 2nd Japan International SAMPE Symposium including development, processing, properties, and applications on advanced alloys, ceramics, polymers, and composites. E.P. George visited several places studying intermetallic alloys. Much of the intermetallics research seems to be driven by MITI's national aerospace plant project for which TiAl and Nb_3Al are candidate materials. Work is also being done on Nb_3Al, Ni_3Al, FeAl, and NiTi. Processing research appears to be as important as research on deformation and fracture mechanisms, even at universities. The intermetallics field is growing, with Yamaguchi in charge of a new program recently started at universities, that will complement the MITI project. (DLC)

23945 (ORNL/FTR–4214) **Travel to Switzerland to attend the 1992 meeting of the International Cooperative Group on Irradiation-Assisted Stress Corrosion Cracking: Foreign trip report, March 9–14, 1993.** Bell, G.E.C. Oak Ridge National Lab., TN (United States). 27 Mar 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011107. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Presentations on "Spectral Effects on Radiation Damage Accumulation in Metals" and "Characterization of Radiation-Induced Segregation in the ICG-IASCC Round-Robin Materials Using Analytical Electron Microscopy and Scanning Auger Electron Microprobe Techniques" were given by the traveler at the 1992 meeting of the ICG-IASCC. During the two-and-one-half-day meeting, discussions of laboratory and fission reactor plant data, as well as

modelling of the mechanism(s) of IASCC, were inconclusive. The increasing data base suggests that there are at least two IASCC regimes. The first, at radiation doses less than 1 displacement per atom (dpa), is probably dominated by radiation-induced segregation (RIS) of solute atoms and an interaction of the material with the aqueous environment. The second is a higher dose regime, greater than 2 to 3 dpa, where the water environment may not be necessary to induce intergranular (IG) failure.

23946 (ORNL/FTR–4243) **[Travel to Japan for collaborative research on the high-temperature phase stability of austenitic stainless steels]: Foreign trip report, December 1, 1991–May 8, 1992.** Vitek, J.M. Oak Ridge National Lab., TN (United States). 18 May 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011094. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The phase stability of austenitic stainless steels was examined during the five-month assignment to the Steel Research Laboratories of Nippon Steel Corporation. This laboratory has excellent facilities, many of which are unavailable at ORNL, and the studies complemented ongoing work in the Basic Energy Sciences (BES) Welding Science Program at ORNL. Thermodynamic calculations were made for a variety of alloy compositions in an attempt to better explain earlier experimental results obtained at ORNL under rapid solidification, laser welding conditions. In addition, further laser welding experiments were carried out to determine the effect of the base material structure on the solidification behavior of stainless steels. While on assignment at the Steel Research Laboratories, several side trips were made to other facilities to learn about ongoing activities in other groups. Much of the work in Japanese universities is published exclusively in Japanese literature, and the opportunity to learn firsthand about these activities was very productive. It was found that several research groups are involved in research directly related to that in ORNL's BES Welding Science Program, and it is hoped that the contacts that were made can be maintained to allow for better future collaboration with the various research groups.

23947 (ORNL/FTR–4283) **[High-temperature corrosion and protection of materials]: Foreign trip report, May 23–June 4, 1992.** Tortorelli, P.F. Oak Ridge National Lab., TN (United States). 19 Jun 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011072. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Two papers were presented by P.F. Tortorelli at the Third International Symposium on High-Temperature Corrosion and Protection of Materials in Les Embiez, France. Substantial interest was shown in current ORNL research on iron aluminides, Cr-Nb alloys, and mechanical properties of oxide scales. At least two other organizations are actively pursuing applications for iron aluminides. A good mix of basic and applied research papers contributed to the value of the symposium. Dr. Tortorelli also visited Harwell Laboratory and Cranfield Institute of Technology in the United Kingdom (U.K.). At Harwell, he discussed experimental procedures for very-high-temperature oxidation and innovative methods of corrosion analysis. During his visit to Cranfield, he was briefed on the modeling of erosion and corrosion processes and had discussions related to the mechanical properties of oxide scales. Efforts in corrosion, erosion, and coatings at Cranfield are extensive and impressive.

23948 (ORNL/TM–12094) **Detection of radiation-induced changes in electrochemical properties of austenitic stainless steels using miniaturized specimens and the single-loop electrochemical potentiokinetic reactivation method.** Inazumi, T.; Bell, G.E.C.; Kenik, E.A.; Kiuchi, K. Oak Ridge National Lab., TN (United States). Jan 1993. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012865. Source: OSTI; NTIS; INIS; GPO Dep.

Single-loop electrochemical potentiokinetic reactivation testing of miniaturized (TEM) specimens can provide reliable data comparable to data obtained with larger specimens. Significant changes in electrochemical properties (increased reactivation current and Flade potential) were detected for PCA and type 316 stainless steels irradiated at 200–420°C up to 7–9 dpa. Irradiations in the FFTF Materials Open Test Assembly and in the Oak Ridge Research Reactor are reported on. 45 figs., 5 tabs., 52 refs.

23949 (PNL-SA–21491) **Radiation hardening and radiation-induced chromium depletion effects on intergranular stress corrosion cracking of austenitic stainless steels.** Bruemmer, S.M.; Simonen, E.P. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930318–9: NACE annual corrosion conference and materials performance and corrosion show, New Orleans, LA (United States), 7-12 Mar 1993). Order Number DE93011602. Source: OSTI; NTIS; GPO Dep.

Available data on neutron-irradiated materials have been analyzed and correlations developed between fluence, yield strength, grain boundary chromium concentration and cracking susceptibility in high-temperature water environments. Large heat-to-heat differences in critical fluence (0.2 to 2.5 n/cm^2) for IGSCC are documented.In many cases, this variability is consistent with yield strength differences among irradiated materials. IGSCC correlated better to yield strength than to fluence for most heats suggesting a possible role of the radiation-induced hardening (and microstructure) on cracking. However, isolatedheats reveal a wide range of yield strengths from 450 to 800 MPa necessary to promote IGSCC which cannot be understood by strength effects alone. Grain boundary Cr depletion explain differences in IGSCC susceptibility for irradiated stainless steels. Cr contents versus SCC shows that all materials showing IG cracking have some grain boundary depletion ($\geq$2%). Grain boundary Cr concentrations for cracking (below ~16 wt %) are in good agreement with similar SCC tests on unirradiated 304 SS with controlled depletion profiles. Heats that prompt variability in the yield strength correlation, are accounted for bydifferences in their interfacial Cr contents. Certain stainless steels are more resistant to cracking even though they have significant radiation-induced Cr depletion. It is proposed that Cr depletion is required for IASCC, but observed susceptibility is modified by other microchemical and microstructural components.

23950 (UCRL–101096) **Evaluation of austenitic alloys 304L and 316L and alloy 825 under tuff-repository conditions.** Kass, J. Lawrence Livermore National Lab., CA (United States). May 1989. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-8802159–2: Workshop on waste container corrosion, Winnipeg (Canada), 9-10 Feb 1988). Order Number DE93013840. Source: OSTI; NTIS; INIS; GPO Dep.

Primary concerns over use of types 304L and 316L are for chloride- induced stress-corrosion cracking (SCC) and weld microstructure stability. Possibly alloy 825 will be a more suitable candidate. (DLC)

23951 (UCRL-ID–111598) **Waste disposal of HYLIFE II structure: Issues and assessment.** Lee, J.D. Lawrence Livermore National Lab., CA (United States). 17 Nov 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93011711. Source: OSTI; NTIS; INIS; GPO Dep.

Initial analysis has shown that by using 304 stainless steel (SS) a significant fraction (92 wt%) of the structural mass in the initial HYLIFE-II design could be disposed of by shallow burial. And if all the structural components are mixed together and treated as one entity, all of it could be disposed of by shallow burial. Two other types of SSs assessed, Mn-modified 316 and Prime Candidate Alloy (PCA), were found to require disposal by deep geologic burial of most of the structural mass. The presents of Nb and Mo in Mn-modified 316 and Prime Candidate Alloy (PCA), were found to dominate the generation of long term wastes produced and their presence should be avoided.

23952 (UCRL-JC–108750) **Micro-finish hard anodized coatings on aluminum.** Steffani, C. Lawrence Livermore National Lab., CA (United States). Mar 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206129–5: 1992 American Electroplaters and Surface Finishers Society conference (AESF SUR/FIN 92), Atlanta, GA (United States), 22-25 Jun 1992). Order Number DE93012480. Source: OSTI; NTIS; GPO Dep.

The production of thin hard anodized coatings on Single Point Diamond Turned (SPDT) 6061-T6 aluminum has been studied. The investigation centered on producing a surface finish of less than 10

microinch after anodizing. By starting with a 2 microinch (AA) surface finish and controlling time, temperature, current density and solution chemistry, coatings with surface finishes of 8 microinch and a thickness of .0003 inch, are obtained. Surface roughness from several anodizing solutions is compared. The operational life of a PTFE sliding seal against a coated cylinder bore is used as verification of finish quality.

23953 (UCRL-JC–109229) **Self-consistent electronic-structure calculations for interface geometries.** Sowa, E.C. (Lawrence Livermore National Lab., CA (United States)); Gonis, A.; MacLaren, J.M.; Zhang, X.G. Lawrence Livermore National Lab., CA (United States). Dec 1991. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911202–88: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE93012496. Source: OSTI; NTIS; GPO Dep.

We describe a technique for computing self-consistent electronic structures and total energies of planar defects, such as interfaces, which are embedded in an otherwise perfect crystal. As in the Layer Korringa-Kohn-Rostol-er approach, the solid is treated as a set of coupled layers of atoms, using Bloch's theorem to take advantage of the two-dimensional periodicity of the individual layers. The layers are coupled using the techniques of the Real-Space Multiple-Scattering Theory, avoiding artificial slab or supercell boundary conditions. A total-energy calculation on a Cu crystal, which has been split apart at a (111) plane, is used to illustrate the method.

23954 (UCRL-JC–110996) **Machining aspects of nickel-phosphorus coatings.** Dini, J.W. Lawrence Livermore National Lab., CA (United States). Jul 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211117–7: Minerals, Metals, and Materials Society/American Society for Metals (TMS/ASM) materials week '92, Chicago, IL (United States), 2-5 Nov 1992). Order Number DE93013037. Source: OSTI; NTIS; GPO Dep.

Nickel-phosphorus coatings with greater than 10% phosphorus have been widely used for diamond turning applications such as fabrication of large optics and other high precision parts. This paper discusses the importance of phosphorus content of the alloy on wear of the diamond tool and provides some speculation on the role of phosphorus on machining characteristics.

23955 (UCRL-JC–111004) **Monte Carlo simulations of phase transformations in Fe-Cr alloys.** Reinhard, L.; Turchi, P.E.A. Lawrence Livermore National Lab., CA (United States). 1 Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921101–117: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93013847. Source: OSTI; NTIS; GPO Dep.

Phase stability properties of bcc based Fe-Cr alloys are examined in the framework of the-principles KKR-CPA-GPM formalism and Monte Carlo simulations. For Fe-rich alloys, ordered configurations are found stable with respect to the random state of the alloy, but unstable with respect to the pure Fe and Cr metals. Results are compared with the ones obtained by using energy parameters extracted from experimental diffuse scattering data.

23956 (UCRL-JC–111377) **Measurements of the thermal radiative properties of liquid uranium.** Havstad, M.A. (Lawrence Livermore National Lab., CA (United States)); McLean, W. II; Self, S.A. Lawrence Livermore National Lab., CA (United States). Jul 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920804–27: 28. national heat transfer conference, San Diego, CA (United States), 9-12 Aug 1992). Order Number DE93012595. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements of the thermal radiative properties of liquid uranium have been made using an instrument with two optical systems, one for measuring the complex index of refraction by ellipsometry, the other for measuring the normal spectral emissivity by direct comparison to an integral blackbody cavity. The measurements cover the wavelength range 0.4 to 10 μm with sample temperatures between 940 and 1630 K. Two 5keV ion sputter guns and an Auger spectrometer produce and verify, in-situ, atomically pure sample surfaces. Good agreement between the two methods is observed for the normal spectral emissivity, which varies with wavelength in a manner typical of transition metals. The two components of the complex index of refraction, the index of refraction and the extinction coefficient, increase with wavelength, from ~3 at 0.4 μm to ~20 at 9.5 μm. Both components of polarized reflectivity are shown for visible to infrared wavelengths.

23957 (UCRL-JC–112060) **Statics and kinetics of phase transformations in bcc Fe-Cr.** Reinhard, L. Lawrence Livermore National Lab., CA (United States). 17 Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206202–7: NATO advanced study institute on statics and dynamics of alloy phase transformations, Rhodes (Greece), 21 Jun - 3 jul 1992). Order Number DE93013839. Source: OSTI; NTIS; GPO Dep.

The Fe-Cr phase diagram exhibits a bcc solid solution (α-Fe-Cr) in a wide concentration range at high temperatures. This paper present applications of the Monte Carlo method in the framework of the three-dimensional Ising model to the problem of phase separation in α-Fe-Cr and compare the simulation results with experiment. (DCL)

23958 (UCRL-JC–112518) **Progress in zirconium resonance ionization spectroscopy.** Page, R.H.; Dropinski, S.C.; Worden, E.F. Jr.; Stockdale, J.A.D. Lawrence Livermore National Lab., CA (United States). 29 Dec 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–25: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93011881. Source: OSTI; NTIS; GPO Dep.

We have examined the stepwise-resonant free-photon-ionization spectrum of neutral zirconium atoms using three separately-tunable pulsed visible dye lasers. The ground-level (first-step) transitions were chosen on the basis of demonstrated ^{91}Zr selectivity. Lifetimes of even-parity levels around 36000 cm^{-1}, measured with the delayed-photoionization technique, range from 10 to 100 ns. Direct ionization cross sections appear to be less than 10^{-17} cm^2; newly-detected autoionizing levels give peak ionization cross sections (inferred from saturation fluences) up to 10^{-15} cm^2. Portions of Rydberg series converging to the 315 and 763 cm^{-1} levels of Zr$^+$ were identified. "Clumps" of autoionizing levels are thought to be due to Rydberg-valence mixing.

23959 (WAPD-TM–1427) **Interaction of thermo-mechanical processing parameters and stress corrosion cracking for two heats of Ni-Cr-Fe Alloy 600.** Lynn, J.P.; Webb, G.L. Bettis Atomic Power Lab., West Mifflin, PA (United States). Feb 1984. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-89PN38014. Order Number DE93012177. Source: OSTI; NTIS; GPO Dep.

The relationship between hot rolling parameters, annealing parameters, microstructures and stress corrosion cracking behavior of Ni-Cr-Fe Alloy 600 in deaerated primary plant grade water at 680°F was investigated. A high carbon (0.07%) and a medium carbon (0.04%) heat were hot rolled 20% or 80% starting at 3 different temperatures: below, near, and above the carbide solvus followed by annealing for 1 or 4 hours at a nominal temperature of 1600°F or 1900°F. Materials that are resistant to stress corrosion cracking were produced by hot rolling above the carbide solvus temperature followed by annealing at high temperatures (>1900°F). A combination of hot rolling below carbide solvus, large rolling reduction and a short annealing at a low temperature produced materials susceptible to stress corrosion cracking, especially for the high carbon heat. The resistant materials have by optical metallography as having carbide decorated grain boundaries, little intragranular carbide precipitation and good grain-boundary correlation between a nital and a phosphoric acid etch. The susceptible materials as lack grain boundary carbide precipitation, have heavy intragranular carbide precipitation and lack grain boundary correlation between a nital and a phosphoric acid etch.

23960 (WSRC-MS–93-037) **Acceptance criteria for corroded carbon steel piping containing weld defects.** Mertz, G.E.; Lam, P.S.; Awadalla, N.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930702–18: Pressure vessel and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93011703. Source: OSTI; NTIS; INIS; GPO Dep.

Acceptance criteria for corroded low temperature, low pressure carbon steel piping containing weld defects is presented along with a typical application of these criteria. They are intended to preclude gross rupture or rapidly propagating failure due to uniform wall thinning, local wall thinning, pitting corrosion and weld defects. The minimum allowable uniform wall thickness is based on the code-of-record allowable stress and fracture criteria. Weld defects are postulated as potential sites for fracture initiation. CEGB/R6 failure assessment diagram is used as the fracture criteria to determine the minimum allowable wall thickness. Design of a large portion of the low temperature, low pressure piping is dominated by axial stresses. Existing local wall thinning acceptance criteria address high pressure piping where hoop stress dominates the design. The existing criteria is over conservative, in some cases, when used on low pressure piping. Local wall thinning criteria is developed to limit the axial stress on the locally thinned section, based on a reduced average thickness. Limits on pit density are also developed to provide acceptance criteria for pitted piping.

23961 (WSRC-MS–93-090) **Welding tritium aged stainless steel.** Kanne, W.R. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9304103–5: Department of Energy (DOE) compatibility, aging and service life conference, Aiken, SC (United States), 20-22 Apr 1993). Order Number DE93011782. Source: OSTI; NTIS; INIS; GPO Dep.

Stainless steels exposed to tritium become unweldable by conventional methods due to He buildup within the metal matrix. With longer service lives expected for new weapon systems, and service life extensions of older systems, methods for welding/repair on tritium-exposed material will become important. Results are reported that indicate that both solid-state resistance welding and low-heat gas metal arc overlay welding are promising methods for repair or modification of tritium-aged stainless steel.

23962 (WSRC-TR–92-472) **A survey of techniques for corrosion monitoring.** Mickalonis, J.I. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012131. Source: OSTI; NTIS; INIS; GPO Dep.

Corrosion monitoring techniques have improved with advances in instrumentation technology and corrosion research. Older techniques, such as coupon immersion, generally provide historical information. The new electrochemical techniques, which have not been used widely at SRS, allow on-line monitoring and correlation with process changes. These techniques could improve the corrosion assessment of the waste tanks to be used for In-Tank Precipitation and Extended Sludge Processing. A task was initiated to place an electrochemical probe into tank 48 for testing the utility of this technique for waste tank applications.

23963 (Y–2457-3) **Y-12 Development Division technical progress report: Part 3, Metal processing period ending December 1, 1992.** Northcutt, W.G. Jr. (comp.). Oak Ridge Y-12 Plant, TN (United States). 26 Jan 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE93011836. Source: OSTI; NTIS; GPO Dep.

Type 1020 mild steel, IF-steel®(registered trademark of Armco Steel Corporation, Middletown, Ohio), and TI-Namel were exposed in molten lithium hydride (LiH) at 800C for cumulative times approaching 300 h. Mild steel decarburized at an extreme rate with the affected area exhibiting tremendous grain growth. In contrast, IF-steels® and TI-Namel do not experience decarburization or grain growth during identical exposures to LiH. All three steels experience net weight gains during extended exposure, and the data suggest that lithium penetration into the steel is the primary source of weight gain.

23964 (ANL/OTM/CR–3) **Wear-mechanism modelling: Final report.** Ashby, M.F. (Cambridge Univ. (United Kingdom). Dept. of Engineering). Argonne National Lab., IL (United States); Cambridge Univ. (United Kingdom). Dept. of Engineering. Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93012311. Source: OSTI; NTIS; GPO Dep.

Goals of the program are to calculate the surface temperatures in dry sliding, develop a soft wear tester for ceramics, survey the wear mechanisms in brittle solids, and couple the temperature calculations with models to give wear maps for brittle solids. (DLC)

23965 (CONF-9209221–, pp. 149-178) **Positron lifetime spectroscopy in oxides.** Pareja, R. (Universidad Carlos III de Madrid (ES)); Gonzalez, R. Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Experiments made in the past years have established that positron annihilation spectroscopy (PAS) can give information on the characterization and analysis of crystalline oxides to be used in energy-efficient devices. In these materials, a number of processes, ranging from the aggregation of vacancy-type defects in neutron irradiated crystals to the formation of bound states [e^+-H^-] when positrons are trapped by H^- ions, were studied by PAS. Work done in three systems is emphasized in this presentation: (1) Ceramic oxides, the importance in the development of fusion reactors; (2) ZnO crystals, the application in varistors and in electro-optics; (3) Cu_2O crystals, important constituent in the superconducting oxides. The materials of the first system are very good insulators while those of the second and third are semiconductors.

23966 (CONF-930513–2) **Fast Fourier Transform analysis of computer-acquired friction data.** Yust, C.S. Oak Ridge National Lab., TN (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual conference and exhibition of the Society of Tribologists and Lubrication Engineers; Calgary (Canada); 17-20 May 1993. Order Number DE93010337. Source: OSTI; NTIS; GPO Dep.

A commercial computer program for data acquisition and analysis has been used to facilitate the evaluation of the frequency content of friction force data obtained from a sliding wear test. The program uses a Fast Fourier Transform (FFT) algorithm to calculate the frequency spectrum of the friction force. The validity of the FFT program has been demonstrated by applying it to a recently published example that used a detailed mathematical treatment to remove an oscillatory component from friction data. When applied to friction force data from a pin-on-disk sliding wear test of NBD 200 silicon nitride sliding on NBD 100 silicon nitride, filtering of the dominant frequencies revealed by the FFT method reduces both the general dispersion of the friction values and almost completely eliminates localized signal perturbations. Successive filtering steps permit the association of particular frequencies with observed signal disturbances. Although the mean friction value in this example is not greatly altered by the frequency filtering, knowledge of the existing vibration frequency components in the tribosystem is important for a complete interpretation of wear mechanisms and for characterization of the machine/specimen interaction.

23967 (CONF-930783–1) **Microanalysis of directionally solidified cobalt oxide-zirconia eutectic.** Bentley, J. (Oak Ridge National Lab., TN (United States)); McKernan, S.; Carter, C.B.; Revcolevschi, A. Oak Ridge National Lab., TN (United States). [1993]. 2p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United

States). DOE Contract AC05-84OR21400 ;AC05-76OR00033. Grant: DMR-8901218. From 27. Microbeam Analysis Society meeting; Los Angeles, CA (United States); 11-16 Jul 1993. Order Number DE93013207. Source: OSTI; NTIS; GPO Dep.

Analytical electron microscopy (AEM) was performed with a AEM equipped with a field emission gun, an electron energy-loss spectrometer, and an energy-dispersive x-ray spectrometer. The microstructure consists of alternating lamellae of CoO and Ca- stabilized cubic-ZrO_2, each up to 1μm wide, and a thin (100- 200 nm) irregular layer of Co_3O_4 spinel extending into the CoO from the flat ZrO_2 interface. (DLC)

23968 (CONF-930822–5) **Flux-pinning related defect structures in melt-processed $YBa_2Cu_3O_{7-x}$.** Wang, Z.L.; Kontra, R.; Goyal, A.; Kroeger, D.M.; Allard, L.F. Oak Ridge National Lab., TN (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the Electron Microscopy Society of America; Cincinnati, OH (United States); 1-6 Aug 1993. Order Number DE93012759. Source: OSTI; NTIS; GPO Dep.

(HREM was used.) Stacking faults lying parallel to the (001) basal plane are observed near the Y211/Y123 (Y_2BaCu_5O/$YBa_2Cu_3O_{7-\delta}$) interfaces in Y123. These stacking faults are produced by either excess single Cu-O layers or double Cu-O and Y-O layers. Y enrichment and Ba depletion were observed near the Y211/Y123 interface; this is consistent with dissolution of trapped Y211. Such diffusion effects and stress due to lattice mismatch at Y211/Y123 interfaces may be the mechanisms for generating stacking faults around the Y211 particles in the Y123 matrix. A new type of defect with displacement vector 1/6[032] or 1/6[302] was also observed. (DLC)

23969 (DOE/ER/13560–7) **Investigation of PACVD protective coating processes using advanced diagnostics techniques: Performance report, 1 September 1992–30 April 1993.** Roman, W.C. United Technologies Research Center, East Hartford, CT (United States). 7 May 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13560. Order Number DE93013978. Source: OSTI; NTIS; GPO Dep.

Objective is to understand the mechanisms governing nonequilibrium plasma atomistic or molecular deposition of hard face coatings. Laser diagnostic methods include coherent anti-Stokes Raman spectroscopy (CARS) and laser-induced fluorescence. TiB_2 and diamonds were used as the hard face coating materials. Diborane was used as precursor to TiB_2.

23970 (DOE/ER/13906–5) **[The molecular precursor strategy for the production of superconducting oxides]: Progress report.** Caulton, K.G. Indiana Univ., Bloomington, IN (United States). Dept. of Chemistry. Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13906. Order Number DE93015881. Source: OSTI; NTIS; GPO Dep.

$Cu(I)_2Zr_2(OR)_{10}$ (R=i-Pr) was prepared and reacted with O_2 and H_2O to form $Cu(II)_4Zr_4O_3(OR)_{18}$. This latter, layer-like compound show both ferro- and antiferro-magnetic coupling of adjacent d_9 Cu(II) centers through bridging O^{2-} and RO^- mediators, respectively. Thermolysis of $ClCuZr_2(OR)_9$ and $Cu_2Zr_2(OR)_{10}$ shows two sharp weight losses at <400 C to give Cu(0) and ZrO_2. Synthesis and characterization of $Na_2(THF)_4Cu[OCH(CF_3)_2]_4$ and $Na(THF)_2Cu[OC(CH_3)(CF_3)_2]_3$ are reported. Effect of chemical modification of a fluorinated alkoxide group on yttrium precursor identity was investigated.

23971 (DOE/ER/45147–8) **High resolution electron energy loss studies of surface vibrations: Progress report, November 1, 1990–May 1, 1993.** Kesmodel, L.L. Indiana Univ., Bloomington, IN (United States). May 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER45147. Order Number DE93014441. Source: OSTI; NTIS; GPO Dep.

New experimental investigations of surface vibrational properties of materials with high-resolution electron energy loss spectroscopy (EELS) axe reported. This document summarizes progress over the last three year project period on surface phonon measurements on copper (001); silver (111); ultrathin magnetic films; aluminum on silicon (111); and copper-oxide based superconductors.

23972 (DOE/ER/45228–65) **Surfaces and interfaces of ceramics and metals: [Final] report, July 1988–November 1992.** Arizona State Univ., Tempe, AZ (United States). 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45228. Order Number DE93014959. Source: OSTI; NTIS; GPO Dep.

Structures of surfaces of several ceramic oxides were studied by use of reflection electron microscopy (REM) and associated techniques. High-temperature annealing in air or oxygen gives smooth, flat crystal faces in most cases, including the (111) MgO surface, previously thought to be facetted. Stability of the (111) MgO surface is shown to be due to a surface superlattice reconstruction. Surface superlattices, stable in air, have also been shown to exist on sapphire and rutile crystal faces. The segregation of Ca to the surface of MgO has been studied using reflection electron energy loss techniques. Initial studies of Cu-Au alloy crystal surfaces, necessarily carried out in ultra-high vacuum, have been made using RHEED and Auger electron spectroscopy. Clean alloy surfaces show surface reconstructions associated with the segregation of Au atoms at the surface. High-temperature annealing results in the segregation of sulfur to the surface and the formation of a variety of surface superlattice structures. Structures of solid-solid interfaces have been studied using a wide variety of electron-optical techniques including nanodiffraction and electron holography. In particular the interfaces in semiconductor multiple quantum well structures and also multilayer structures of Si and Co have been studied.

23973 (DOE/ER/45359–2) **The study of structure-processing-property relations in copper oxide based high $T_c$superconductors: Progress report, July 1992–June 1993.** Kingon, A.I. Order Number DE93015066. Source: OSTI; NTIS; GPO Dep.

Objective is investigation of critical current limiting processes in bulk superconductors. Since the grain boundaries play a key role here, we focus on the electrical characterization of single grain boundaries. Electrical contact to thin polished sections is established with thermosonic wire bonding. Laser cutting is used to isolate a single grain boundary. Results on $YBa_2Cu_3O_x$ showed that two different types of grain boundaries are present. Most grain boundaries showed current voltage characteristics typical for flux pinning effect and no or little change in low magnetic fields. However, Josephson effect could also be found in some grain boundaries exhibiting a remarkable decrease of I_c in low magnetic fields. Both types could be found in the same sample. Additionally we are working on $Bi_2Sr_2CaCu_2O_x$ thick films grown on silver foil or MgO substrates. The films showed metallic behaviour and T_c=80K. Preliminary results showed that the grain boundaries are of the flux pinning type.

Rare-earth transition metal nitrides and carbides have been prepared by gas-solid reaction with N and HC gases. Neutron diffraction was used to study changes in structure which accompany the nitridation. In $NdFe_{10}Mo_2N_x$, nitrogen occupies the base center site (1/2, 1/2, 0) of the tetragonal unit cell with 84% occupancy. Two crystal structure types were found in $LaFe_{13-x}Si_x$; nitridation of the cubic phase expanded the unit cell by 6.2-10.8%, leading to increases in Curie temperature and spontaneous magnetization. The interstitial N atom from nitridation expanded the unit cell volume of $NdFe_{10}Mo_2$ by 3%; the Curie temperature reached 563 K. Magnetically hard $NdFeMoN_x$ with coercivity 8.8 kOe at RT and 33.7 kOe at 10 K were obtained by nitriding melt-spun ribbons.

23975 (IS-M–744) **Particle attraction effects on the centrifugal casting and extrusion of alumina.** Schilling, C.H. (Ames Lab., IA (United States)); Bergstroem, L.; Ker, H.L.; Aksay, I.A. Ames Lab., IA (United States). [1993]. 17p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-930438–4: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93011559. Source: OSTI; NTIS; INIS; GPO Dep.

Interparticle attraction forces were empirically related to the centrifugal casting and extrusion behavior of flocculated alumina suspensions. Attractive forces were altered by two approaches: Salt flocculation, which entails regulating the electrical double-layer thickness through electrolyte additions; and screening of van der Waals attraction by steric interactions of surface-adsorbed fatty acids. Specimens produced by both compressibility at a critical maximum density that increased with decreasing interparticle attraction. Gradients in packing density during centrifugal casting were alleviated using both methods as long as spatial variations of the effective stress were within the low-compressibility range. We hypothesized that the reduced interparticle attraction in both methods may also raise the threshold packing density at which ductile-to-brittle transitions occur during plastic shear. Specimens prepared with oleic acid adlayers were highly plastic and easily extrudable at solids contents of up to 59 vol%, although salt-flocculated samples at 55 vol% density extruded at creeping flow rates that were insensitive to the applied pressure. Results suggested that particle rearrangement during shear, is a rate-limiting process, with an average relaxation time that is lowered by reducing interparticle attraction.

23976 (LA–12520) **Prediction of alumina penetration.** Mandell, D.A. Los Alamos National Lab., NM (United States). Feb 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014017. Source: OSTI; NTIS; GPO Dep.

The MESA hydrocode was used to predict two-dimensional tests of L/D 10 and L/D 15 tungsten rods impacting AD 90 alumina with a steel backing. The residual penetration into the steel is the measured quantity in these experiments conducted at the Southwest Research Institute (SWR). The interface velocity as a function of time between an alumina target and a lithium fluoride window, impacted by an alumina disk at velocities between 544 m/s and 2329 m/s, was also predicted. These one-dimensional flyer plate experiments were conducted at Sandia National Laboratories using Coors AD 995 alumina. The material strength and fracture models are important in the prediction of ceramic experiments. The models used in these predictions are discussed. The penetrations in the two-dimensional tests were predicted to 11.4 percent or better. In five of the six experiments, the predicted penetration depth was deeper than the measured value. This trend is expected since the calculation is based on ideal conditions. The results show that good agreement between the 1-D flyer plate data and the MESA predictions exists at the lower impact velocities, but the maximum velocity is overpredicted as the flyer plate velocity increases. At a flyer plate velocity of 2329 m/s the code overpredicted the data by 12.3 percent.

23977 (ORNL/FTR–4568) **[A trip to Japan to present a lecture entitled "The DOE Ceramic Technology Project – 10 Years of Progress"]: Foreign trip report, March 12–20, 1993.** Johnson, D.R. Oak Ridge National Lab., TN (United States). 1 Apr 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011585. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler presented an invited lecture at the annual conference of the Japan fine Ceramics Program. Visits for the purpose of technical discussions were made to Keio University; Toyota Central Research and Development Laboratories, Inc.; Japan Fine Ceramics Center; Government Industrial Research Institute - Nagoya; Mechanical Engineering Laboratory; and the National Institute for Research in Inorganic Materials. A summary of these activities is included in this report.

23978 (SAND–93-0582C) **Amorphous sol-gel insulating films.** Brinker, C.J. (Sandia National Labs., Albuquerque, NM (United States)); Warren, W.L.; Logan, M.N.; Ashley, C.S. Sandia National Labs., Albuquerque, NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921101–114: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93012859. Source: OSTI; NTIS; GPO Dep.

The porosity of sol-gel thin films may be tailored for specific applications through control of the size and structure of inorganic polymers within the coating sol, the extent of polymer reaction and interpenetration during film formation, and the magnitude of the capillary pressure exerted during the final stage of drying. By maximizing the capillary pressure and avoiding excessive condensation, dense insulating films may be prepared as passivation layers on silicon substrates. Such films can exhibit excellent dielectric integrity, viz., low interface trap densities and insulating properties approaching those of thermally grown SiO_2. Alternatively, through exploitation of the scaling relationship of mass and density of fractal objects, silica films can be prepared that show a variation in porosity (7–29 %) and refractive index (1.42–1.31) desired for applications in sensors, membranes, and photonics.

23979 (UCRL-ID–113715) **Project proposal for partial computational physics support for Survivability of Coatings program.** Rhoades, C.E. Jr. Lawrence Livermore National Lab., CA (United States). Mar 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013788. Source: OSTI; NTIS; GPO Dep.

Currently, the Survivability of Coatings (SOC) program uses the XRT computer code to calculate the effects of X-rays of various spectra on mirrors consisting of one or more optical coatings of specified thicknesses over various substrates. The following physical processes are modeled by XRT in one spatial dimension: (a) X-ray deposition and transport, (b) electron production, deposition and transport, (c) thermal conduction and transport, and (d) resulting static and dynamic stress and deformation. In general, the numerical techniques used in XRT are deterministic ones: X-ray transport is handled by multigroup discrete ordinates, electron transport is performed by the method of characteristics applied to a two term spherical harmonics expansion approximation (PI) of the Spencer-Lewis transport equations and thermal transport is done by a simple Richardson extrapolation of a backward Euler solution to the heat conduction equation. XRT has been used for both preshot and postshot analyses of samples for both aboveground tests (AGT) and underground tests (UGT). Agreement of analyses with experiment has been reasonably good. However, several samples predicted not to fail did appear to be damaged in a recent UGT. In addition, at least one sample predicted to fail did not. Preliminary analysis of the experimental samples on the recent AGT performed at Maxwell Laboratories in San Diego for the SOC program shows similar difficulties.

23980 (UCRL-JC–106137) **Effect of Y on cation and anion grain boundary diffusion in chromia.** King, W.E. (Lawrence Livermore National Lab., CA (United States)); Park, J.H. Lawrence Livermore National Lab., CA (United States). Jan 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-890977–3: International congress on intergranular and interphase boundaries in materials, Paris (France), 4-8 Sep 1989). Order Number DE93013837. Source: OSTI; NTIS; GPO Dep.

Cation and anion diffusivities in the lattice and along grain boundaries have been measured on sintered polycrystals of Cr_2O_3 and Cr_2O_3-0.09 weight percent Y_2O_3 at 1100 C and at the oxygen partial pressure corresponding to that of the Cr/Cr_2O_3 equilibrium at that temperature. Results show the effect of Y is to enhance cation grain boundary diffusion. It was also observed that under the same conditions, anion diffusion is significantly faster than cation diffusion. Results are discussed in terms of their implications for the reactive element effect on high temperature oxidation of chromia forming alloys.

23981 (UCRL-JC–111025) **Formation of textured YBCO films by laser ablation.** Jankowski, A.F.; Olsen, B.L. Lawrence Livermore National Lab., CA (United States). Nov 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921101–118: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United

States), 30 Nov - 5 dec 1992). Order Number DE93013131. Source: OSTI; NTIS; GPO Dep.

Yttrium-Barium-Cooper-Oxide (YBCO) thin films are prepared using laser ablation. The <100> orientation of the 0.2–0.3 μm thin film is controlled using both substrate temperature and deposited buffer layers for epitaxial growth. Highly textured films are prepared with a c-axis preferred orientation using substrates of $SrTiO_3$ (100) and MgO (100) at a temperature of 780°C whereas a,b-axis films result if a 100nm buffer of Praseodymium-Barium-Copper-Oxide is first deposited at 700 C. The use of a 15nm buffer layer of $SrTiO_3$ on MgO (100) produces films with superconducting transitions equivalent to those YBCO films deposited directly on $SrTiO_3$ (100) substrates.
